

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

MR. GEO. THOS. CONGREVE'S TREATMENT.

CASE OF "HOPELESS PHTHISIS"

BROUGHT HOME TO DIE!

BUT CURED! BY THE TREATMENT OF
Mr. GEO. THOS. CONGREVE.

"DEAR SIR,—I have much pleasure in writing you to say that one of my sons, whose life was despaired of in consequence of Consumption having supervened an attack of inflammation of the lungs, has been completely restored to health by your invaluable treatment. I cannot speak too highly of your medicine, for a more complete and wonderful cure, I think, has never been effected by any other medicine. My son returned home in a hopelessly dying state. By accident I heard of your remedy, and determined to try it. My wife and other members of my family were surprised and delighted to notice some change for the better, after a few days only; and in a few months, I am glad to say, my son was entirely restored to health, and is now one of the strongest and most robust of our family.

"As the publication of this case would, I think, do much good, you can make any use you like of this letter, &c. I shall write an account to my relatives living in Tasmania and Queensland, and should suggest your inserting this in the papers there.—I am, dear Sir, yours gratefully, JOHN B. HARDWICKE, Selby Villas, Prettlewell Street, Southend, Essex."

In confirmation of the above, Mr. Hardwicke has sent me the certificate of his son's discharge from the Royal Navy: "Sydney Hardwicke *invalided; case, Pneumonic Phthisis.*" Also a certificate as to his present state of health from a surgeon at Southend:—"I hereby certify that Sydney Hardwicke is sound in body and of good constitution."—9th August, 1892.

THE MIRACLE OF THE MAID OF ORLEANS.

ENTRY OF JEANNE D'ARC INTO THE CITY OF ORLEANS, APRIL 28TH, 1429.

THE PROGRESS OF THE WORLD.

LONDON, *July 1, 1893.*

The Marriage of the Nations. The marriage of Prince George to Princess May has sent a ripple of social and personal interest over the land, which not even the somewhat arbitrary levy which custom enforces for wedding presents has been able altogether to dash. But the marrying and giving in marriage even of the most estimable young persons of the Royal caste cannot for a moment compare in importance to the progress that was made last month towards the marriage of the nations which speak the English tongue. If we look upon the world-drama as we should look upon any tragedy on the boards of a theatre, it is obvious that its interest centres in the fortunes of the two leading personages—Britain and America. For the last hundred years the play has turned on the story of their alienation, their differences, and their misunderstandings. But with the Alabama Arbitration a change came over the spirit of the scene which all story-tellers and dramatists lead us to expect when they are about two-thirds through their plot. The estranged lovers begin to draw together again. They discover that many deadly affronts were merely ridiculous misconceptions. Prejudices born of conflict melt in the sun of restored confidence, and the experienced observer knows that he is within a measureable distance of the time when the hero and heroine will marry and live happily ever afterwards.

The Budding of the Orange Blossoms. Without attempting to decide whether of the Orange Britain or America is the hero or the heroine in this great romance of the century, it would really begin to appear that their reunion is going to come about after all. The debate

on the proposed treaty of International Arbitration last month in the House of Commons, when a resolution was unanimously passed in favour of meeting the friendly overtures of the American Government for the conclusion of a permanent treaty of Arbitration,

was a sign of the budding of the orange blossom, that familiar symbol of the coming bridal. Mr. Cremer, Sir John Lubbock, and the Peace Society have for years pressed this resolution upon Parliament, but it was not till last month that Mr. Gladstone—and with Mr. Gladstone the House of Commons—woke up to the discovery that what had previously been declared to be impossible, unconstitutional, and most inexpedient, had now become so obviously desirable that not a single

MR. W. R. CREMER, M.P.

hostile vote could be registered against the motion. The two English-speaking peoples are now both committed to the principle of binding themselves in advance by treaty to submit all disputes to arbitration. They have already referred the Alabama and Behring Sea controversies to arbitration; but the new departure that is contemplated is to substitute for such haphazard references agreed to at the caprice of a Secretary of State for the time being, the solemn obligation of a permanent treaty binding both parties to resort to arbitration for the settlement of their disputes. From that to the constitution of the permanent international High Court which will be the wedding ring of Britain and America, there is but a short and easily traversed road.

There are some who look still further ahead. Mr. Andrew Carnegie is not exactly the supreme type of the fairy match-maker who presides over the love affairs of

Publishing the Banns.

nations. But Mr. Carnegie is a shrewd man and very practical. He was born a Scotchman, is naturalised an American, and he divides his year between his Highland residence under the Monarchy and his country house in the Republic. He knows personally the leading Republican statesmen of the West and the most influential Liberal Ministers of the Queen. He is a protectionist of the protectionists in America, a millionaire whose wealth is largely believed to be due to the heavy duties which excluded British iron and steel from the American market. But this is the man who, in the article entitled "A Look Ahead," which I notice elsewhere, proclaims the banns between the Republic and the Empire, and offers as a solid and material consideration the establishment of free trade between dominions of the Queen and the States of the American Commonwealth. From whatever point of view this may be regarded, it is significant and encouraging. It would really seem as if the beautiful dream of 1883 were about to be materialised into actual fact before the end of the century.

If the great blunder of the Third George [Mr. Astor. is to be undone, if the Empire and the Republic after a hundred years of estrangement are to be reunited, so as to constitute a single state—so far as the rest of the world is

MR. W. W. ASTOR.

concerned—then it is evident that the hour has come for the appearance of a new factor on the scene in the shape of British-Americans in Britain and American-Britons in America, men jointly representing both countries and owing allegiance both to Empire and

to Republic, as Minnesotans to Minnesota, or as Welshmen to Wales, but whose real fatherland is the English-speaking world. A few of us here and there in the press and in the pulpit have long ago proclaimed our adhesion to this saving faith. But what is wanted is a person or persons who will stand forth before the two countries as the champion of the great cause, and use their personal influence, social position, and all and every other means at their disposal to work for the reunion of English-speakingdom, as scores and hundreds of other men use their lives in working for their particular party, sect, or faction. The difficulty is that it takes a very big man to work for a very big idea. We make our gods in our own image, and the idols of the market-place and the forum are adjusted to our own stature. But the English-speaking idea is one of the biggest that ever fired the imagination of mankind, and that is one of the reasons why people are asking themselves whether Mr. Carnegie could be right in urging Mr. W. W. Astor to shoulder the responsibilities of his unique position and place himself at the head of the movement for the reunion of the English-speaking race. Mr. Astor has great advantages for playing such a part. He has wealth without envy, he comes of a good breed, he has the sense of responsibility—all that is good. He is also not without ambition, social and journalistic, as his recent adventures prove. But whether he is man enough for this other work time alone can show.

The Turn where we may, we find evidence of the Americanisation of British institutions. The Australian banks are re-constituting themselves on an American basis. Mr. Rhodes announces at the Cape that he is studying the American immigration laws with a view to restricting the landing of Asiatics. But it is in England and at Westminster that the tendency is most perceptible. Mr. Gladstone—most unfortunately for his cause—began by framing his Home Rule Bill with an eye not to American, but to Colonial precedents. That was the root of all his errors, the cause of all his embarrassments. For the difference between Colonial and American precedents is simply this—that the Colonial constitutions were drawn up with the view of enabling the colonies to become independent States, while the American constitution, as interpreted by the great Civil War and its corollaries, is based upon the principle of keeping together in indissoluble federation States which in their own domestic affairs are independent.

Home Rule on Colonial lines meant—and means—an Ireland ripening for separation and independence. Home Rule on American lines meant—and means—Ireland left free to manage her own affairs, in order that she may be more indissolubly bound up with the fabric of the Empire. In the debates of last month it was evident that Mr. Gladstone still clung to his Colonial precedents—but with a relaxing grasp. The Opposition, on the other hand, are pressing him hard with arguments and analogies drawn from Washington, and the issue is not doubtful. Colonial Home Rule will never be applied to Ireland; but American Home Rule—Home Rule as a basis for federation—comes nearer every day.

The Progress of the Home Government will discover the wisdom of Rule Debate. Possibly by the middle of this month the principle which last October has pressed upon them in vain here and elsewhere. That principle was the very obvious one, that they should not attempt to legislate upon any branch of the Irish question upon which they had not got a majority in the House of Commons. Ignoring this prudent counsel, Mr.

of 1886 differed from his financial scheme of 1890, and that again has been modified by the discovery of fatal flaws in the figures vitiating all his calculations. So it is now proposed that for six years, while the new Government is finding its feet and learning its business, the finances shall remain as at present in the hands of the Imperial Government, and it is understood that as a natural corollary of this decision Clause 9 will be excised holus bolus from the Bill. Surely it would have been more sensible to have taken this course from the first. One thing at a time. They stumble who run too fast. But when the journalist pressed these considerations on the statesman nine months since, the latter would not listen, with such results as are now before us.

The Home Rule Bill was discussed **Blocked.** all last month, with the result that the Committee has just got to the fourth Clause, and the majority impatiently chafes and fumes, and talks of guillotining the Bill through the House. The guillotining process is that which was applied by the late Government to drive their Coercion Bill through Committee. Notice is given that after a certain day debate will cease, and the House will divide without debate upon all amendments still on the paper. It is the gag applied in the most brutal fashion; and it was noted as an evil precedent when Mr. Balfour employed it by the very men who are now clamouring for its adoption to thrust the Home Rule Bill through Committee. If the majority wished to shorten debate without giving the House of Lords a plausible pretext for rejecting the Bill, they can adopt many less objectionable measures than the guillotine. They can, for instance, limit the length of speeches, say to ten minutes, with occasional exceptions by special permission, and they can fix a fair and reasonable limit to the duration of a debate on any amendment or clause, and they can refuse to debate at all any amendment which is manifestly and only obstructive. Ministers have adopted a modified guillotine policy, but it will probably not help them so much as would a decision to lighten the Bill as much as possible of all controversial top-hamper, and to send up the irreducible minimum of clauses conceding Home Rule to the Peers. This would be good policy in any case: it is obviously our only policy when it is quite accepted that the Peers will throw it out, no matter in what shape it comes before them.

This block in the House of Commons is **Paying the Penalty.** the penalty of the policy of silence which Mr. Gladstone pursued during the years of opposition. Mr. Gladstone is an old parlia-

From the Birmingham Daily.

[June 23, 1893.]

THE GREAT OBSTACLE RACE.
Will he ever get through?

Gladstone persisted in binding up the establishment of an Irish Parliament—which is not to be called a Parliament—with an alteration of the constitution of the Parliament at Westminster and a readjustment of the financial relations of the two countries. It is around these two subjects that the battle has hitherto raged. On the financial question Mr. Gladstone was so far from having a majority of his own party, that he has not even been able to maintain his own equilibrium. His financial scheme

mentary hand, and no one can give him a lesson in strategy; but it may be permitted even to the humblest of his followers to point out that the result of refusing to discuss in advance in the press and on the platform the principles of his Home Rule scheme has been to choke the House of Commons with the consideration of a multitude of questions which had not been practically debated before. If, instead of being dieted morning, noon, and night for five years with the massacre of Mitchelstown and the infamies of Coercionist Balfour, our leaders had discussed the practical difficulties of finance and representation, and had familiarised the country not merely with the case for Home Rule, but with the arguments in favour of the particular scheme of Home Rule which he favoured, there would have been more justification for the clamour for the closure and the guillotine. There were tactical advantages of an obvious nature in favour of keeping the Home Rule pig in the Gladstone poke; but, like everything else in this world, they have their price, and to-day, with July upon us and the fifth Clause still undisposed of, is it no wonder that many of us are beginning to ask whether the advantages of preventing preliminary debate during the years when we were in opposition were not bought too dear by the limitless field which is now opened to debate which cannot seriously be condemned as obstructive, inasmuch as it is the first real discussion of the practical questions involved in Home Rule?

Irish Restiveness.

Under the pressure of the prolonged debate the Government have made some minor concessions to the Opposition, with the result that the Irish are beginning to be restive. Mr. Sexton protested on one occasion against the growing habit of concession, and Mr. Redmond and the Parnellites have revolted

altogether against the proposed postponement of the financial question for six years. But Mr. Redmond's revolt does not go further than the addressing of a manifesto to the Irish Americans, while the dissatisfaction of the other party is more with appearances of things than with their substance. The Irish are shrewd enough to see the drift of events, and as they have no objection to American Home Rule, they have every reason to be satisfied with the way things are going.

From Judy.]

VERY SICKLY.

[June 14, 1893.]

The mutterings of discontent on the guillotine.

part of many of his supporters, emphasized by a slight reduction in the Liberal majority at Pontefract, decided Mr. Gladstone to make a desperate effort to extricate his Bill from the thicket. So in the last days of June it was proclaimed with great beating of tom-toms that Ministers were about to complete the revolution in Parliamentary procedure which was begun when Mr. Parnell first made the closure indispensable. Hitherto the right of closing debate has been vested in a majority subject to the discretion of the Speaker or the Chairman of Committees, who seldom acted in important cases excepting on the initiative of a Minister of

the Crown. The Liberals denounced Mr. Smith in 1887 when he thrust the Coercion Bill through by a departure from this rule, and now they shelter themselves behind the precedent which they denounced. Henceforth a Minister with a majority is to be allowed to fix a date for closing, not any particular debate on any particular clause, but for closing the consideration of the whole subject. Mr. Gladstone, for instance, wishes to get the Home Rule Bill through Committee by July 27th. He therefore allocates so much time to this, that, or the other section of the Bill. Clauses 5 to 8 must, for instance, be disposed of by the 6th of July; clauses 9 to 26 by the 13th;

clauses 27 to 40 by the 20th; new clauses, etc., by the 27th. On each of these dates the guillotine drops, and all amendments still outstanding are to be voted upon without further debate. There is to be no longer any waiting for the permission of the Speaker to close debate. Ministerial exigencies are to be the sole law of the House, and the minority is to rest content with the sole real right of a minority—that of liberty to convert itself into a majority as soon as it can.

Judging from precedent, Ministers will fail to get their Bill through before July 27. They have never fixed a date yet for getting through any stage of this measure that they have been able to keep. Even if the Opposition were to acquiesce in the policy of the gag and the guillotine, it is extremely doubtful whether the Ministerialists themselves would not require more time in which to discuss the latest version of the Government Bill. For the Bill which was read a first and second time is not the Bill which is now before the Committee. The abandonment of the financial arrangements, and the sacrifice of the ninth Clause, dealing with the retention of the Irish-members, confront the House with what is practically a new Bill. Who can say how many more versions of the Deformed Transformed we shall have before July 27? As every Ministerial change of front entails fresh loss of time, it is much more likely that they will get through their Bill in August by postponing everything but the bare principle of a subordinate legislature, than that they will succeed in carrying the present revised version of the Bill by the 27th of July. However much we may wish it to be otherwise, we shall not expedite business or bring Home Rule any nearer by taking up our quarters in a fool's paradise, even if we are able to enter it by a majority of 27, made up exclusively of Irish Members.

The Queen's birthday was marked by the usual distribution of peerages, baronetcies, knighthoods, and other declarations, by which a certain number of Her Majesty's subjects are stamped, as it were, with a hall-mark of respectability and eminence. The chief features of this year's distribution of honours was the number of knighthoods and baronetcies which fell to proprietors of newspapers and editors. If the stream of journalistic declaration continues to run at this year's rate it will become the rule that no one but a knight will have a chance of securing an engagement as editor of a first-class provincial paper. As for editors of London papers, they will all be dukes

before long; that is, if they are lucky enough to be proprietors as well, otherwise they will not be able to maintain the ducal dignity. It is to be regretted that the distribution of royal favours should not be altogether free from a suspicion of jobbery and corruption. Of course Her Majesty is not to blame, and it is better no doubt that party "whips" should be able to buy their men by titles than by cash. If the story that was current in the City last month has any foundation, it would seem as if the money taint was creeping into the very fountain of honour. The rumour to which I refer emanated from a gentleman who declared that he had been approached some time since on behalf of the Liberal wire-pullers, who informed him that if he chose to be a baronet he could obtain the coveted handle to his name by the simple process of subscribing £10,000 to the party exchequer. As he did not hanker after a baronetcy, he asked how much it would cost to get a peerage, but finding that a seat in the House of Lords could only be obtained by a subscription of £100,000 to the party exchequer, he declined business. Of course the gentleman in question may have been hoaxed by an unauthorised negotiation, but it is to be feared that some at least of the birthday honours are practically granted in return for cash down. I do not mean to say that a tuft-hunter can go to Parliament Street and buy a baronetcy as you can buy a roll of bacon, but if a man spends liberally of his substance in contesting seats it is generally understood he will not go without his reward.

The Royal wedding, which will be over long before these lines meet the eye of the reader, reminds the world once more of the immense social influence that is still wielded by the Monarchy. The pity of it is that the wire-pullers of kings do not seem to realise the latent force which they are wasting. Take for instance this very wedding. All the world and his wife are preparing to turn out into the street to cheer the bridegroom and bride on their way to the altar and on their return to the palace. But why in the name of common civility should Her Majesty have decreed that in place of the stately pageant, which Royalty knows so well how to organise, and which would have enabled everybody to have seen the prince and his bride and all their royal and imperial relatives, the wedding party shall be whisked through the streets in closed carriages? They might as well go in hearses. Then again, why could the young couple not have been induced to spend their honeymoon in

Royal
Blunders.

The Birthday
Honours.

Ireland? They could have been as private as they pleased. The mere fact that the young couple had elected to begin their married life on Irish soil would have pleased every one, whether Unionist or Home Ruler. But apparently, just because it was the most obvious thing to do, it is not to be done, and Royalty once more throws away one of its trump cards.

The German Elections, which have been the leading political events of last month, go far to show that, in Germany at least, the Monarchical principle holds its own. When the Reichstag rejected the Army Bill the Kaiser appealed

The Kaiser Wins.

From Puck.]

ONLY A TOY, AFTER ALL.

[May 24, 1893.]

And what becomes of it when William pulls the string?

to the constituencies, and, much to the astonishment of many eminent authorities, secured a majority in the new Parliament. It is a narrow majority, it is true. Two hundred and five votes good for the Army Bill to one hundred and ninety-two against, and the majority in the Reichstag has been returned by a minority of the electors. But he has got a majority; and he certainly would not have got it if he kept the Monarchy shut up in a close carriage—*more Anglicano*. Count Caprivi, who was the Kaiser's election agent, had heavy odds against him. Bismarck was virtually leader of the Opposition. The ablest and most powerful popular leaders denounced the Bill. Bad trade and depressed agriculture did not dispose the electors to vote for an increase of taxation. But, notwithstanding the heavy odds against him, the Kaiser has triumphed, and the Army Bill will pass.

The New Reichstag.

The result of the Election was a surprise for the Radicals, whose followers seem to be going over *en masse* to the Social Democrats. The latter will have forty-four members in the new Reichstag. Richter, their chief Liberal opponent, who had sixty-eight followers in the old Reichstag, will only have thirty-six in the new. The Anti-Semites have now sixteen members, including the redoubtable Ahlwardt, who has been returned for more than one constituency. Dr. Virchow, one of the most respected of the retiring Radical members, failed to secure re-election. The Catholic Centre has lost its former solidity and cohesion, but it remains the strongest of all the Parliamentary groups, with ninety-six members. The feeling in Southern Germany against the Army Bill seems to have been very strong, the vote cast in Bavaria showing a majority of more than two to one against the Bill. The composition of the new Reichstag, so far as can be ascertained to-day, will be as follows:—

Conservatives, 74; Imperialists, 24; National Liberals, 50; Radical Union, 12; Radical People's Party, 24; South German People's Party, 11; Centre, 96; Guelphs, 7; Social Democrats, 44; Poles, 19; Anti-Semites, 16; Independents, 9; Danes, 1; Alsatian Protest Party, 7; Alsations in favour of the Army Bill, 3. Gains—Conservatives, 6; Imperialists, 6; National Liberals, 8; South German People's Party, 1; Social Democrats, 8; Poles, 2; Anti-Semites, 10; Independents, 3. Losses—Radical Union and Radical People's Party together, 32; Centre, 9; Guelphs, 3.

How will the French Vote?

Germany having thus decided to give the Emperor the additional soldiers which he declares to be indispensable for the safety of the Fatherland, the next question is, what will France do? The General Election in France is fixed for next month, but the second ballot will not be taken before the first week in September. Great interest attaches to this election, because it is the first to be held since the Pope ordered his Mamelukes to support the Republic. The Catholic Royalists who have rallied to the Republic constitute an element of electoral force which M. Constans is endeavouring to exploit for his own advantage. It would indeed be a cruel irony of fate if the first result of the Papal appearance as a Republican election agent were like the return to power of a politician with such a scabrous record as M. Constans. What the result of the conflict will be no one can possibly divine. No one knows how far the Panama scandals, followed by the judicial scandal of an illegal sentence—inflicted virtually by order of the Ministry upon M. Eiffel and M. Charles

de Lesseps, which the higher court quashed—have affected the French electorate. Only one thing seems clear—whatever party or politician comes to the top, French armament will be maintained.

Parties and Programmes. M. Dupuy, the Prime Minister, proclaims as his programme the policy of Republican concentration, which means, as we should say, a Liberal-Radical union, with the Liberals at the top. M. Goblet, the Radical, accepts this policy, on condition the Radicals are at the top. M. Constans, the strong man of the law and order party of the Republicans, seeks to make his game in an altogether different direction. He has his eye upon the newly rallied Royalists. He is for a concentration of the Conservative forces, a strong policy, social legislation in aid of old age pensions, and a reduction of the burdens of the peasantry. He does not propose to abandon secular education, or to exempt priests from military service, but he proclaims on other matters a policy of tolerance and conciliation. M. Constans is the Mr. Chamberlain of the situation, if we can imagine the Conservatives just beginning to rally to the cause of Birmingham; M. Dupuy is a kind of French Sir W. Harcourt of the Whig era; M. Goblet a very poor version of Mr. Morley. M. Clémenceau—"the French Parnell"—has not yet spoken.

The Penalty of Pigottism. M. Clémenceau, who was declared to have been ruined by the accusations brought against him of complicity, through M. Hertz, in the Panama scandal, has been unexpectedly resuscitated by the inconceivable folly of his enemies. M. Millevoye, a kind of French Maud Gonne, without her beauty or grace, and with about as much influence in international politics, furiously assailed M. Clémenceau in the Chamber as a traitor to France. In support of his accusation he had the incredible folly to produce in the tribune a forged document, which he alleged had been stolen from the British Embassy, showing that M. Clémenceau had been bribed with £20,000 to support British interests against the Republic. The document was so obvious a hoax that it could not have deceived even the Simple Simon of the *Times*; who so greedily swallowed the forgeries of Pigott. The only result of publication was the extinction of M. Millevoye, the prosecution of his forger, and the rehabilitation of M. Clémenceau. It is the latest illustration of the familiar doctrine that you have usually more reason to be grateful to your enemies than to your friends. Pigott in England, Ahlwardt in Germany, and Millevoye in France constitute a

remarkable trio, whose fate will, it is to be hoped, discourage for some time to come the employment of bogus revelations as a weapon in political warfare.

The Loss of the Victoria. On Thursday afternoon, June 22nd, while the Mediterranean fleet was engaged in evolutions about seven miles from the Syrian coast in the Tripoli roadstead, the *Camperdown* collided with the flagship *Victoria*, with such force that in ten minutes the *Victoria* sank, carrying down with her into seventy fathoms of water Admiral Tryon and 400 of her crew. Only about 200 were saved. This accident, which deprived the nation of one of its strongest fighting ships and one of its ablest admirals, is said to have been due to a slight delay caused by the captain of the *Camperdown* not understanding at first the signal from the flagship. Seeing from the movements of the other ships what it meant, the *Camperdown* endeavoured to take her place in line. The distance was misjudged, and the turning room was not sufficient. As both ships were under full steam, the impact of the blow from the ram of the *Camperdown* was so great as to rip up the *Victoria's* side so badly as to render it impossible to save the vessel. As the water rushed in she began to settle by the head. A desperate attempt was made to reach the shore. Only two miles of the seven were traversed by the sinking ship with her forepart almost under water, when she suddenly canted to one side, and then capsized. For a few horrible moments she floated keel up, her gigantic screws revolving in the air. After churning into bloody foam the water in which six hundred men were struggling for life, the great ironclad sank out of sight, sucking down with her into the depth, swarming with sharks, two-thirds of her company. As she sank she burst, strewing the sea for five miles with fragments of the wreck.

Admiral Tryon. The *Camperdown* was not seriously injured. Some two hundred officers and men, more or less scalded, were picked up by the boats of the other ships. Thus perished one of the stoutest of our men-of-war, which cost three-quarters of a million to build, and which cannot be replaced for at least two years. The loss in trained capacity and naval genius cannot be estimated in money. The only consolation that is left us is that in that supreme moment officers and men did their duty. Admiral Tryon refusing to leave the deck, and going down with his ship into the abyss impressed the imagination of our people with a fresh and inspiring sense of naval heroism.

DIARY FOR JUNE.

EVENTS OF THE MONTH.

- May 31. Meeting of the Council of the Women's Liberal Federation; Lady Aberdeen elected President. Discussions on Woman Suffrage, Labour, Home Rule, etc.
Annual Meeting of the English Land Restoration League.

Jose Oliveira, President of the Brazilian Commission at the World's Fair; Prof. J. Frohschammer, 72; Thomas Brett, lawyer, 51.

M. MILLEVOYE.

(The Pigottist of Paris.)

CHARACTER SKETCH: JULY.

ADMIRAL SIR GEORGE TRYON, OF H.M.S. "VICTORIA."

ONE-FOURTH of the world, being land, is divided into a considerable number of States more or less insignificant, among which some half-a-dozen great Powers stand conspicuous. The remaining three-fourths of the world, being the salt sea, is divided into several huge satrapies, over each of which reigns with supreme, although not exclusive, sovereignty the British admiral who is, for the time being, Commander-in-Chief of the Naval Station. Of these great watery dominions the most important, although almost the smallest, is the Mediterranean, and among the great potentates of the world the Commander-in-Chief of the Mediterranean station ranks among the first. This may sound hyperbolic to those who have never been at sea. Possibly enough many of our readers may be somewhat incredulous as they hear, perhaps for the first time, of authorities whose existence is not hinted at even in Mr. Arnold Forster's patriotic "Citizen Reader;" but that is because they have lived like earth-worms in their holes in the ground, and have never in all their lives

once realised that the familiar song of "Rule Britannia," however bombastic it may sound on land, is sober serious fact the moment you embark upon the sea.

It is not until you are out of sight of land that some faint, far-away conception of the might and majesty, the power and the glory of the sovereignty of the seas begins to dawn upon the mind. But as day follows day, and everywhere across the billowy expanse, from the rising of the sun even to the going down of the same, you are alone between the two infinitudes, the firmament above and the abyss of waters below, you begin to understand. And as you cross the track of the innumerable argosies

which are ceaselessly engaged in bearing the garnered wealth of the harvests of the world to the Thames and the Mersey, the Humber and the Clyde, when almost every ship you pass flies the English flag or is bound to British ports, the sense of the magnificence of our ocean

heritage imperceptibly deepens. And when, after a tour round the world, you find you visit no port that is not crowded with British shipping, that every mile of the endless circle you never passed out of the range of the authority of some British admiral, wielding an actual ever-present force, stronger than that of any rival Power, and irresistible by reason of the limitless resources of the Empire at his back, the great truth dawns upon your mind, and you begin to realise, more or less dimly, the reality of our overlordship of the sea.

Her Majesty Queen Victoria reigns on the Thames; but her sea kings both reign and rule on every ocean between the poles. Sea king is no mere phrase as applied to the Admiral Commander-in-Chief of a British naval station. His fleet is an array of floating fortresses, detached for

a time from their native land, and he himself is the living personification, the incarnate embodiment of the Empire. On all the world's broad surface no living man wields more absolute authority than the admiral on the quarter-deck, nor have Tzar and Kaiser, in all their hosts, more obedient subjects than he. He is monarch and diplomatist and warrior and judge all in one. He is the warden of the watery marches, the naval overlord of the ocean. It is he who sustains the fabric of our Colonial possessions; without him and his warships our world-circling fortresses would be as worthless as the Pyramids; it is his patrols which make the traffic on

ADMIRAL SIR GEORGE TRYON.

H.M.S. "VICTORIA" LEAVING THE TYNE, NEWLY BUILT, APRIL 6, 1888.

the trade routes from continent to continent as safe from molestation as the tramways in Hackney and Islington. And this puissant sovereignty, built up by the valour and the labour and the lives of successive generations of British seamen, is maintained to this day by the same means, and exercised as of old in the ever present menace of Death. Our fathers wrested the trident from the hands of the Sea-god because they did not fear to die, and we wield it to-day as of yore on the same terms, in defiance of the anger of the storm, of incalculable mischances of accidents, and of the carnage of battle.

But the enemy, though vanquished, is no submissive vassal bending low before the prows of the conquering ships. Ever and anon he seizes or makes opportunity to wreak a shrewd revenge upon the dominant Viking. Sometimes a great storm arises, and the abyss swallows ship and captain and crew, who go down a living sacrifice into the depths. But oftener, when the waves are still and danger seems afar, destruction swoops down upon the victor, and a collision or an accident sinks the flagship of the admiral like a broken potsherd to the bottom. Such things are the incidents, always recurring, of the sovereignty of the seas. It is upon such conditions of tenure that the sea tolerates our dominion. So it has been in the past, so it will be in the future, and so, as the fate of the *Victoria* and its admiral and crew reminds us, it is to-day. But Britannia, while sorrowing for her sons who went out but return no more for ever, sheds no unworthy tears and makes no fretful moan. She only asks if they bore themselves worthily at the supreme moment, and, when satisfied on that point, replaces with pride the missing ship, and sends forth without a phrase, save of gratitude and exultation, another crew not less brave and disciplined to keep flying at the peak the "flag that braved a thousand years the battle and the breeze." Our sailors have looked too long in the face of death in all its shapes for even the loss of the *Victoria* and her gallant crew to occasion a momentary dismay. Yet the catastrophe which cost us one of our ablest captains and one of our most powerful fighting ships was tragic enough to make the sound of mourning audible throughout the land. When Admiral Tryon went down with his ship, a great man and a ruler in our naval Israel perished in his prime. Nor can the mere loss of life be regarded as inconsiderable. More lives were lost when the *Victoria* was rammed by the *Camperdown* than the *Victoria* lost in killed and wounded at the Battle of Trafalgar. And, besides the Admiral and his crew, there is the ship. It is the fashion among some writers to decry the modern ironclad, as if it were a mere clumsy ugly box of machinery and boilers, a thing from which all sentiment and romance had departed. A man can love the trim *Galatea* or the saucy *Arethusa*. The sailing ship, with her great expanse of canvas, her graceful lines, has an individuality of her own; she walks the waters as a thing of life, and her crew, from the captain down to the powder-monkey, may well feel towards her as a lover towards his mistress. But an ironclad—pshaw! one might as well wax romantic over the rule-of-three or vulgar fractions. So sneer the land-lubbers who have never seen an ironclad except from the shore. As a matter of fact, these great marine monsters do succeed in inspiring the same kind of sentiment in the men who sail them and who fight them as did the old wooden battle-ships. The *Victoria*, like all her consorts, perhaps even more than most, had a character all her own. From the time she was launched at

Elswick down to the day when she capsized off the Syrian coast, she has been one of the most distinctive and remarkable characters among the fighting fleet of Britain. Notwithstanding the ill-luck that seafaring men believe clings to any vessel that has been twice named—she was first christened the *Renown*, *Victoria* being an afterthought—the Tyne-built ironclad was always popular in the navy. Her commander loved her. Her crew were proud of her. She was one of the crack ships of the service, and when the news came of her untimely destruction, there were not a few who felt a more poignant sense of personal bereavement in the loss of the ship than even in the fate of her admiral and crew. Even among landmen the *Victoria* was a familiar friend. Every one who visited the Naval Exhibition wondered at her gigantic turret with its tremendous gun, and shuddered at the graphic representation of the penetrating power of the 110 tonner which was painted on the adjoining wall. The silver model of the vessel that was presented to Her Majesty and the wonderfully executed wooden model shown by Lord Armstrong were among the special attractions of the Exhibition. Hence the shock occasioned by her destruction was greater than would have resulted from the sinking of any two of her consorts.

Notwithstanding all this—notwithstanding the sense of loss and the consciousness of the sudden impairing of our fighting strength on our most exposed station, the sinking of the *Victoria* is already coming to be regarded with a feeling rather of pride than of chagrin, of gratitude and exultation than of melancholy. It was a misfortune, no doubt, but it was one of those disasters which ennoble more than they injure. So far as can be seen at present, with the exception of the one irreparable mistake, nothing went wrong—nothing was done that ought not to have been done; everything was tested under the breaking strain of imminent death, and everything and every one was found to be perfect and entire, wanting nothing. Even in the suddenness and completeness of the catastrophe we have a certain consolation. We have at least demonstrated now beyond all gainsaying how irresistible a weapon is the ram of the *Camperdown*. Of all the ironclads afloat there was none stronger, although there were one or two larger than the *Victoria*. But at the first blow from the ram of her consort, a blow dealt by mischance, and without the calculated force and fury of war, the *Victoria* was crushed into irremediable ruin. No one after this can question the effective fighting value of the ram. Now Great Britain has many rams at her disposal, many more rams than we had *Victorias*, and the loss of the *Victoria* has heightened the face value of all the rams that to-day are flying the white ensign.

At first, no doubt, there was a disposition to exaggerate the significance of the evidence thus afforded as to the fragility of the modern ironclad. But, on second thoughts, this was seen to be unjust. There is nothing exceptional or unusual about the capsizing of an ironclad. British men-of-war of the most ancient heart-of-oak pattern keeled over as suddenly as the *Victoria* with even less excuse. Mr. Froude, in *Longman's Magazine*, reminds us this very month how that, at the very beginning of our naval wars, when the British fleet were repelling a French attack, insolently delivered at the very gates of Portsmouth, one of our first fighting ships keeled over and sank, drowning all her crew. The loss of the *Mary Rose* under the eyes of Henry the Eighth at Spithend, while the enemy was actually engaged in an attempt to destroy our navy and land on our shores,

was a far greater disaster than the loss of the *Victoria*. The story of the sinking of the *Mary Rose* told by Sir Peter Carewe, who witnessed it, may be recalled opportunely just now to remind us that as there were brave men before Agamemnon, so England had first-class fighting ships that could turn bottom up before the *Victoria*, and even before the *Royal George* :—

The Kynge hearing that the French galleys rowed up and doune in the very haven of Portsmouth fretted, and his teethe stooode one and edge to see the braverye of his enemyes to come so neere his noose and be not able to encountre with thyme. . . It was the Kynge's pleasure to appoint Sir George Carewe to be Vice Admyrall and haile appoynted unto hym a shippe named the *Marye Rose*, which was as fyne a shippe, as stronge and as well-appoynted, as none better on the realme. . . The Kynge then toke his boats and rowed to the lande. . . The sayles were no sooner hoysted but that the *Marye Rose* boganne to heele, that is to leane, on the one side. Sir George Carewe being then in his own shippe and seeinge the same called for the master of his shippe, and told him thereof and asked hym what it mento? Who answered that yf she did heele she was lycke to be cast awaye. Then the sayd Sir Gawen passage by the *Marye Rose* called one to Sir George Carewe asking hym how he did? Who answered that he had a sort of naves whom he could not rule. And it was not longe after but that the sayde *Marye Rose*, thus heeling more and more, was drowned with 700 men.

Mr. Froude says that "the ports of the ship were open for action, her guns were run out, but, misled by the calm that prevailed, the crew had insufficiently secured them; the wind came up with a sudden sweep, and as the *Mary Rose* was slightly heeled on one side, her hindmost tier of guns broke loose, rolled across the deck, and with their weight and momentum it depressed the leeward side so that the water rushed in at the open ports, filled the ship, and sunk her with nearly every soul on board." In the very place where the *Mary Rose* capsized in the sixteenth century, the *Royal George* heeled over in the eighteenth. Both these vessels, like the *Victoria*, were ranked among the best of their time. Of the *Mary Rose*, Sir Robert Howard, who commanded her in 1513, told King Hal she was "the noblest shipp at this time that, I trow, be in Christendom, the flower of all shippes that ever sayled." But this peerless vessel turned turtle and carried down to the bottom twice as many as those who went down in the *Victoria*.

It is well to remember that, with the exception of the *Captain*, there had been no great loss of human life in connection with any of our ironclads until the ramming of the *Victoria*.

It must also be borne in mind that, although the *Victoria* went down rapidly before the stroke of the *Camperdown's* ram, she had proved her exceeding toughness and stability only the previous year, when, after grounding on a rock off the coast of Greece, she was got off without serious injury. If she was not like the *Mary Rose*, "the flower of all shippes that ever sayled," she was, all things considered, one of the most perfect specimens of the modern warship that ever carried an admiral's flag. Landsmen can only give with more or less precision the facts about her dimensions and her armament, but those who knew her and had many a time sailed in her—faced the storm in her, and hoped for nothing better than to have an opportunity of showing her prowess in the van of battle—mourn for her with a personal sorrow as if some dear friend or mistress had disappeared from the world. Her great guns will no more awake the echoes of fortress wall or seagirt cliff with their thunder. In vain was she sheathed in massive armour seventeen inches in thickness and

filled with watertight compartments like a honeycomb. She has perished without ever having tasted the fierce joy of battle, or of having given or received either shot or shell. And yet, perhaps, who knows but that even in her last death-plunge she may have done more for England and England's fleet than if, like the *Victory*, she had sailed the seas for forty years and carried Nelson's pennant at Trafalgar.

For the name of the *Victoria* will ever be associated with a story that the nation will cherish as one of those precious records by which Empires live. It was all over in fifteen minutes, but that fifteen minutes will live in history as lives the Balaclava charge, which did not last much longer. The testing times of life seldom last long. The first dip of the litmus paper in the solution proves the existence of acid, and the first moment of a supreme crisis suffices for a test. And as it has been said that it was almost worth the enormous expenditure of the Crimean War to have the object lesson which was afforded by the charge of the Six Hundred—of the absolute readiness of the British soldier to ride "into the jaws of death, into the mouth of hell"—so it may be said that it was almost worth while to lose the *Victoria* in order to have so superb an illustration of the mettle of our men. Death, in the old phrase, is the gate of life, but Death is more than that: Death is the sovereign alchemist who assays the value of the coin struck in the mint of life. Death is the supreme test. Invincible in life, are our blue-jackets invincible also in death? Their drill goes like clockwork by day and by night; their discipline is perfect by sea and by land. But how will it be when each individual, nay, when the whole ship's company with all its component weaknesses and shortcomings, is suddenly slung over an abyss yawning eighty fathoms deep below, with not one chance in three that any will escape alive? The *Victoria* supplied an answer. Not for a single moment does there seem to have been even a faltering word or a flurried deed.

Not even when the great ship reeled and quivered like a wounded thing beneath the crushing blow of 10,000 tons of metal hurled against it at the rate of eighteen miles an hour, did any of the crew or the officers lose their self-possession. Everything which had been laid down and provided for such an emergency was remembered and acted upon. Whether in trying to get out the collision mats, or in the last desperate plunge shoreward, in which the half-sinking ship, with her forepart all under water, steamed towards the land—everything seems to have been done with the regularity and steadiness and cool courage that are the distinguishing features of the British navy. And in the last dread moment when the order was given "Each for himself," which dissolved the organic whole of the disciplined ship's company into a mass of individuals each set free to seek his own safety in his own way, nothing seems to have been done unworthy the name and the fame of the British sailor. The papers, indeed, are full of stories of the self-forgetting devotion of these blue-jackets to each other.

All seem to have been alike, from the admiral who sank with his ship to the chaplain who perished in saving others. The midshipman who refused to leave the admiral and went down by his side. The brave fellow who freed the diver from his lead-laden sinkers, and lost his own life while so doing although he saved the diver's—and all the other incidents of heroic selflessness and a comradeship that is stronger than death—these things are a priceless addition to the heritage

of our land. These men have not died for naught or in vain. They have died that we might live, as much as if they had fallen beneath the canopy of the battle smoke, amid the roar of the broadside. There, off the Tripoli roadstead, as much as at Trafalgar, did England help us; how can we help England say? Such things are to nations as the bread of life. They remind us of the saving virtue of obedience and of discipline, and they inspire the breast of the people with an ideal of duty and of self-sacrifice which ennobles and glorifies the every-day life of the ordinary man. For they were not picked souls, the three hundred that perished off Tripoli, as were the three hundred of Thermopylae. They were taken at random out of the rank and file and put into the crucible. By such experimental tests in the laboratory of life history is able to form its estimate of a race. So long as the chance samples of our common folk can die as did the men of the *Victoria*, there is not much fear but that the empire will live.

Ordinary English folk they were in the engine-room and in the stoke-hole as well as upon the quarter-deck. For the admiral, whose name is on every lip, was a fair type of the naval officer who comes of a good old English stock, passes through the usual training of our service and arrives in due time at the summit of his profession. Sir George Tryon was intensely human. The instinct of self-preservation was strong in him, and from his youth he had ever a keen eye for every step that led aloft. He pushed his way from the midshipman's hammock to the admiral's cabin, nor did he ever forget himself along every step of that long road which led him from the trenches of Sebastopol to the command of the Mediterranean fleet. The story of his career is a fair sample of that of the successful naval officer. Born sixty-one years ago, Admiral Tryon kept unimpaired to his death that wonderful stock of native energy and supreme personal vitality which constitute the most obvious secret of his success in life. The second son of a Northampton country gentleman, he was born into an old Tory atmosphere which agreed with him. His father was Chairman of the Conservative Association of North Northampton, and one of the episodes in the son's varied career was a candidature in the Conservative interest for Spalding in 1887, which issued disastrously for his party. The father Tryon was all of the olden school; a man to whom poaching was as the sin against the Holy Ghost; who stood up for the Church and the Crown; a law and order man, with but scant sympathies with modern tendencies; a man, in short, who ruled in the squirearchy as his son and his brother, Admiral Robert Tryon—for Sir George is not the only admiral in the family—ruled on the quarter-deck.

To some extent the father's influence was modified by the more refined and cultured spirit of his mother, from whom he is said to have inherited many of his best qualities. George was a younger son, and as it was necessary he should do something for himself, he followed his uncle's example and entered the navy. He became a middy when sixteen, and six years later, when the Crimean War broke out, he found himself as mate in the Naval Brigade before Sebastopol. In the trenches he received his first and only wound, for the Crimean campaign was his sole experience of actual war. When Sebastopol was taken, Tryon was lieutenant with a couple of medals and the clasps of Inkermann and Sebastopol. For the next twelve years he fought his way steadily upward, serving a turn on the Royal yacht, and afterwards gaining his first experience of an iron-

clad as commander of the *Warrior*. For thirteen years therefore he had served in the old line-of-battle ships, and after three years on board the *Warrior* he went back to the older ships, commanding (1864-6) a small gun-vessel of four guns on the Mediterranean station, and afterwards going as additional captain for transport service to the *Octavia* (35) on the East India station.

It was in connection with this appointment that he found his first opportunity for distinguishing himself. The Abyssinian Expedition in 1868 necessitating the transport of an immense quantity of stores and material of war to Lord Napier's base on the coast, Captain Tryon was appointed as Director of Transport. The Admiralty could not have made a better choice. Captain Tryon, full of energy, indefatigable, sparing neither himself nor others, with the personal appearance of one born to command, and a determination that, whether he was born to it or not, he was going to do it, and that he would stand no nonsense, was the very man for the post. He made his mark, obtained his C. B., was specially mentioned in the dispatches, and received the Abyssinian medal. Annesley Bay was his jumping-off place. From that moment he never looked behind him.

Captain Tryon obtained his first commission behind the scenes in 1871, when he became private secretary to Mr. Goschen, who was First Lord of the Admiralty. With Mr. Goschen he remained till Mr. Gladstone was turned out in 1874. Mr. Goschen has been fortunate in his private secretaries, for Mr. Milner was as remarkable in his way as Captain Tryon was in naval affairs. After being for three years the mouthpiece, factotum, and sometimes, perhaps, the wirepuller of Mr. Goschen, he returned to active service as captain of the *Raleigh* in 1874.

From 1874 onward, Captain Tryon was afloat, serving either in the detached squadron or in the Mediterranean. His first notable command was the *Monarch*, which he joined in 1878. In this vessel in 1880-1 it was his good fortune to act more as a British plenipotentiary in Tunisian waters than as a mere captain of a ship in the Mediterranean fleet. The French were then engaged in occupying Tunis, to compensate themselves for the occupation of Cyprus. Captain Tryon was told off to keep a look out on their doings. This he did with great adroitness and diplomatic address. He never offended the French, but they never got the better of him, and when, in 1881, he served as one of the Commissioners who had to inquire into the Sfax bombardment claims, he acquitted himself to universal satisfaction. In 1879 he became naval aide-de-camp to the Queen, a post which he delighted in, for, true to his hereditary tendencies, Tryon was ever a courtier, to whom decorations are realities worth thinking about, and royal favour as the sunshine from on high.

After he paid off the *Monarch* Captain Tryon once more returned to the penetralia of the Admiralty administration, and for three or four years acted as Permanent Secretary to the Board. It was during the latter end of that period that I first met him, during the agitation which the *Pall Mall Gazette* carried to a successful issue for the strengthening of the navy. He struck me at the time as a man of great natural force, with a very strongly-developed instinct of self-preservation and a much clearer perception of the importance of the special work in which he was immediately engaged than of the bearing of that particular department upon the navy as a whole. For so able a man he seemed singularly inarticulate, although he may purposely have adopted that method of conversation in order to conceal his thought. That could hardly

have been the case when he was discoursing upon the one topic on which he was at that time most interested—the necessity for increasing the number of stokers. He repeated himself over and over again, read passages from his report, harked back to it and fumbled around it until I confess I got rather wearied. He was quite right in what he said, no doubt—as right as that two and two make four; but an iterated and reiterated demonstration of the fact that two and two make four is apt to pall upon you. He was a man of ideas which manœuvred at short range round the centre, but possibly enough this very concentration was one of the elements of his influence in the service. As with Mr. Gladstone, when once he had made an idea his own, it acquired an altogether new and almost transcendental importance by the mere fact of such adoption.

Mr. Gladstone, it is often said in the navy, would have made a splendid admiral of the old school. Admiral Tryon was something of the kind of admiral that Mr. Gladstone would have been, minus Mr. Gladstone's marvellous capacity for lucid expression, a gift which is thrown into relief by his still more marvellous gift of concealing his meaning when it does not suit him to speak plainly. There was in the two men a great driving force, a powerful, all-pervading personality that was the great secret of their power. The Admiral, like the Prime Minister, in his naval manœuvres was bold, dexterous, subtle, and *rusé*. The old Parliamentary hand of St. Stephen's would have found his peer in the tall Admiral if they had been pitted against each other in some arena where each could do his best. Both had achieved so many successes by bold and dexterous manœuvring, that both at length were their own undoing, and there are others besides Unionists may see a fatal analogy between the attempt to turn round in a space too narrow off the roadstead of Tripoli, and Mr. Gladstone's "steam tactics" in dealing with Home Rule.

After Tryon left the Admiralty, he was appointed to the command of the Australian station, over the heads of twenty senior rear-admirals. There was some growling that found expression in the columns of the *World*, where "Atlas" maintained that his sudden lift was due to nepotism and jobbery at the Admiralty. As a matter of fact, the Admiralty wanted to see what could be done in the way of concerted naval action with the colonies, and they sent out their ex-Permanent Secretary to see what could be done. They chose wisely, and the action that was subsequently taken by the Australian colonies was largely due to the diplomacy, the personality, and the driving force of Admiral Tryon.

On his return from Australia in 1887, he received his K.C.B., and for the next three years he was regarded at Whitehall as a kind of champion admiral, whom they utilised by giving command of one or other of the fleets in the Naval Manœuvres for three successive years. In 1888, a year after he had tried to enter Parliament and failed, he was appointed Admiral Superintendent of the Naval Reserves, and here he found an ample field for his exuberant energy. He was not a good worker, but he loved to wield the pen. He experienced a genuine delight in "making things hum," to quote an expressive American idiom. He drew up a report on the Naval Reserves which is still the chief authority upon the subject, he reorganised the system of coast signals, and generally did what a capable, pushing, hardworking seaman ashore could do to improve the administration of our fleets.

His tall commanding figure was very familiar during these years in Whitehall, Spring Gardens, and Pall Mall.

"A tall, big-built man," said an Australian interviewer, "is Admiral Tryon, with close-cut beard and moustache—a typical lord of the sea." A great smoker and a man who loved to hear himself talk, he was a personage and an authority who loomed almost as big in society as he did in person.

In 1891 he became the Commander-in-Chief of the Mediterranean fleet, hoisting his flag on the *Victoria* in September in succession to Admiral Hoskins, the present first Sea Lord. There he remained, never quitting his ship, not even when the *Camperdown* sent her to the bottom.

Writing on July 1, before the despatch of Admiral Markham had reached this country, it is somewhat dangerous to attempt to describe the disaster which terminated so suddenly so promising a career.

The story of the manner in which Admiral Tryon prepared and carried out the operations necessary for the rescue of the *Victoria* when she had run aground on the shelving rocky shores of Greece constitute a romance in the annals of the sea; but to that I cannot do more than allude in passing. It sufficeth to say that no man, during his command in the Mediterranean, left a deeper and more abiding sense of a masterful, resourceful personality—a man capable of foreseeing all things and preparing for all things.

One in whose judgment I would place more respect than that of any other person employed in the navy, told me that after long and close observation of Admiral Tryon, both in command of fleets and in naval manœuvres, and on his flagship in the Mediterranean, he had come to the absolute conviction that if ever we had been plunged into naval war, Admiral Tryon was not only the best man, but was absolutely without a rival as commander-in-chief of the naval forces of Great Britain. Few men really knew how much he had meditated, how carefully he had prepared for almost every contingency which could arise in case of the outbreak of war. Commanding the confidence of his officers and the respect and admiration of his men, he was almost an ideal commander, and as our sea-king in the Mediterranean he occupied a position for which he was pre-eminently well qualified.

And now, in face of all this, and much more that was known among those who have cruised with him and lived with him in storm and calm during the forty years and more that he served under the flag—in face of all this comes the disastrous tidings from the Levant, from which it would appear that we have lost our finest fighting admiral and one of our finest warships through a miscalculation as to distance of which a young lieutenant could hardly have been guilty. It seems incredible; nor can we wonder—even in face of the detailed telegrams from the officers who survived the collision—that many of those who have known him best find it utterly impossible to believe that he could have issued the order which brought about the disaster.

As the story stands to-day—and I am at a great disadvantage in writing before any official dispatch has been published—it would seem that the fleet, or the greater part of it, was performing some evolutions off the coast of Tripoli. The ships were in two columns—the *Victoria*, Admiral Tryon, leading the port column, while Admiral Markham, on the *Camperdown*, headed the star-board column. After several evolutions had been gone through, including, it would seem from the statement of the captain of the *Barham*, the movement known as the "gridiron," by which the columns changed their places, Admiral Tryon signalled to the ships to "alter their

course sixteen points," so as to turn round and reverse their course within the lines of the column. It is not yet known how many vessels were in line. It is assumed at the Admiralty that there were twelve ships in all—that is, six in each line. If so, the space between the columns should have been 2,400 yards. As a matter of fact, it was only 1,200. Even if it had been 2,400 it would have been very risky to have turned inside the columns, while the whole wide sea was available for them to turn round outside. As each ship had only 600 yards in which to turn, the danger of executing the order was recognised, it is said, both on board the *Camperdown* and

REAR-ADMIRAL MARKHAM.

(From a photograph by R. Ellis, Malta.)

by Admiral Tryon's own officers. The *Camperdown* hesitated, and Admiral Tryon's Staff-Commander pointed out that there was no room to execute the manoeuvre. Admiral Tryon, it seems, persisted that the evolution should be attempted; an impatient message was signalled to the *Camperdown*, and the turning movement began.

In two minutes the two huge vessels, each weighing over 10,000 tons, and driven by engines of 14,000 horsepower, crashed into each other. The *Camperdown* struck the *Victoria* just before the turret and penetrated six feet into the soft underside of the ironclad, ripping up the plates, and letting an immense volume of water into one side of the ship. For two awful minutes the vessels were interlocked, but the *Camperdown*, which was almost uninjured, then succeeded in withdrawing her ram from the injured side of the *Victoria*. But the sudden flooding of one side of the ship with some

hundreds of tons of water caused a list and a settlement at the head, which soon showed that the ship was in imminent danger.

Admiral Tryon, however, notwithstanding the tremendous shock with which the vessels had collided, could not believe that the flag-ship was in serious danger. He even forbade the lowering of boats by the other ships who realised the situation and were preparing for the worst. The conduct of the crew appears to have been ideal. When the vessel struck, a silence so profound reigned that every word uttered by the captain could be heard by all on deck. Every order given was promptly executed, the men going to their quarters as if they were doing ordinary drill, and every effort being made to adjust the collision mats. Unfortunately the wound was too serious, and it is probable that the water was now pouring in at the opened port-holes. Orders were given to drive full steam ahead for the shore, in the hope of being able to beach the vessel. She had not proceeded a mile when it was evident that all was lost. Captain Bourke gave the order for everyone to save himself who could, and every effort was made to bring up the sick and others from below, while those who could, flung themselves into the sea. But the majority were still on board when the ship suddenly heeled over, her masts striking the water with great force, and the ship remained floating bottom uppermost for three minutes.

Then a strange thing was seen. The engines, which had been going at full speed, were kept going although the furnace fires were on the top of the boilers instead of below, and the double screws, released from the water, were racing through the air at a fearful speed. As the ship slowly sunk below the water the screws dashed up clouds of foam, in the midst of which, it is feared, some poor struggling mortals were cut to pieces. Then, at last, with a gurgling sound, the great ironclad sank to the bottom, her decks bursting as she plunged below. The boats of the *Camperdown* were busily picking up the remnant of the crew, but the majority will be seen no more until the sea gives up its dead.

As for Admiral Tryon, who realised too late the catastrophe which his miscalculation had brought upon his country and his crew—the last that was seen of him was that he was standing upon the bridge, steadying himself with one hand on the rail, while with the other he covered his eyes, as if to shut out the scene of horror and of death which spread around him. Then the ship heeled over, and Admiral Tryon was seen no more. Such was the end of a great career—an end not lacking in dignity and in tragic awe. There is something intensely pathetic in the thought of this great captain and sea-lord going down to his doom, shattering into irremediable ruin his great career, and at last paying the penalty with his own life for his own mistake.

I cannot do better than conclude this article by quoting a letter which Lord Charles Beresford has just written to me, in reply to a letter I had sent him on the subject:—

I have only just received your letter. I should have been glad to have added my voice to the universal praise given to poor Sir George Tryon. The country will never know what it has lost by his death. Amongst brilliant leaders, he was exceptional. He commanded absolute faith, unsparing devotion, and the most kindly affection. He forgot nothing, his thoughts were as kindly and as sympathetic for the boys under his command as they were for his officers. I cannot think of his loss without the most intense emotion.

LEADING ARTICLES IN THE REVIEWS.

THE REUNION OF BRITAIN AND AMERICA.

A LOOK AHEAD. BY MR. ANDREW CARNEGIE.

It is now just ten years ago since Mr. Russell Lowell wrote to me in reply to an article I published in the *Pall Mall Gazette*, which advocated the reunion of the British Empire and the American Republic, saying that it was a beautiful dream, but none the worse on that account, as most of the good things that exist in the world began by being dreams. Since then events have marched somewhat rapidly, and here we have in the *North American Review* for June, a paper by Mr. Andrew Carnegie, who is one of the most practical of hard-headed men, declaring that the time is ripe for realising that dream. Mr. Carnegie's paper is very remarkable, and deserves even more attention than it has already received. It is the last chapter of his new edition of "Triumphant Democracy," and from many points of view it is more significant than anything that the rest of the work contains. Mr. Carnegie believes, and sets forth with due detail the reasons for the faith that is in him, that the great crime of George III. can be undone, and the English-speaking race all round the world can be once more brought into organic political union.

MR. CARNEGIE'S PROPHECY.

That events are tending in this direction no one will very much doubt who has taken the trouble to note the significance of the right-about-face of Mr. Gladstone on the subject of the International Treaties of Arbitration of the United States, to say nothing of other indications to be found in the old country and in the Dominion of Canada. Mr. Carnegie told me that when he sat down to his desk to write "A Look Ahead," he was inclined to believe that the scheme was somewhat visionary; but when he sent his manuscript to the press, he had come to the conclusion there was nothing more practical or more important pressing upon the attention of statesmen. Mr. Carnegie concludes his paper by declaring—

Let men say what they will, therefore, I say that as surely as the sun in the heavens once shone upon Britain and America united, so surely is it one morning to rise, shine upon, and greet again "The Re-united States," "The British American Union."

That may be the case, although the British American Union is rather a long title.

A SUGGESTION BY THE WAY.

But Mr. Carnegie is not merely prepared to predict the reunion of Britain and America, he is ready with a suggestion, which can hardly be called practical, as to the first step which should be taken to give effect to his scheme:—

There is sitting at this moment in Paris a conference composed of delegates from London, Ottawa and Washington, charged by the three branches of our race to obtain a satisfactory basis for the preservation of the seals in Behring Sea. After their task has been concluded the same distinguished men, each among the foremost citizens of the respective branches, could meet in London and suggest a basis for restoring the union which only a century ago so happily existed between Britain, Canada and America, and made them one nation. It would be so easy a task that its very simplicity amazes and renders us incredulous.

WHY REUNION IS POSSIBLE.

Passing by this proposal, which, however, can hardly be regarded as serious, we now come to Mr. Carnegie's

statement of the reasons which led him to believe that reunion has come within the scope of practical politics:—

Both Briton and American being now fully agreed that those who made the attempt to tax without giving the right of representation were wrong, and that in resisting this the colonists vindicated their rights as British citizens, and therefore only did their duty, the question arises—Is a separation thus forced upon one of the parties, and now thus deeply regretted by the other, to be permanent?

I cannot think so, and I crave permission to adduce some considerations in support of my belief that the future is certain to see a reunion of the separated parts, and once again a common citizenship.

A feeling of confidence in each other among the respective communities of the race in Great Britain and America may be expected to grow, as political institutions continue to assimilate.

It is to be noted that only in the region of political ideas is there dissimilarity, for no rupture whatever between the parts has ever taken place in language, literature, religion, or law. In these uniformity has always existed; although separated politically, the unity of the parts has never been disturbed in these strong cohesive and cementing links. The books and periodicals read upon both sides of the Atlantic are rapidly becoming the same. The decision of one court is good law in all. Language remains uniform, every approved change in one part of the great realm rapidly being adopted throughout the English-speaking world. Religious ideas are the common property of the race. There seems nothing, therefore, to keep the sections of the race apart, but everything to re-unite them.

FREE TRADE WITH AMERICA.

Mr. Carnegie, I am glad to say, has grasped the fundamental principle which Mr. Gladstone has so often shown his inability to apprehend, that the sea unites instead of divides. The ocean now furnishes the cheapest of all modes of communication between men. The telegraph also renders political reunion possible, not to say inevitable. If England and America were one they would be able to maintain the peace of the world and bring about the disarmament of Europe. In addition to those advantages, Mr. Carnegie points out that the Anglo-American Union would open the American market to British goods. He says:—

An Anglo-American reunion brings free entry here of all British products as a matter of course. The richest market in the world is opened to Britain free of all duty by a stroke of the pen. No tax can be laid upon products of any part of the Union even for revenue, although under "free trade" such taxes might still exist. The ocean, which many are still apt to consider a barrier between the two countries, is the very agency which brings them so close and will ultimately bind them together. Coal, iron, steel, and all kinds of merchandise from Britain reach American ports more cheaply than American manufactures produced within a hundred miles of these ports.

I do not hesitate to say that reunion would bring with it such demand for British products as would tax the present capacity of Britain to the utmost, for the products of Continental nations, which now compete so seriously with Britain, would be almost excluded even by a tariff strictly for revenue. There would not be an idle mine, furnace or factory in the land.

In addition to those solid reasons, Mr. Carnegie lays great stress upon the extent to which the mind of the individual citizen expands in response to the magnitude of the state to which he belongs; dealing with great affairs broadens and elevates the character.

THEY MUST INCREASE; WE MUST DECREASE.

This may all be true, many will say; but what chance is there for America on one side, and the British on the

other, to see things from Mr. Carnegie's standpoint? Mr. Carnegie is sanguine that the British will not hang back, because:—

The only course for Britain seems to be reunion with her giant child, or sure decline to a secondary place, and then to comparative insignificance in the future annals of the English-speaking race. What great difference would it make to Wales, Ireland and Scotland if their representatives to the Supreme Council should proceed to Washington instead of to London? Yet this is all the change that would be required, and for this they would have insured to them all the rights of independence.

This is not a very pleasant prophecy for the Britisher, but it is based upon the solid evidence of statistics which Mr. Carnegie parades with justifiable pride.

ARE WE READY FOR UNION?

In America he thinks the scheme would be popular on other grounds:—

The reunion idea would be hailed with enthusiasm. No idea yet promulgated since the formation of the Union would create such unalloyed satisfaction. It would sweep the country. No party would oppose, each would try to excel the other in approval.

From a review of the present position of the question we find that even to-day we can say Canada, the United States and Ireland are ready for reunion; that Scotland presents no great difficulty; neither does Wales, and both have everything to gain and nothing to lose by reunion; and that the causes of continued disunion which admittedly exist in England are rapidly vanishing and are all melting away like snow in the sunshine; the colonial empire, the Indian question, European entanglements present no insuperable obstacle, and hereditary privilege and a national church are doomed. The present generation is to find several of these obstructions abolished; the succeeding generation probably is to find no trace of any of them.

OBSTACLES IN ENGLAND.

Mr. Carnegie then considers the obstacles to the reunion in the political institutions of the old country. For it is needless to say that the political organisation of the Re-united States will be republican and democratic. In order to constitute Britain an eligible member for this great Federation, Mr. Carnegie thinks we must get rid of such little trifles as the Monarchy, the Peerage, the Established Church, and the Indian Empire; but therein Mr. Carnegie makes his mistake; it is perfectly possible to have a union between Britain and America which would enable us to cultivate those institutions as a harmless little peculiarity of our own. Mr. Carnegie, however, thinks otherwise, and he has even worked himself up to a belief that the Prince of Wales may lead the way in bridging over the gulf created by George III. in the last century.

AN INVITATION TO HER MAJESTY.

Mr. Carnegie says:—

From what wise friends who know the Prince tell me, I am persuaded that he is the last man in the world to stand in the way of healing a separation which he so constantly deploras, and unless the estimate formed by all, of the patriotism, virtues and character of Her Majesty herself be strangely awry, she would give up much beyond her Crown to be the peacemaker who brought reunion to her race. Strange almost beyond explanation is the fact that this woman, from one point of view bereft of political power, a mere instrument in the hands of her elected ministers, nevertheless is in this omnipotent. She is the only one who could by a sublime act reunite the separated branches of her race. Never in the history of the world has it been in the power of any human being to perform so great an act, or to secure so commanding a place among "the immortal few who were not born to die." All the saints in the calendar would give place to Saint Victoria were Providence to favour her by calling her to perform a mission so fraught with blessing to her

people and to the world. There would be but two names set apart for ever in the annals of the English-speaking race—names far beyond all other names than any name now known to man is beyond that of all his fellows—Victoria and Washington—patron saints of our race; he, the conqueror, who, manlike, drew the sword in righteous quarrel; she, womanlike, the angel of peace and reconciliation; each adding lustre to the other, and equal in power and glory.

For such a mission and such a destiny even Queen Victoria on bended knee might pray.

In England, Ireland, Scotland and Wales a proposition to make all officials elective by the people after Victoria passes away, which God grant must be long is the prayer of every American, would command a heavy vote.

This may be, or may not be, we are all free to disbelieve a prophet, and Mr. Carnegie in this matter is walking by faith and not by sight. Still, apart from the suggestion that we should get rid of our peculiar institutions in order to qualify for admission to the Re-united States, the article is one which will deserve the very careful consideration of the English-speaking race in all its ocean-sundered branches.

THE LIMITATION OF THE AMERICAN FAMILY.

THE DECLINE IN THE BIRTH-RATE.

In the *Forum* for June, Dr. J. S. Billings, writing on the diminishing birth-rate in the United States, calls attention to a fact which is not often referred to, namely, that the birth-rate is declining in all civilised lands, and even more in the United States than other countries:—

In the United States, the proportions per 1000 for 1880 and 1890 were respectively 36.0 and 30.7; England and Wales, 34.2 and 30.2; Scotland, 33.6 and 30.3; Ireland, 24.7 and 22.3; France, 24.5 and 21.8; Belgium, 31.1 and 28.7; German Empire, 37.6 and 35.7; Austria, 38.0 and 36.7; Switzerland, 29.6 and 26.6; Denmark, 31.8 and 30.6; Norway, 30.7 and 30.0; Netherlands, 35.5 and 32.9.

Dr. Billings discusses the question as to the cause of this remarkable decrease, and the following is his conclusion:—

The most important factor in the change is the deliberate and voluntary avoidance or prevention of child-bearing on the part of a steadily increasing number of married people, who not only prefer to have but few children, but who know how to obtain their wish. The reasons for this are numerous, but I will mention only three.

The first is the diffusion of information with regard to the subject of generation by means of popular and school treatises on physiology and hygiene, which diffusion began between thirty and forty years ago. Girls of twenty years of age at the present day know much more about anatomy and physiology than did their grandmothers at the same age, and the married women are much better informed as to the means by which the number of children may be limited than were those of thirty years ago. To some extent this may also be true as regards the young men, but I do not think this is an important factor.

The second cause has been the growth of the opinion that the abstaining from having children on the part of a married couple is not only not in itself sinful, or contrary to the usual forms of religious creeds, but that it may even be under certain circumstances commendable.

The third cause is the great increase in the use of things which were formerly considered as luxuries, but which now have become almost necessities. The greater temptations to expenditure for the purpose of securing or maintaining social position, and the correspondingly greater cost of family life in what may be called the lower middle classes, lead to the desire to have fewer children in order that they may be each better provided for, or perhaps, in some cases, from the purely selfish motive of desire to avoid care and trouble and of having more to spend on social pleasures.

A VISIT TO PRINCE BISMARCK.

By MR. G. W. SMALLEY.

ONE of the best, if not the best article in this month's magazines, is Mr. Smalley's account of his visit to Prince Bismarck, which he contributes to the *Fortnightly Review*. It is a long article of twenty-seven pages, and every page is bright and readable. Mr. Smalley gives a charming picture of Prince Bismarck at home, surrounded by his dogs and his water-fowl, full of talk of things past, of things present, and of things to come. The Prince figures much more amiably in Mr. Smalley's pages than in his own speeches. Mr. Smalley found him resigned to ostracism, and almost benevolent to the Emperor.

"My time is over," he said, with a gesture which meant as much as the words. And still more expressively: "I shall not go into action again."

Never once had he a harsh or even a hard word for the Emperor personally. What he said showed, or implied, an odd mixture of respect for the Emperor as Emperor, and of something that was not exactly respect for his abilities or character.

LENBACH'S PORTRAIT OF THE PRINCE.

Mr. Smalley tells the curious story as to how Lenbach, the great portrait painter, caught the expression which flames in his last picture of the Iron Chancellor. Mr. Smalley says:—

The last portrait he painted shows you such a Bismarck as you might fancy thundering at a stubborn majority in the Reichstag; full of righteous anger and stern purpose, lightnings in the eye, and the mouth hard as iron. Well, the history of that portrait is this. Prince Bismarck hates crows because they are the enemies of the singing birds he loves. He and Herr Lenbach were walking in the woods when the Prince caught sight of one of these detested crows on the branch of a tree. It was his sudden glance of anger at the crow which the artist seized—one can imagine the look, fierce, and even deadly if a look could kill—and this it was which was put on paper when they got home, and the sketch became the portrait we see. It was no Socialist, nor Particularist, nor human Philistine of any species, which provoked this Olympian wrath which Lenbach has fixed for ever on the speaking canvas; only a crow, with no love for music or for musical birds.

THE PRINCE AS A TALKER.

Prince Bismarck seems to have an unbounded flow of talk. Mr. Smalley says:—

The talk flowed on for another hour, the Prince choosing his own topics, dismissing one with a flashing sentence, enlarging upon another, the face radiant at times, the eyes burning, and then the fire dying out only to flame up again; and sometimes the cold glitter of steel came into them, and then the words cut like steel.

His conversation ranged over many themes, upon some of which he spoke very characteristically, as for instance when he declared that the Government made a mistake in treating the Socialists as a political party, to be seriously met and argued with instead of as robbers and thieves to be crushed. "I would never have allowed this," he exclaimed. "They are the rats of the country to be stamped out." The Prince omitted to say that his effort in that direction had not been crowned by such conspicuous success as to justify his successor in continuing the same line of tactics. He did not hesitate, however, to assert his utter dissent from the principles of modern democracy—

"There has grown up of late," said Prince Bismarck, "a notion that the world can be governed from below. That cannot be."

HIS VIEWS OF ENGLAND.

Prince Bismarck did not seem to take much interest in England, whose politics seem to him both sterile and trivial. Mr. Smalley says:—

Prince Bismarck's views, so far as he expressed them, may be summed up in a sentence or two:—

"If we have a controversy with England we pay attention to that, and try to understand the English side of it as well as ours. Other international questions, European and not Anglo-German merely, do sometimes, though not very often, make us turn our eyes to England. Otherwise, what chiefly concerns us is the effort of certain parties or persons in Germany to make us copy English Parliamentary institutions."

"This last was said with that gleam of humour which so often lighted up both his face and the subject he was discussing."

OF MR. GLADSTONE.

Of Mr. Gladstone, Prince Bismarck appears to have spoken with scant respect, of which Mr. Smalley says:—

Let us excuse Prince Bismarck so far as we can, and not forget that he has full faith in Mr. Gladstone as an orator.

I quoted, while this topic was still being talked of, the remark of a Frenchman less well known than he deserves to be, M. Doudan, who said of Victor Hugo: "A force de jouer avec les mots, il en est devenu l'esclave;" and this I applied to Mr. Gladstone. "Yes," answered Prince Bismarck, "les mots se jouent de lui." This was the only French phrase he allowed to pass his lips, and with this too came a humorous illuminative gleam into his eyes.

AND OF RUSSIA.

He spoke with more sympathy:—

His old partiality for Russia came out in the remark that, whatever might be Germany's troubles from Socialism, they would never be aggravated from any Russian source. But his faith in the good faith of the Emperor of Russia was not to be shaken. The state of things in Russia seemed to him to forbid such a supposition. "The party of discontent, whether you call it Socialist, or Anarchist, or Nihilist, is much the same everywhere. If it is a danger to Germany, it is equally a danger to Russia—perhaps a much greater danger. The Tzar is not the man to lend a hand to the enemies of order, of society."

HIS OPINION OF THE ARMY BILL.

Prince Bismarck expressed himself at length against increasing the number of men in the army. To increase the number of men would draw off a great many officers to train the new soldiers, which is weakening the army in its vitals. Non-commissioned officers cannot be created offhand. In a war you could not use more than a million troops in three or four battles fought at different points about the same time. As Germany has three million trained soldiers already, he does not see the use of adding eighty thousand more. What the army wants is not more troops, but more cannon, and so forth, and so forth.

One more extract, and I close our notice of this extremely interesting contribution to contemporary history.

ON PUBLIC OPINION.

They were discussing the position of the Press in various countries, and Mr. Smalley appears to have raised the point as to whether or not public men should contradict statements in the newspapers:—

Renan, I said, laid it down as a rule, which he had adopted early in life on the counsel of Bertin, editor of the *Journal des Debats*, never to contradict anything. He did not contradict the current story that the Rothschilds had paid him a million francs for the "Vie de Jésus," nor even deny the authenticity of spurious writings published under his name.

"What is that," said the Prince, "but contempt for public opinion? A writer of books like Renan, a recluse, a man who holds aloof from the world, may be able to afford himself that luxury. A statesman, a politician, cannot. Public opinion is one of the forces on which he relies. If it is corrupted, is he not to purify it? What becomes of his usefulness if he is discredited?"

VARIOUS VIEWS OF THE HOME RULE DEBATES.

MR. E. DICEY in the *Nineteenth Century* has the first place with an article entitled "The 'Arts and Crafts' Exhibition at Westminster." The gist of this article may be gathered from the following passage:—

ARTS AND CRAFTS AT WESTMINSTER.

The exhibition of which I write is not to be found at Earl's Court, or Olympia, or the Agricultural Hall, but in the House of Commons. The products of Art and Craft displayed therein are not of a material, but a moral, perhaps I should say an immoral, character. Yet for all that it is, from an outsider's point of view, a very interesting and instructive show. The grand old farce of "hoodwinking the British public" is performed there nightly with unflinching success. Illustrations of the art of saying one thing and meaning another, of suggesting what is false and suppressing what is true, of confusing plain issues and conveying erroneous impressions, are given evening after evening by the most eminent of Parliamentary craftsmen.

WHO IS BEING HOODWINKED?

Mr. Dicey thus proceeds to specify the various points in which he maintains that Parliaments have been befooled and hoodwinked:—

The Liberals have been led to vote for Home Rule on the plea that the Parliament of Ireland is to be a subordinate legislature, competent only to deal with local matters: it now stands manifest that if the Bill passes, the Irish Legislature is, in fact if not in name, to be the supreme governing body in Ireland. The public were assured, time after time, that every precaution was to be taken to protect the Irish Protestants and Loyalists against any possible interference with their civil and religious liberties, and now it appears the only guarantee offered them is the personal conviction of Mr. Gladstone that the Irish Parliament is never likely to abuse its authority. The Bill was recommended to British acceptance mainly on the ground that its enactment would relieve the Imperial Parliament from the presence of the Irish contingent, and now it is obvious that the Irish, like the poor, are to be always with us.

SOME QUESTIONS FOR MR. GLADSTONE.

Let us know the truth. This, if I were a Home Ruler, is the question I should address to my leaders: Let us be told, in language we can understand, whether the Irish Parliament is to be independent or subordinate; whether the men of Ulster are or are not to be left to the tender mercies of a Celtic and Catholic Administration appointed by a Catholic and Celtic Legislature; whether the resources of Ireland are or are not to be supplemented by subsidies levied at the expense of the British taxpayer; whether the Irish Parliament is or is not to be allowed to pursue a commercial policy inconsistent with, if not hostile to, that of England; whether, in fact, Home Rule is or is not to be tantamount to repeal of the Union. Upon these and any number of similar questions, I—supposing myself to be a Home Ruler on principle—should think it was only due to me to be enlightened before I was asked to pledge myself to Home Rule. Yet, if I asked for an answer I should be met by empty platitudes which may mean anything or nothing.

OCHONE, OCHONE, FOR THE DEAR NINTH CLAUSE!

Mr. Dicey is followed by Dr. Wallace, who raises quite a pathetic lament over the doomed 9th Clause, not that Mr. Wallace loves the 9th Clause—he would prefer to keep the Irish members out of the House of Commons altogether, but he prefers the in-and-out arrangement to allowing them to remain in on all occasions. His argument is ingenious, humorous, and satirical. Of course he is utterly and hopelessly wrong, because he is aiming at an end which the British public has never sanctioned and never will sanction, namely, the erection of Ireland into a virtually independent State. The true formula, as we have always declared, is Home Rule in Ireland as in London, *mutatis mutandis*; and this, Dr. Wallace has the grace to recognise, will be the

inevitable result of the sacrifice of the 9th Clause. He concludes his article with the following declaration:—

Unless you abandon your present attitude, the only Home Rule you are ever likely to achieve is a modified replica in Dublin of the London County Council, an admirable institution, but not embodying the Irish Nationalist idea of self-government.

AN UNPLEASANT ALTERNATIVE.

Considering that no scheme which has yet been proposed by Mr. Gladstone, or anybody else, embodies the Irish Nationalist's idea of self-government, that sneer may pass. The following passage, in which Dr. Wallace replies to those Gladstonians who defend Mr. Gladstone for introducing the 9th Clause, and now support him in abandoning it, shows how strongly Dr. Wallace can state his case when he has his opponent on the hip:—

Either Mr. Gladstone knew that the in-and-out clause was unworkable when he put it in the Bill, or he did not. The first alternative is excluded, because it means that our revered leader has been befooling the country and ourselves to make a tactical catch of the second reading—an insulting and incredible supposition. You must therefore be of opinion that the distinguished man, whom I have often heard you with pleasure describing as the oldest, the wisest, the most gifted, the most accomplished, the most eloquent, the most experienced—in a word, the greatest Parliamentary statesman in the world—is an incompetent bungler in his own business, a fabricator of unworkable clauses, and does not know it, an inventor of machinery that ends in deadlock, a compounder of nostrums that aggravate the disease. And yet you claim to be a better Gladstonian than the like of myself. You must really set a limit to your audacities.

MR. HEALY'S SARCASMS.

In the *New Review* Mr. Tim Healy discusses the tactics of the Opposition in a few pages which he entitles "A Defence." The House, says Mr. Healy, has become a paradise for any adroit Unionist seeking the road to fame. Mr. Healy caricatures Mr. Chamberlain's method of debate, and says that Mr. Chamberlain sits down with an expression of unalloyed satisfaction on his countenance, such as might become the faces of the just on the Judgment Day. Mr. Healy's object, of course, is to press for what he calls railroading the Bill through the Commons. Mr. Healy concludes his article as follows:—

So far from condemning all this waste of time, however, every judge of tactics must hold it perfectly warranted. It is at present the business of the Opposition to waste time. It is equally the business of the majority to prevent waste of time. A majority is a majority, a minority is a minority, and there are, it is understood, considerable limitations of power between one and the other. Scores of members of the present House of Commons never enjoyed the luxury of acting with a majority before, and they are now waiting curiously to learn the difference between the relative advantage of the *plus* and *minus* signs in point of strength.

THOSE who have read Mr. Clem Edwards's account of the Hull strike in the *Economic Journal* may be interested in reading in the *Liberty Review* a paper on the same subject from an opposite point of view by Dr. Hayman. Dr. Hayman is an able man who has invincible prejudices upon some subjects. Mr. H. G. Crews, in the same Review, defends Grocers' Licenses in an article which will not please the prohibitionists.

TO JERUSALEM BY RAIL.—The saving that is effected in money and time by the railway is well illustrated in a fact mentioned by a writer, Mr. Walker, in the *Sunday at Home*, as to the relative cost of going to Jaffa from Jerusalem by road or by railway. If you go by road it takes you twelve hours, and costs you £2; if you go by rail, first class, you go in three hours, and it costs 12s.

"NO FORWARD POLICY IN AFGHANISTAN!" A PROTEST BY LORD CHELMSFORD.

IN the *Asiatic Quarterly* Lord Chelmsford has a very useful paper protesting in advance against the disposition shown in high quarters in India to advance into Afghanistan in case the Russians were to make any move upon Herat.

THE POLICY OF THE INDIAN GOVERNMENT.

Lord Chelmsford quotes extracts from a recently-published paper expressing the opinion of the Governor-General in Council, which, he says, seemed to prove—

that a "Forward Policy" is looked upon both as a political and military necessity, in the event of an attempt being made by Russia to occupy Afghanistan, either by conquest or with the consent of the Ameer. The bitter experiences of all our former occupations of Afghanistan are to be ignored; and we are to embark once more in a sea of troubles, as regards our transport and supplies; our relations with the most treacherous nation on the face of the earth; and the discontent of that portion of our native troops which may form our army of occupation.

OUR TRUE POLICY.

Lord Chelmsford sets forth with much lucidity and emphasis the necessity for abandoning once and for all the suicidal policy of advance beyond our north-western frontier under any circumstances whatever. His idea of the policy which should be pursued, even if Russia were to occupy Afghanistan, is set forth thus:—

It would be necessary to come to a clear explanation with the Amir of Kabul, and to make him understand that we have definitely abandoned all idea of entering his dominions, with an armed force, should Russia advance further towards his borders. He should be told distinctly that he must rely on his own resources in men, and not on any direct assistance from India, should his territories be invaded.

IF RUSSIA OCCUPIES AFGHANISTAN.

The possible occupation of Afghanistan by Russia ought not to give us any cause of anxiety, much less alarm.

At Kandahar and Ghazni she would still be some 300 miles from the Indus river; and at Kabul she would be 175 miles from Peshawar. This zone would practically be a neutral one; as it is occupied, as I have already said, by quasi-independent tribes, very jealous of any interference; and ready to resent any encroachment on their territory. The country is quite unfit for occupation by Europeans; and would always be likely to remain as a convenient buffer between India and Afghanistan proper.

LET US STAY WHERE WE ARE.

Whilst deprecating therefore any undignified alarm at the nearer approach of Russia towards India, I quite recognise the desirability of having the whole of Afghanistan between the two nations, instead of the narrower zone above alluded to, if it can be managed without our making any forward military movement to secure it. It is clear however that the Amir has no military resources at his disposal, sufficient to prevent an occupation of his dominions by Russia; and I am absolutely convinced that it would be a suicidal policy on the part of India, were she to pledge herself to directly assist the Amir.

My sole object has been to try and show that, from a military point of view, there ought to be no danger to India should Russia either take forcible possession of Afghanistan; or occupy the country with the consent of the Amir; provided that proper precautions are taken to increase the natural strength of our frontier. Any forward movement beyond our borders, as at present contemplated by the Government of India, would, I feel sure, defeat the very object it is intended to obtain—viz. the safety of India.

OUR STRENGTH IN INDIA.

Sir Lepel Griffin, in the same *Review*, writes cheerily concerning the safety of India. He says:—

To place 100,000 men on the western borders of India is beyond the strength of Russia in this generation. No doubt, should cause of quarrel arise between us, she would endeavour to annoy and injure us in India as far as possible, but an invasion could have no hope of success.

The quality of the Indian Native troops is little known or appreciated in Europe. Some of the fighting races, who form the largest proportion of our army, are not inferior to any soldiers in the world, when well and sufficiently led by European officers. The Sikhs and Gurkhas are, I believe, superior to Russian troops of the line. They are much of the same quality as the Turks who held the Russians at bay in the last war, and who would have beaten them single-handed had they not been betrayed by their own generals. As to the Native Indian Irregular Cavalry, although it might be increased by twenty regiments with advantage, it is infinitely superior to the Cossack regiments of Russia. The conclusion of this brief article is, that during this generation Russia has nothing to gain, and everything to lose, by attacking us in India.

A Woman's View of Tess.

HARRIET WATERS PRESTON, writing on Thomas Hardy in the *Century Magazine*, gives a woman's view of "Tess of the D'Urbervilles" with considerable emphasis. After describing how Tess, after her first misfortune, was borne safely and almost triumphantly through all her dangers, she says:—

The goal is close at hand where, in Mr. Hardy's own striking words concerning the Native, the fairest child of his fancy may grasp the supreme boon of *retreating from life without shame*. We are actually beginning to thank him for an enlarged perception of the moral possibilities of primitive womanhood. The interest of the narrative has been breathless all along; now, at its final crisis, our pulses begin to throb as though we were on the eve of some stupendous revelation. Has our pantheist and pessimist of other days, we ask, been transformed into the most powerful and penetrating of all the preachers of Neo-Christianity? Are we about to be told, at last, what the words were which Jesus "stooped down and with his finger wrote on the ground, as though he heard them not"—the mystic import of the divine sentence, "Neither do I condemn thee: go, and sin no more"?

Alas! nothing of the sort. Mr. Hardy's conversion is no more authentic than Alice D'Urberville's own. Just when his noble work lacks naught but the finishing touch, he is seized by what looks like a paroxysm of blind rage against his own creation, and with one violent blow he destroys irreparably both its symmetry and its significance. There was no need to condemn the finest of his creations to an after-life of bourgeois security and prosperity as the wife of Angel Clare. That would have been at once too bad for her and too good for him. But surely a kindly, compassionate, natural death might have rescued Tess from her sharp dilemma at any one of the later turnings of her hunted way! Or, if not, she had still the last remedy in her own hand, and the daughter of the D'Urbervilles would never have lacked the courage to apply it. But from the moment when, despite the dreadful illumination of her experience, and the painfully acquired habit of heroic resistance, Tess yields a second time to the importunities of her first and now doubly repulsive seducer, the claim put forth for her by her historian upon his title-page is stultified; and artistically, no less than morally, his work lies in ruin. To call Tess "pure" after this is a ferocious sarcasm. The first stain had been effaced by a purgatory of suffering; the second is indelible. The ghastly incidents crowded into the last pages of the book avail nothing. The murder and the scaffold are mere vulgar horrors, gratuitously insulting to the already outraged feelings of the deeply disappointed reader. They exceed the proper limit of tragedy, exciting neither "pity" nor "terror," but simply repugnance. No writer of our own gloomy time—I say it regretfully, and even resentfully—has grasped for one moment, only to wantonly fling away, a more sublime opportunity than Mr. Hardy in "Tess of the D'Urbervilles."

PRINCESS MAY.

A CHARACTER SKETCH BY MISS FRIEDERICHs.

A BRIGHTLY written and appreciative character sketch of the Princess May, from the pen of Miss Friederichs, appears in the *Young Woman* for July.

HER CHILDHOOD.

Miss Friederichs says:—

Of the early childhood of golden-haired Princess May nothing is known to the outside world. But those who knew the Duchess of Teck in her girlish days, often noticed how her bright, cheery manner, her kindly, sympathetic disposition, and, of her personal appearance, the clear rosy complexion and the abundance of fair silky hair, had descended upon the child. A friend of the Duchess of Teck's youthful days has often told me how they used to beguile the long winter evenings at the Castle of Mecklenburg Strelitz with merry games and gambols. Princess Mary, then a very lovely girl, was fondest of the games which involved much noise and rushing about; and sometimes, in a wild, mad chase through the long corridors, she would suddenly come to a standstill when the silver arrow round which was coiled her magnificent mass of fair hair had slipped out, and she would stand enveloped in what looked like a long cloak of waving gold.

HER INDUSTRY.

Princess May is far too active to waste even an hour of her day. Indeed, it happens very often that, when visitors call at White Lodge, she rises quietly during a pause in her animated chat with her own or her parents' friends, and says smilingly, "You will pardon me, I know, if I get my knitting and do some work while we talk. There is really so much to do, it seems quite wrong to be idle." And she comes back with a thick half-finished stocking, or some piece of plain needlework, and stitches while talking—stitches that some shivering creature may be less miserable in cold and wintry days. And often, when alone with the friends of her home circle, a sigh would force its way across her lips, and she would say, with a look at the heaps of needlework before her, "Oh, if I had only half of the time given to me as a present, in addition to my own time, which so many girls waste in doing nothing at all!"

HER EDUCATION.

For Princess May is distinctly a clever girl, from the intellectual point of view. She plays the harp and the piano-forte, and plays them well; for she has had a very thorough musical education. Signor Foli, her singing master, has trained her voice, which, though not powerful, is very sweet and sympathetic; and her German and French are as fluent as her native tongue. Not long ago, Princess May attended a course of lectures on Elizabethan literature, delivered by Mr. Churton Collins at Richmond, in connection with the University Extension movement, thereby ranging herself with the "Extension students," and by doing so, helping on one of the best educational movements of the time. In this simple, practical way she prepared herself unconsciously not only for the prominent position which the future has in store for her, but also, by constant acts of unselfishness and of self-control, for the stern school of discipline through which she was destined to pass so soon.

HER BEAUTY.

If you have never seen Princess May you can hardly form an idea of how very attractive she is. Hers is not one of the faces to which either photographer or artist can do justice, unless, indeed, he be Mr. G. F. Watts, the patriarch master painter, who succeeds in causing the soul to shine through the face where no one else can "catch" the gleams of inward light. The expression in her blue eyes—blue as cornflowers—changes so rapidly, is one moment so gay and roguish, the next so grave and thoughtful, and again so composed and calmly intelligent, that the photographer may well despair when he compares even the best of his productions with the original. Apart from her unusually expressive face, Princess May is a girl of the true English type, with a fair complexion, a healthy glow in her cheeks, a tall pretty figure, and light and graceful movements. She is also truly English in her

fondness for all kinds of outdoor exercises. She rides and drives well; and, thanks to her three brothers, all of whom are equally devoted to "May," though, with characteristic brotherliness, they disguise this fact occasionally a little, she is not easily beaten at tennis.

LAST YEAR.

After the death of the Duke of York's eldest brother, to whom the Princess May was first engaged to be married, Miss Friederichs says:—

For many months, though she was busier than ever with her labours of love, no ray of sunlight seemed to be able to pierce the gloom that had fallen upon the life of Princess May. All her endeavours were to help others, to make the lives of others brighter; but her own burden—so those around her saw with aching hearts—her own burden was, and remained, very heavy. Only once or twice she lost her perfect self-control. It was when, by chance, she read of the heartless suggestions made by one section of the public press, that the Duke of York should forthwith do his duty to her, and to the nation, by marrying her. "It is too cruel—too cruel!" she said, with burning tears. "Why may not I have the privilege of privacy at such a time as this, which every other girl in private life may have?"

Of which let the *Spectator* and its editors take due note.

HER TASTE IN RELIGION AND MUSIC.

Two writers in the *New Review* contribute studies in character of Princess May. Both are anonymous, the first much the most interesting. The writer says that the Princess is a regular church-goer and communicant, who is extremely tolerant in her views, but very punctual in reading her Bible every day; no matter how much work she has to do, she always reads her chapter. She is not attracted either by high Ritual or by low Church; she loves the music of the organ and the singing of a well-trained choir:—

She is very fond of singing, and her voice, although not strong or of great volume, is sweet and sympathetic. For the modern love-song the Princess has no fancy, but prefers words more in keeping with her every-day thoughts. "The Lost Chord" and "The Convent Gate" are among her favourite songs. She very often gets up concerts in the surrounding villages, and is exceedingly kind to struggling professionals. During the stay of the family in the northern capital of Italy, Princess May took lessons from Italian professors, and began to cultivate her taste for music, art, and literature, a taste which developed very much under the tuition of Mdlle. Bricka, who had succeeded Mdlle. Gutmann, and still remains as companion to her late pupil.

HER FAVOURITE BOOKS.

French, German, and English are all alike to Princess May. She can converse fluently in either one or the other language. Novel-reading does not interest her very much—that is to say, novels of a frivolous kind. But with the works of the great novelists she is, of course, acquainted. On her book-shelves you will find no uncut and dusty books, but neatly cut edges and well turned pages. Her favourite authors are Tennyson, Carlyle, Emerson, and George Eliot. She is very fond of well-bound books, and values highly all presentation copies. The works of Macaulay, Froude, Lamb, John Morley, Motley, Molière, Goethe, Dante, occupy prominent positions on her book-shelves. Her method is to read something every day, even if it be only a page, and then to discuss what she has read. With her companion-governess she talks French and German, and, according to arrangement, the discussion takes place in either one language or the other. Mdlle Bricka is a very broad-minded woman, and thinks that as princesses are women, they should know as much as possible about what appertains to women. Order and regularity are with her principles of life—never is anything out of place, never is an appointment missed. There is a time for getting up in the morning, and, when possible, a time for retiring to rest at night.

HER LOVE FOR CHILDREN.

The Princess's love of children is great. A suffering child at once commands her sympathy. Out of her income she always sets apart a sum to give away to poor children. Her aim and object when dealing with the poor is to make their lives pass as pleasantly as possible. She carries her sympathy into deeds. Every Christmas, New Year, and birthday card is carefully preserved by the Princess, who arranges them in scrap-books for the poor children in homes and hospitals. No cotillion favour is ever thrown away; each toy and ribbon is put away in a drawer to be used, when the time comes, for her "Sea-shell Mission." Similar odds and ends are collected by her friends, so that often the parcels contain sufficient presents to give something to each child in an institution. Many a sad little heart is made glad and many a young life brightened by the Princess's Mission.

HER SYMPATHY WITH THE POOR.

A crippled boy in a village near White Lodge was dying of consumption. Over and over again Princess May would either drive or walk over to see the little sufferer, and, sitting down by the bedside in the cottage, would talk and read to him. Often she carried with her delicacies to keep up his wasting frame. Her last visit to the boy was one day on her way to church, when she knew the end was near. Gently giving him a kiss, she wished him good-bye with tears in her eyes. I could tell of many actions of a similar kind, but this one will suffice to show her tender-heartedness and sympathetic nature.

But it is in her work and in her mother's work that she is really interested. This subject she will discuss with animation and a knowledge seldom to be found in so young a princess. In State schemes for the poor of the country she is also greatly interested. During the time the House of Lords' Sweating Committee was sitting she carefully read the evidence given, and evinced the greatest sympathy with the hard lives of poor seamstresses and nail and chain workers. With so sensible a guide as her companion, and so sympathetic a mother, it is not surprising that Princess May's reading has not altogether been confined to books for the "young person." It is possibly in some measure due to this more liberal course of reading that we find Princess May's knowledge of things as they are to be far greater than that of any other princess of her age.

"The Heavenly Twins."

THE *Modern Review* publishes a couple of articles which it calls the "Sarah Grand Sex Theory." The first writer, "Egeria," declares that the book ought to have been called "The Revolt of a Sex." "Egeria" does not like Evadne, whom she regards as an egoistical, self-righteous, complaisant young woman, who with her scientific education ought to have had more sense than to imagine that Major Colquhoun could possibly, with his physical organisation, have been other than a Tom Jones. Miss Catherine M. Whitehead is very enthusiastic, and considers "The Heavenly Twins" heralds the dawn of a new age that is springing up for women, and that all women therefore owe it a debt of gratitude:—

The absence of the sense of sex on the part of Evadne is commented on in one review. But she surely belongs to that class of women who, when her ideal is shattered, loves no longer the mere outside shell which enfolded it. For a while at least passion sleeps beneath the ruins of the volcano which poured its burning lava down until she became petrified beneath the weight. Evadne's powers of mind upheld her to a certain extent through the crisis, though how they suffered is clearly shown by the benumbing process which followed. How little men can understand the thousand deaths a woman dies when her ideal falls before her eyes!

"Mr. Henley as the New Poet."

MR. GILBERT PARKER in *Lippincott* writes half-a-dozen enthusiastic pages about Mr. Henley, of whose influence on literature he speaks very highly. He says:—

He has dared to say things, he has dared to do things, which others have hesitated to say and do. He has opened a way for a larger, deeper convention. He has broadened our view by his daring, and his strength by his fine art.

Scribner's Magazine publishes a long poem by Mr. Henley entitled "Arabian Nights' Entertainments." It is a reminiscence of his youth when, a little boy on Severn side thirty-five years ago, he first revelled in the charm of Arabian Nights. It is full of characteristic Henleyisms.

Samaracaud!

That name of names! That star-vened belvedere
Built against the Chambers of the South!
That outpost on the Infinite!

The Normal Young Woman and Young Man.

IN *Scribner's Magazine* there is an account given of the investigations of Dr. Sargent of Boston, who has measured the bodies of over 2,000 Harvard students, and who has constructed two nude clay figures representing the average or composite of 5,000 Harvard students of the age of twenty-one, and of 5,000 girl students of different colleges measured at the same age. According to Dr. Sargent the normal young man is much finer in physique than the normal young woman, which is not in the least to be wondered at, considering how much more attention is paid to the physical culture of man than that of woman:—

Standing squarely, clean-limbed, strong-necked, he looks rather like a runner than a rower; but there is nothing sordid, nothing warped, nothing to indicate the deterioration of a civilization of too many wheels, the stunting, or the abnormal one-sided development, of the factory or of city life. The pose, of course, must be the sculptor's, but the measures show: height, five feet eight; weight, one hundred and thirty-eight (the equivalent of one hundred and forty-nine, as we clothe ourselves); chest, thirty-four, to thirty-seven inflated. Lung power is there and heart; strength enough to hold his own in life, and withal a certain refinement, a curious grace of mould, which our fathers would have called aristocratic, and we would term, as even our age may permit us, finely bred.

Of the American women students it is said that they do not come from as high a class, socially and intellectually, as the men, and the result is seen in the clay model:—

Brutally to set forth the facts, the figure has more fragility without a corresponding gain in grace; the lower half is better than the upper; it is not that tight-lacing has left evident traces (the waist is over twenty-four), but the inward curve of the back, the thinness of the body, lack strength and erectness of pose. At this point one hurriedly resorts to figures: the height is five feet three, the weight one hundred and fourteen, the chest measurement but thirty, and the feet (the figure will be seen at Chicago) ten inches long.

IN the *Canadian Magazine* for June, Mrs. Cecil Logsdail devotes a paper to criticism of the women of the United States. The writer says that if in England it were better understood that nature has gifted women with other capacities than for suffering, and if her mission were more generally understood outside society in its narrow sense, there would be considerably less unhappiness in married life, and a finer, nobler race would spring up.

THE PROTESTANTISM OF THE BRITISH SAILOR. ITS ORIGIN. BY MR. FROUDE.

In *Longman's Magazine* there is a very charming paper by Mr. Froude, which is chiefly devoted to an examination of the cause why Protestantism in the sixteenth century had its stronghold in the seaport towns of England. Mr. Froude says:—

I have in my possession a detailed account of the temper of parties in England, drawn up in the year 1585, three years before the Armada came. The writer was a distinguished Jesuit. The account itself was prepared for the use of the Pope and Philip, with a special view to the reception which an invading force would meet with, and it goes into great detail.

THE ELIZABETHAN PURITANS.

According to this authority, who evidently seems to know what he is talking about—

"The only party, the only party that would fight to death for the Queen, the only real friends she had, were the Puritans (it is the first mention of the name which I have found), the Puritans of London, the Puritans of the sea towns." These he admits were dangerous, desperate, determined men. The numbers of them, however, were providentially small.

Mr. Froude then addresses himself to an explanation of the causes for this concentration of the Protestant patriotism in English seaport towns.

THE WORK OF THE INQUISITION.

He attributes it, not to any theological conviction on the part of the Elizabethan sailors, but simply and solely to the fact of the horror inspired by the Inquisition. Mr. Froude says:—

A new and infinitely dangerous element had been introduced by the change of religion into the relations of English sailors with the Catholic powers, and especially with Spain. In their zeal to keep out heresy, the Spanish government placed their harbours under the control of the Holy Office. Any vessel in which an heretical book was found was confiscated, and her crew carried to the Inquisition prisons. It had begun in Henry's time. The Inquisitors attempted to treat schism as heresy, and arrest Englishmen in their ports. But Henry spoke up stoutly to Charles V., and the Holy Office had been made to hold its hand. All was altered now. It was not necessary that a poor sailor should have been found teaching heresy. It was enough if he had an English Bible and Prayer Book with him in his kit; and stories would come into Dartmouth or Plymouth how some lad that everybody knew—Bill or Jack or Tom, who had wife or father or mother among them, perhaps—had been seized hold of for no other crime, been flung into a dungeon, tortured, starved, set to work in the galleys, or burned in a fool's coat, as they called it, at an *auto da fé* at Seville.

PROTESTANTISM HELPED BY PERSECUTION.

The object of the Inquisition was partly political; it was meant to embarrass trade, and make the people impatient of changes which produced so much inconvenience. The effect was exactly the opposite. Such accounts when brought home created fury. There grew up in the seagoing population an enthusiasm of hatred for that holy institution, and a passionate desire for revenge.

The Holy Office burnt English or French Protestants wherever it could catch them. The Protestants revenged their injuries at their own risk and in their own way, and thus from Edward VI.'s time to the end of the century privateering came to be the special occupation of adventurous honourable gentlemen, who could serve God, their country, and themselves in fighting Catholics.

So it went on until Elizabeth's reign, and the more the Inquisition burned our sailors, the more resolute did our seafaring men become to wage war to the death against the devildoms of Spain and of the Holy Catholic

Church, which found in Spain its most cruel and ruthless instrument.

NEMESIS.

Mr. Froude concludes his paper as follows:—

The Holy Office meanwhile went on in cold savage resolution: the Holy Office which had begun the business and was the cause of it. A note in Cecil's hand says that in the one year 1562, twenty-six English subjects had been burnt at the stake in different parts of Spain. Ten times as many were starving in Spanish dungeons, from which occasionally, by happy accident, a cry could be heard like this which follows. In 1561 an English merchant writes from the Canaries:—

"I was taken by those of the Inquisition twenty months past, put into a little dark house two paces long, loaded with irons, without sight of sun or moon all that time. When I was arraigned, I was charged that I should say our mass was as good as theirs; that I said I would rather give money to the poor than buy Bulls of Rome with it. I was charged with being a subject to the Queen's grace, who, they said, was enemy to the faith, Antichrist, with other opprobrious names; and I stood to the defence of the Queen's Majesty, proving the infamies most untrue. Then I was put into Little Ease again, protesting very innocent blood to be demanded against the judge before Christ."

The innocent blood of these poor victims had not to wait to be avenged at the judgment day. The account was presented shortly and promptly at the cannon's mouth.

An Irish Catholic View of Hodge and His Religion.

THERE is an interesting article in the *Lyceum*, the writer of which reviews Mr. Heath's book on "The English Peasant," from the point of view of an Irish Catholic. The following passage is very curious:—

Nothing, perhaps, shows the wretchedness of rural England so much as the fact that Calvinism is the only form of religion that has any real hold over the peasants; there is something in the terrible hopelessness of that creed that harmonises with life as they know it. Otherwise there is little or no religion amongst the agricultural labourers. There are districts where there is absolutely no religion, and in other districts it exists but only nominally. The people don't go to church, or if they do, it is in careless compliance with custom. Even among the virtuous peasantry there is a great deal of indifference. One of them spoke for his class when he told Mr. Heath that he was a Wesleyan himself, but that he thought "we should never be asked what we'd been." In some parts of England there is a natural, perhaps inherited, bent towards Paganism so strong that Christianity never seems to sink in, but has to be laboriously grafted on each generation, from the outside. But after all, who can wonder at the people's attitude towards religion? It has been nothing to them for so long a time, but a perfunctory weekly discourse from a man whose nature, sympathies, and worldly position made him one with their masters.

"The Size of the Sea."

MR. SCHOOLING has a curious paper in *Longman's Magazine*, in which he calculates what the sea would cost to remove it, if a contractor undertook to shift it at 1d. per 1,000 tons. If he performed his contract his bill would amount to 10,000 times the amount of the National Debt. If the sea could be piled up in a round column reaching to the sun, the column would be 24 miles in diameter. If you could sell the sea at 1d. per 10,000 gallons, it would fetch 155 billion pounds; if you were to try to pump it dry at the rate of 1,000 gallons a second, it would take 12,000 million years. If you take a crown-piece as representing the surface of the planet, half-a-crown will represent the surface of the whole sea, a shilling the surface of the Pacific, and a threepenny-piece the surface of the Atlantic.

THE CATHOLICISM OF THE NEW ERA.

BY PÈRE HYACINTHE LOYSON.

PÈRE HYACINTHE LOYSON publishes in the *Contemporary* for July an article which begins "Paris, Whit-Sunday, 1893. This is my Testament." As he is now sixty-six years of age, he stands on the brink of the tomb before the bar of the Supreme Judge. He begins with a survey of his life, with which he seems to be very well satisfied. When he was eighteen he became a priest, when he was thirty he became a monk, when he was forty-two he was excommunicated, when forty-five he married—and that marriage he declares was the most logical, the most courageous, the most characteristic act of his life. That life has been devoted to two causes: that of his country and his Church. Notwithstanding the destruction of many illusions, he continues to believe in both.

THE POPE OF THE NEW ERA.

I have never abjured Catholicism; I have never replied by anathema and insult to the insults and the anathemas which have been heaped upon me. I have hoped against hope. I have said to myself that perhaps some day there will arise a successor of Pius IX. and of Leo XIII., who will be as superior to the opportunism of the second as to the intransigence of the first; a true reformer, who will take the Church's transformation in hand, beginning with the Papacy, and who will be the herald and architect of the new era. It would be a miracle, I admit. But by how much I reject the false miracles by so much I implore the true. And should it please Almighty God, in whose hands are all the hearts of the sons of men, to raise up such a Pope, the world would have seen no greater man since prophets and apostles walked her soil, nor any day so great since the day of our redemption.

A TRANSFORMED CATHOLICISM.

Whether the Pope of his dream comes along or not, he is convinced that Catholic Christendom is changing:—

For myself, the more I consider it, the more I am persuaded that Catholic Christianity is approaching a transformation. It seems as if the Lord were saying a second time, as once to the prophet, "Behold, I create new heavens and a new earth; and the former things shall not be remembered, nor come into mind."

We shall keep with religious reverence the oracles of the prophets of Israel and the apostles of Christianity, the teachings of all the inspired saints of the two Testaments; but we shall no longer confound the Word of God with the human alloy from which a sound exegesis is separating it every day. Doubtless God has spoken to men, but He has spoken to them by men, and by men of a rude race and of early or even barbarous times.

THE TRUE CATHOLICISM.

Père Hyacinthe, like many others who are fascinated by the Catholic ideal, is repelled by the Catholic Church because it is not Catholic but Sectarian, representing only a segment of the truth which God has revealed to men.

Nor is the Biblical revelation the only revelation, though it be the highest. There is something of God in all the great religions; which have presided over the providential development of humanity. It is not true that all religions are equally good; but neither is it true that all religions except one are no good at all. The Christianity of the future, more just than that of the past, will assign to each its place in that work of "evangelical preparation" which the elder doctors of the Church discerned in heathenism itself, and which is not yet completed. It will beware of pronouncing on these rough sketches of religion a hard and unmerited reprobation. Through all these divisions, all these conflicts, it will yet work out that luminous synthesis of truth.

Science, again, must not be ignored. It also is a revelation, at once human and divine, and no less certain than the other. Some day will be realised the daring forecast of Joseph de Maistre: "Religion and science, in virtue of their natural affinity, will meet in the brain of some one man of genius—perhaps of more than one—and the world will get what it needs and cries for: not a new religion, but the revelation of revelation."

THE CHRISTIANITY OF THE FUTURE.

Such a faith in which religion and science can lie down together, like the lion and the lamb in the prophecy, will have plenty to do in putting the world to rights.

The Christianity of the future will reconcile more and more, in human life, those elements which are all equally necessary, and which have hitherto been too much divided. It will reclass the links of close alliance between nature and grace, between labour and prayer, between action and contemplation; between the body, despised and accursed in the name of the soul, and the soul of which it bears the imprint and is the organ; between family life, depreciated as an ignoble and inferior state, and those highest aspirations of genius and sanctity which have sought to express themselves in an unnatural and irrelevant celibacy.

HIS LAST WORD.

Père Hyacinthe then sums up the last word of his last testament:—

It is not to politics, and it is not to science, and certainly it is not to the interests of men or the utopias of dreamers, that we must look for the salvation of France or of the world. Our salvation must come from Christianity alone. But to work this miracle, Christianity must regain its true character; it must be the religion of the gospel, the religion of justice and of charity. It must tear itself free from the superstitions which degrade it, from the sects which rend it into fragments, from the clerics and the governments who enslave and exploit it.

Moral and social renovation, by means of religious renovation, this is my last hope, my last word—*novissima verba!* France, the soul, and God—in these I sum up all that I have believed, all that I hope, all that has been the joy of my life and will give me strength to die.

Prices Current for Wild Beasts.

In *McClure's Magazine* for June, Mr. Raymond Blathway publishes the first of an interesting series of interviews with Hagenbeck of Hamburg, wild beast purveyor to the civilised world. From this article I extract the following prices current of wild beasts, in case any of our readers wish to start a private menagerie of their own:—

A hippopotamus costs £1,000. An Indian tapir costs £500, an American tapir £150. Elephants vary according to size and training, from £250 to £500. A good forest-bred lion, full grown, will fetch from £150 to £200, according to species. Tigers run from £100 to £150, according to their variety. "Do you know," he continued, "that there are five varieties of royal tigers? And, besides them, there are the tigers which come from Java, Sumatra, Penang, and even from the wastes of Siberia. Snakes are very much down in the market at present. Those which formerly fetched £5 or £10, you can now get for £2. Very large ones sometimes run up to £50. Leopards £30. Black panthers £40 to £60. Striped and spotted panthers £25. Jaguars run from £30 to £100. A good polar bear will fetch from £30 to £40. Brown bears from £6 to £10. Black American bears from £10 to £20. A sloth from Thibet £25 to £30. Monkeys run from six shillings apiece. They are most expensive in the spring, when they will sometimes fetch as much as £1 6s. Giraffes are altogether out of the market," continued Mr. Hagenbeck with a sigh, "for there are none now to be obtained. I have sold one as low as £60, whilst the last one which I sold, four years ago, to the Brazils, I was paid upwards of £1,100 for."

A CALL TO ARMS TO PROTESTANTS.

BY ARCHDEACON FARRAR.

In the *Contemporary Review* Archdeacon Farrar publishes an article entitled "Undoing the Work of the Reformation," which is a veritable cry to arms. Archdeacon Farrar says:—

The time has come when it is the plain imperative duty of every true member of the English Church to reassert, at all costs, the principles—the scriptural, the primitive, the historic principles—the assertion of which is the sole reason why their Church, as a Reformed Church, has any title to exist.

The Archdeacon then proceeds to set forth the foundation upon which he bases his belief that the Church of England is Protestant, not Catholic in the Ritualist sense.

NO SACERDOTALISM.

There is, for instance, no shadow of even possible doubt what is the teaching of the Bible, of the Prayer-book, and of the Church of England about the clergy. The setting up of the Presbyterate as a sacrificial priesthood; the pretence that the ministry is vicarious, not representative; the assimilation of the English clergy to the "massing priests" of the Middle Ages; the claim that our presbyters perform acts of sacrifice as substitutes for the people—are demonstrably unjustifiable. To the proofs that they are so, no attempt of an answer has been, or can be given, except on premises which our Church has deliberately rejected.

NO TRANSUBSTANTIATION.

The doctrine of Sacerdotalism is always allied to the doctrine of Transubstantiation, and Transubstantiation is one of the heresies which the Church of England at the Reformation most decisively and most emphatically repudiated. She might well do so. It is a late and gross corruption of crude materialism, not formally accepted even by the Church of Rome till the Lateran Council of 1215. The argument for it, such as it is, ignores the whole analogy of the faith.

NO CONFSSIONAL.

Auricular Confession is the natural result of sacerdotal encroachment and sacramental materialism; and if the once-Protestant laity of the Church of England can look on unmoved and see this practice—which has in all ages been prolific of the worst evils—reintroduced among them, it can only be either because they have been driven into contemptuous indifference by having been first betrayed, and then reduced to helplessness, or because they look elsewhere than to the Anglican Church for freedom and for truth.

For of auricular confession there is not the faintest vestige in the New Testament. It was absolutely unknown to the primitive Church. It was absolutely unknown to the Fathers, even amid the dense overgrowth of sacerdotal usurpation and corruption in the fourth century. It was a gradual innovation of the darkest part of the Dark Ages, and I have no hesitation in saying—and am perfectly prepared to prove to any extent—that it has been stamped by age after age with the just stigma of indelible abhorrence.

A PROPHECY OF DOOM.

Already, like a swarm of locusts, Ritualistic practices have settled on every green field. In twenty years, if things are suffered to go on at the present rate—if the cause of the Reformation is on every side abandoned and betrayed—the Church of England will be Romish in everything but name.

But there is another class—a class unhappily of disastrous and ever-increasing magnitude—which will never accept such a form of religion as Rome or the Ritualists offer. It is not averse to the simple gospel of Christ, but it is now being driven into indifference. There are thousands in England, where fifty years ago there were only scores, in the Upper Classes, who now devote their Sundays exclusively to worldly amusements, who rarely enter a church, and scarcely ever

dream of partaking of the Holy Communion. In the working classes such men may be counted by millions, and their numbers will steadily increase as Ritualism increases. England may be driven by Ritualism into infidelity, but I believe that she will have to reel back into barbarism before she becomes Romish, or again accepts the form of religion which the Spanish Armada would have forced upon us with stakes and implements of hellish torture. Disestablishment will be one of the first consequences of the triumph of Ritualism; and immediately after Disestablishment will come the necessity for, and the certainty of, a New Reformation to re-establish the truths which Ritualism endeavours to overthrow.

The Royal Road to Languages.

In the last note on this system in the May number a somewhat unfortunate error crept in which might cause uncertainty in the minds of teachers who were interested in the new method of language teaching. It was said that "it has been found that those who have had some training" never appreciate the points of the system. This should have been those who "have had no training." The method depends for its success a good deal on the liveliness and skill of the teacher, who must speak the language well and know exactly what to do in conducting the class. Lectures were given on the method by Mr. H. Swan last month before the College of Preceptors, London, Canon Daniel in the chair; and before the Ladies' College, Cheltenham, Miss Beale in the chair; and reports will be found in the *Educational Times* for July, and in the *Cheltenham Examiner*, June 21. A fifth and sixth holiday training class for teachers on the series method will be held in London (at or near Essex Hall, Strand) from Tuesday, August 8 to 18th, and also from September 5 to 15th, mornings, two hours a day. Application should be made in advance to Messrs. Swan and Bétis, 4, Mount Ararat, Richmond. I understand several teachers from America intend to be present, and the Norwegian Government also have notified an intention to send a representative to go into the merits of the system after hearing of the results published in the *REVIEW OF REVIEWS* for January last.

The Press and Bubble Companies.

MR. B. D. MACKENZIE, in the *Gentleman's Magazine* for July, writes at some length on "Limited Liability." There is one passage in his article which deserves to be taken to heart by journalists and by those legislators and judges who forge the chains in which journalists have to move:—

Valuable assistance has often been rendered to the public in the wise selection of sound investments by the City editors of the daily press, and the specially qualified writers of the better-class financial journals. But this aid might easily be made much more effective. There is not much use moralising over mischief after it has occurred; a pound of prevention is worth a ton of cure. Whether the press are silenced by the bribe of repeated highly-paid advertisements, or from fear of the very loose law of libel, and the uncertain temper of juries, the fact remains that Companies are launched and Foreign Loans floated which the slightest examination must satisfy any competent man are deserving only of severe censure and prompt exposure. The mere publication of a prospectus ought legally to justify any competent City editor in freely criticising without malice the character of any public investment and its promoters and directors, demanding, on behalf of his readers, adequate information and substantial guarantees upon which a sound judgment may be formed. The character and conduct of politicians are criticised with merciless rigour, some of which might well be spared for the projectors and directors of public companies.

THE TZAR AND THE POPE.

SOME SIDE LIGHTS FROM M. DE BLOWITZ.

In *McClure's Magazine* for June M. de Blowitz discusses *more suo* upon the state of Europe. He professeth peace on several grounds, but primarily because of the social trouble in Belgium. He says:—

It is in the light of these events in Belgium, that I do not hesitate to say, that Europe for a long time still will not be menaced by war. The social problem is now too pressing. It requires the entire attention. Woe to the blind! The hour of rest is past; a new world awakes. It knows its strength. It has everything to gain, nothing to lose. Follow it with anxious eye, ye who sleep now in possession, for if ye sleep too long, ye will awake in chains!

THE PEACEKEEPER OF EUROPE.

M. de Blowitz is overwhelmed by the contemplation of the power of the Tzar, reflecting that Alexander III. has but to lift his finger and all France will do his bidding. But the pious correspondent is consoled:—

However, this autocrat so formidably armed is well known to be absolutely pacific. He turns a constantly listening ear to the counsels of an experienced queen, herself full of the spirit of peace, the Queen of Denmark. This queen loves Germany; she adores the young emperor, whom she calls "an angel." She has already smoothed down many rough places. It was she who brought about the Kiel interview and the visit of the Czarevitch to Berlin. She has strengthened the idea of peace in the brain of this emperor, whence, instead, war might spring full-armed; war *fin de siècle*; the new, mysterious, unprecedented form of it; the war of infinitely multiplied murder, covering the Old World with corpses of the slain. The special factor of armed explosion most to be dreaded in Europe is thus held in check by an all-powerful hand gently directed. It is nothing less than the work of God that has made him who holds the chief of the arsenals of power, pacific, and thus reassuring to the world.

THE WIREFULLER OF EUROPE.

Next to M. de Blowitz's picture of the Tzar, the most interesting description in his paper is that which he gives of the Pope:—

No one can have any idea of the life and movement which reigns in this voluntary prison which lies over against the Quirinal. Thither flow innumerable missives from every corner of the world, and could I only tell some of them, it would be seen how long still is the arm extending from the shadow of St. Peter's; how dreadful still are the lips that speak in the shade of the Vatican. I should show the Holy Father and his cardinals writing to the Emperor of Austria, directing him by counsel and advice, and sometimes almost by their orders. I should show Prince Bismarck continuing, since his fall, to hold before the eyes of the Pope glimpses of the more or less partial restoration of the temporal power. I should show Leo XIII. now trying to unite, now to alienate, France and Russia, according as at the moment this or that policy seems to him most propitious for his own cause or the cause of peace; and I should show, at the same time, the Vatican divided within itself, and Cardinal Vanutelli working, in secret letters addressed to powerful sovereigns, against the policy of Cardinal Rampolla, and acting on the mind of Leo XIII. to detach him from his secretary of state, and wean him from the democratic policy on which he is now launched. I should show, also, all the leading politicians of France, whether in power or out, soliciting the support, the protection, the favour of Leo XIII. and the latter working with astounding insight for the fusion, more and more complete, of the liberal monarchical party with the Republic.

The article, which is illustrated by a portrait of the great little man, is in a more *glamboyant* style than is permitted in the columns of the *Times*.

DR. LUNN AND THE WESLEYAN SANHEDRIN.

THE Wesleyan Conference, like other Sanhedrinitical assemblies, has no love for those of its own members who venture to speak disrespectfully of the idols in its market-place. The fate which has befallen the Rev. Dr. Lunn is probably intended as a warning against any too great zeal in discerning the shortcomings in the official methods of doing good. Dr. Lunn criticised, somewhat crudely perhaps, but still honestly and from personal knowledge, certain principles of missionary action dear to the Wesleyan Society in India. His criticisms undoubtedly directed attention to the subject, and led to the adoption of considerable reforms. But instead of gratitude the Wesleyan Sanhedrin regarded with resentment the man who had troubled the peace of the official Israel. Dr. Lunn, having no fixed pastoral charge, became chaplain to the Polytechnic, founded and edited the *Review of the Churches*, and undertook the organisation of the pious picnics which are the precursors of the modern pilgrimage. There is nothing in these laudable and useful pursuits incompatible with the calling of a Wesleyan minister, any more than the scientific researches of Dr. Dallinger or the journalistic labour of the editor of the *Methodist Recorder*. But Dr. Dallinger had not offended the Sanhedrin, and the editor had only made it ridiculous by the excess of his zeal in its defence. Therefore, Dr. Lunn was singled out for expulsion, which he anticipated by his resignation. So the Conference thanks God, with Dogberry, that it has got rid of a knave; and then sits down placidly to hold sweet communion with Mr. Hugh Price Hughes, who edits the *Methodist Times*, through which Dr. Lunn had perpetrated his enormities. But then Dr. Lunn, although able and energetic, can be jumped upon with safety, whereas to jump upon Mr. Price Hughes might be inconvenient. And, besides, it is so much easier to let him off this time as a reward for behaving himself more seemly in the future.

In the *Review of the Churches* Dr. Lunn reviews the whole controversy, and concludes as follows:—

On the advice of many of my best friends I have resolutely adopted—if the paradox is permissible—an attitude of indecision, and shall take the opportunity of a quiet holiday in Switzerland to consider well before taking any decided step. There are, however, two or three facts and two or three considerations which are manifest, and will no doubt influence my ultimate decision. In the first place the ministry which I received from a Higher Source than the Wesleyan Conference is not affected by my resignation. In the second place my sphere of service to the Church of Christ at the Polytechnic is also unaffected. In the third place my position as a class-leader in the Wesleyan Methodist Church is also unaffected, and there is nothing in Methodist polity to hinder my continuing to render such service as I am able in Wesleyan Methodist pulpits. The considerations which will weigh very heavily with me in my final decision are, in the first place, that I must take no step which will injure the movement which this Review was founded to represent; and secondly that I can never take up a position which would necessarily involve any expression of doubt as to the validity of my own ministry in the past, or the present validity of the ministry of those eminent representatives of the Free Churches who have worked with me in this movement. I have ever held to the truth of the great patristic saying, "*Ubi Christus, ibi Ecclesia*," and whether I find it possible to remain a member of the Wesleyan Methodist Church, or am compelled to seek another spiritual home, I can never take up a position inconsistent with this great saying.

ENGINEERS and railway men will be interested in reading Mr. Lodian's paper in *Cassier's Magazine* for May upon "Fast Trains of England and America."

WORK, WORK, WORK!

THE GOSPEL ACCORDING TO M. ZOLA.

THE *New Review* publishes the full text of the address which M. Zola delivered to the Paris Students' Association some weeks since, brief notices of which appeared in the English press. The article is well worth careful perusal. After describing the despairing cry for happiness which arose on all sides, and which nothing could satisfy, M. Zola said the sound filled him, old and hardened Positivist as he is, with infinite pity. Without attempting to summarise all his remarks, I quote some of the concluding passages in which he preaches the gospel of labour.

TOIL, YOUNG MEN, TOIL!

I will conclude by, in my turn, offering you a faith, by beseeching you indeed to put your trust in work. Toil, young men, toil! I am quite conscious of the triteness of the advice. There is not a distribution of prizes at any school but it falls upon heedless, indifferent ears. None the less, I ask you to reflect upon it, and venture—I who have been nothing but a toiler—to tell you how great has been the benefit that I have derived from the long labour, the arduous accomplishment of which has occupied my whole life. My career began in hardship; I knew bitter misery and despair. Later on I lived a life of battle, I live it still; disparaged, scoffed at, covered with insults! Well, through all of this I have had but one faith, one fortifier—work. That which has sustained me has been the huge labour I imposed upon myself. Yonder, in front of me, I always beheld the goal toward which I was marching; and this it was—whenever the ills of life had laid me low—that sufficed to set me on my legs again and gave me the courage to march on and on, despite everything.

A NEVER-FAILING CONSOLATION.

The work I refer to is steady, settled work, the daily task, the self-imposed duty of making a forward step every day towards the accomplishment of one's allotted toil. How many times of a morning have I sat down at my table, with my head in confusion, lost, my mouth bitter, tortured by some great physical or moral anguish! And on each occasion, despite the rebellion of my sufferings, my task—after the first minutes of agony—brought me relief and comfort. I have invariably risen up from my daily toil with a feeling of consolation—my heart yet sore, perhaps, but nevertheless conscious that I was still erect, with strength enough to continue living until the morrow.

LABOUR, THE LAW OF LIFE.

Labour! remember that it is the unique natural law of the world, the regulator which leads organised matter to its unknown goal. Life has no other meaning, no other *raison d'être*; we only appear on this earth in order that we each may contribute our share of labour and disappear.

As soon as that task has been accepted, as soon as the accomplishment of it begins, quietude, it seems to me, must descend into the hearts of those that experience the greatest torture. There are some minds, I know, that are tormented by thoughts of the Infinite, the Mysterious, and to them I fraternally address myself, advising them to occupy their lives with some huge labour, the end of which it might be well they should never see. This is the balancing pole that will enable them to proceed on their way upright, without fear of falling, the diversion that will provide solace for every weary hour, the grain of wheat tendered to the mind that it may grind it for its daily sustenance with the satisfaction that attends upon the performance of duty. Doubtless this does not resolve any metaphysical problem; in what I have said there is but an empirical recipe for living life honestly and in tolerable quietude.

SOCIALISM THE GREAT LAW OF TO-MORROW.

Cannot you already see outlined in the rise and growth of Socialism, the one great law of to-morrow, the law of labour for all—liberating and pacifying toil? So, young men, young men, set yourselves to work. Let each of you accept his task, a task to fill his life. It may be a very humble one, but it will none the less be useful. Let it be what you please, provided that it is *there*, and that it keeps you erect!

FRENCH AGGRESSION ON SIAM.

THERE are many articles on the Siam Frontier Dispute in the July magazines, but they all sound the same note.

In the *Contemporary Review* Mr. Henry Norman writes on the "Future of Siam." The article is brightly written, and based upon the result of his own observation. Mr. Norman is quite sure that Siam could not offer any resistance worth naming to any European force. Like everybody else who writes upon the subject in this month's magazines, Mr. Norman is in favour of intervention to protect Siam against her aggressive neighbour:—

We are the great power in the whole East, and we must remain so. For the sake of peace and security for our present possessions, and for the sake of our future market, we must not allow Siam to be absorbed by France. If to prevent this it is necessary to "protect" Siam, we must be prepared to do so. Speaking for myself, though the attitude may be an unpopular one, I hold as an Imperialist and a believer in Englishmen above all other men, and in British rule above all other rule, that we should be justified in assuming charge of Siam for no other reason than to prevent France doing so. But of course we must be sure of her intention first. Our forefathers twice prevented her from founding a rival empire; we should not be less determined.

In the *Nineteenth Century* the Hon. G. N. Curzon has an article on this question which he illustrates admirably with a map displaying the successive advance of the French frontier on the successful maps in 1866, 1887, and 1892. Mr. Curzon thinks that we ought to say "Hands off" to the French. He says:—

The proximity of Siam to our Indian dominions, the millions of British capital that are sunk in the country, and the enormous preponderance of British political and commercial interests—as compared with the total absence of any corresponding French qualifications—render it impossible, therefore, for any British Government to acquiesce in further and more serious assaults upon Siamese territorial integrity, or in the institution of a rival and hostile European influence at Bangkok.

No English Government could afford to sit still while the French established themselves, at leisure and in succession, in the Cis-Mekong districts, on the Central Siamese plateau, in the valleys of the Menam and the Meping. Of this our neighbours should be apprised in full time.

In the *National Review* Mr. R. S. Gundry, writing on "France, England, and Siam," sets forth the cause at issue between the Powers, and insists that—

Nothing could be fairer than the Siamese proposal that both sides should bring forward proofs in support of their respective claims, and that resort should be had to arbitration in case of inability to agree; and the French Government would be well advised to accept it. The relegation of the question to diplomacy would not only give opportunity for a settlement that would be less reluctant of aggression, but would open the door of a revision of M. Ribot's claims on the Upper Mekong, where England would not only view with jealousy any encroachment on Luang Prabang, but would certainly resent the annexation of territory that she has herself just ceded to Siam.

In the *Asiatic Quarterly* there are two papers dealing with French designs on the borders of Siam. The writer of the article upon France and Siam is a resident in the latter country, who strongly objects to the action of the French, and urges that we should do what we can to prevent Siam becoming a prey to French ambition.

England has no desire or intention either now or at any future time to annex Siam; but our interests, both political and commercial, require that the independence of the country shall be upheld. Commercially, any tampering with the kingdom by France will mean the certain loss to this country of a valuable and rapidly increasing trade; and politically, since the occupation of the country by France would make our boundaries co-terminous, and result in constant friction, besides adding largely to the expenses of administering Burmah.

MR. ROBERT LOUIS STEVENSON.

SOME POPULAR AUTHORS AND THEIR BOOKS.

DAUDET, HOWELLS, STEVENSON, HIGGINSON, MISS DICKENS, ZANGWILL, ETC.

THE chief feature of the lighter magazines this month is papers describing popular authors and their books. For convenience sake I string together the notices of these articles.

ALPHONSE DAUDET.

The brightest and most readable of the series is the charming account of M. and Madame Alphonse Daudet, which Miss Belloc contributes to the *Idler*. It is part sketch, part interview, and gives a very pleasant picture of the great French novelist and his wife.

One of the most charming characteristics of Alphonse Daudet is his love for, and pride in, his wife. He says, "All that is best in my literary work is owing to her influence and suggestion. There are whole realms of human nature which we men cannot explore. We have not eyes to see, nor hearts to understand, certain subtle things which a woman perceives at once; yes, women have a mission to fulfil in the literature of to-day."

His handwriting is clear, and somewhat feminine in form, and he always uses a steel pen. Till his health broke down he wrote every word of his manuscripts himself, but of late he has been obliged to dictate to his wife and two secretaries; re-writing, however, much of his work in the margin of the manuscript, and also adding to and polishing each chapter in proof.

Daudet's novels are really human documents, for from early youth he has put down from day to day, almost from hour to hour, all that he has seen, heard, and done. He calls his note-books "my memory." When about to start a new novel he draws out a general plan, then he copies out all the incidents from his note-books which he thinks will be of value to him for the story. The next step is to make out a rough list of chapters, and then, with infinite care, and constant corrections, he begins writing out the book, submitting each page to his wife's criticism, and discussing with her the working out of every incident, and the arrangement of every episode.

His own favourite dramatist and writer is Shakespeare, whom, however, he only knows by translation, and Hamlet and Desdemona are his favourite hero and heroine in the fiction of the world, although he considered Balzac his literary master.

How Daudet began life as a poet, then blossomed into a dramatist, and afterwards served four years as one of the Duc de Morny's secretaries—for all this and much besides of interest and instruction I must refer the reader to the article. But one more extract I must give. Speaking of the war year, 1870-1, Daudet told Miss Belloc:—

"That terrible year taught me many things. It was then for the first time that I learned to appreciate our workpeople, *le peuple*. Had it not been for what I then went through, one whole side of good human nature would have been shut to me. The *Paris courier* is a splendid fellow, and among my best friends I reckon some of those who fought by my side in 1870."

I. ZANGWILL.

Mr. Zangwill, in the same magazine, tells the story of his first book. The humour is rather forced, but the tale is not without interest. Mr. Zangwill began to write stories when he was ten, and when he was in his teens gained a prize for a tale which appeared in *Society*. He stands aghast at the quantity of rubbish he turned out in his seventeenth and eighteenth years, in the scanty leisure of a harassed pupil-teacher at an elementary school, working hard in the evenings for a degree at the London University to boot. His first serious effort was a

story, "The Premier and the Painter;" but his first literary success was "The Children of the Ghetto." After it appeared all seems to have gone smoothly. He thus sums up his own experience by way of advising literary aspirants:—

But the best I can find is this: That if you are blessed with some talent, a great deal of industry, and an amount of conceit mighty enough to enable you to disregard superiors, equals and critics, as well as the fancied demands of the public, it is possible, without friends, or introductions, or bothering celebrities to read your manuscripts, or cultivating the camp of the log-rollers, to attain, by dint of slaving day and night for years during the flower of your youth, to a fame infinitely less wide-spread than a prize-fighter's, and a pecuniary position which you might with far less trouble have been born to.

EMILIA BAZAN.

Under the title, "The First Woman in Spain," Sylvester Baxter, in the *Cosmopolitan* for June, writes a very appreciative notice of his friend Emilia Pardo Bazan, the Spanish novelist. After describing her childhood and her first literary attempt, he tells us the following story of the origin of one of her most famous novels:—

"La Tribuna" was suggested by the sight of dozens of groups of operatives from the great cigar factory in La Coruña on their way homeward at close of day. "Can there be anything like a novel beneath those calico gowns and frayed mantles?" she asked herself. "Yes," her instinct responded, "wherever there are four thousand women, there are certainly four thousand novels; the thing is to find them out." Then she recollected that those women, dark, strong and, resolute in bearing, had been the most ardent partisans of the federal idea in the revolutionary years, and she felt a curiosity to study the development of a political idea in woman's brain.

For two months she visited the factory morning and afternoon, listening to conversations, delineating types, hunting for phrases and modes of thought. She obtained local newspapers of the federal epoch, evoked recollections, described the Coruña of her childhood, and reconstructed the days of the famous compact. She did not make the slightest attempt at satire, and she even endeavoured to diminish her humorous effects.

An aristocrat by birth, Señora Bazan is evidently democratic by nature; made so by her broad and keen sympathies, aroused by her observations in circles of life foreign to her class. No socialist could put it stronger than the following: "The genuine social inferno into which the novelist may descend, the modern Dante who writes cantos of the *Comedia Humana*, is the factory; and the most condemned of the condemned, that being who is converted into a wheel, a cylinder, an automaton."

W. D. HOWELLS.

McClure's Magazine for June makes an attempt to substitute real conversations for the interview. The victim selected for the first attempt is Mr. W. D. Howells, his interlocutor being H. H. Boyesen. It can hardly be said to be a success. Mr. Boyesen does not know how to interview, and he attempts to make up for his lack of art by laying on flattery with a trowel. From the remarks made by Mr. Howells I take the following items:—

I had always a passion for literature, and to a boy with a mind and a desire to learn a printing office is not a bad school. I was nineteen years old when I went to the capital and wrote legislative reports for Cincinnati and Cleveland papers; afterwards I became one of the editors of the *Ohio State Journal*. My duties gradually took a wide range, and I edited the literary column and wrote many of the leading articles. Then I wrote a poem for the *Atlantic*, which pleased Lowell, pub-

lished some verse, and was appointed to a Consulate in Italy. At first I was going to the Consulate at Rome; but as it depended entirely upon perquisites, which amounted only to three or four hundred dollars a year, I declined it, and they gave me Venice. The salary was raised to fifteen hundred dollars, which seemed to me quite beyond the dreams of avarice. My Venetian experience gave me four years of almost uninterrupted leisure for study and literary work. There was, to be sure, occasionally an invoice to be verified, but that did not take much time. Secondly, it gave me a wider outlook. Thirdly, I learned German and Italian. From the day I arrived in Venice I kept a journal, in which I noted down my impressions. I found a young pleasure in registering my sensations at the sight of notable things, and literary reminiscences usually shimmered through my observations. Then I received an offer from the *Boston Daily Advertiser* to write weekly or bi-weekly letters, for which they paid me five dollars, in greenbacks, a column, nonpareil.

Mr. Howells goes on to tell how his first story was refused by publisher after publisher, but when published at last achieved an immediate success. He says that he prefers of all his works "A Modern Instance."

"Silas Lapham" is the most successful novel I have published, except "A Hazard of New Fortunes," which has sold nearly twice as many copies as any of the rest.

MISS MARY DICKENS.

Miss Dickens is described in the *Young Woman* for July. She is the granddaughter of Charles Dickens. Her novels, "Cross Currents" and "A Mere Cypher," give promise that the grandfather's genius is developing in his descendant. The interviewer says:—

Of full height, rather slim, with large thoughtful eyes set in a refined intellectual face, Miss Dickens is altogether a bright, unaffected young lady, whose chief charm is her naturalness. She has never lost her girlishness, though when looking at you sternly through her *pince-nez* she is more formidable. She is naturally pleased with the reception given to her books, and frankly showed it; but success has in no way spoiled her. When I asked her how she came to be a writer, she replied, with a light laugh, that she hardly knew. "I never should have thought of writing at all," she told me, "if it were not that I have a friend who makes story-writing her profession. I had been in the habit of criticising her work for years, and in this way I gradually acquired a familiarity with the technique of the art which eventually suggested to me the idea of writing a story on my own account." She mentioned that at first she felt very shy of putting anything in the shape of thought into print. "My first book was quite dreadful to me. I felt as I should imagine a snail might feel if he should find himself suddenly separated for ever from his shell! It was silly, of course, and one gets hardened; but even now I cannot sit still and see any one reading a story of mine. It makes me wretched."

"Have you any particular methods of work?"

"I write six hours a day—three in the morning, three in the afternoon. As to waiting until the spirit moves me," she went on merrily, "if I did that, I might never sit down to work at all. But I must own that it is not pleasant to get up after having written three lines in three hours, and then perhaps to cross those three lines out in the afternoon." Miss Dickens works in a little room at the top of the tall house, and her window commands a fine view of the Park.

R. LOUIS STEVENSON.

The character sketch in the *Young Man* for July is Rev. W. J. Dawson's study of Robert Louis Stevenson. Mr. Dawson, speaking of Stevenson's early days, says:—

From earliest boyhood he admits the tendency to write, but with him it was never a casual indulgence, nor was the achievement of his style a fortunate discovery. In those old Edinburgh student days which he so perfectly depicted, he was to the academic eye a mere idler, at ending as few classes as he possibly could, and wholly without thirst for

academic honour. When he presented himself for a certificate in the engineering class, Professor Fleming Jenkin, whose life he was afterwards to write, said, "It is quite useless for you to come, Mr. Stevenson. There may be doubtful cases: there is no doubt about yours. You have simply not attended my class."

Speaking of one great element of his charm, Mr. Dawson says:—

Mr. Stevenson has three great interests in life: the first is himself, the second his fellow-man, and the third Nature. In his power of minute self-revelation he resembles Montaigne. His candour is perfect, and whatever he writes he unconsciously succeeds in projecting some lovable, or at least fascinating, image of himself across the page.

T. W. HIGGINSON.

In the *Literary Northwest* for June Miss Mary J. Reid has a very interesting article upon "Thomas Wentworth Higginson," illustrated by his portrait and an autograph. Miss Reid says:—

Physically, our author is tall and broad-shouldered, carrying all of his six feet in his erect and soldierly bearing. His eyes are blue, his complexion is ruddy and healthful, and his hair is brown, flecked with gray. His voice is clear and well-modulated, his manner genial, and he possesses much social tact. In a mixed company Higginson soon gets the ear of the room, and knows how to adapt himself to the capacities and idiosyncrasies of others. On the platform he is a ready yet finished speaker, realising one's ideal of oratory more nearly than any other living American. As he always begins his speeches in a conversational tone, a novice might be disappointed in him; not understanding the art that conceals art. As a presiding officer he is unequalled, having a profound knowledge of parliamentary rules and an infinite amount of tact. Being quick at repartee, his admirers claim that he is one of the best after-dinner speakers at the East, his only rival in that respect being Hon. Chauncey Depew. In politics he is a "Mugwump."

An Example for Our Women from Chicago.

MR. JULIAN RALPH writes a paper in *Harper's Magazine* upon "Chicago's Gentle Side." He gives the following account of the kind of work done by the Chicago Protective Agency for Women:—

Five mistresses of disorderly resorts had brought as many young girls to Mrs. Logan, and had said they wanted them saved. The girls were pure, but had been brought to the houses in question by men who had pretended that they were taking them to restaurants or respectable dwellings. The Agency caused the arrest of the men implicated; and when the first case came up for trial, the Agency sent for fourteen or sixteen married women of fine social position to come to court and sit through the trial to see fair play. When the baigno-keeper, who was the chief witness against the prisoner, took the stand, she testified that the girl had been told that her house was a restaurant where she was to have supper. Undeceived, she was greatly frightened, and the woman took charge of her. Then the counsel for the defence began to draw out the story of the woman's evil life and habits. He was rebuked from the Bench, and was told that the woman's character for chastity could not affect her testimony, and that when counsel asked such questions of women witnesses the Court would insist that similar questions be put to all male witnesses in each case, with the same intent to destroy the force of their depositions. Thus was established a new principle in criminal practice. In the other cases prosecuted by the Agency the same array of matrons in silks, laces, and jewels was conspicuous in the court-rooms. The police and court officials are said to have been astonished at this proceeding by women of their standing. But the women have not only gained a step towards perfect justice for their sex, they say that their presence in court has put an end to the ribaldry that was always a feature of trials of the kind. Not far removed from this work has been the successful effort of the women to raise what is called "the age of consent" from twelve to sixteen years.

FRITZ VON UHDE.

SOME of us still remember a very striking picture which was recently exhibited at the new gallery in Grafton Street; yet it evidently did not succeed in attracting such universal attention as would ensure its being reproduced in any of the handbooks to the "Pictures of the Year." The picture referred to is Fritz von Uhde's "Lord, Abide With Us," in which the disciples who met Christ on the road to Emmaus and Christ Himself were painted in the ordinary costume of nineteenth century workmen. Very little seems known about the artist who has dared to lend such reality to Christ and His teaching by depicting Him amid

FRITZ VON UHDE.

present-day surroundings; therefore the following notes respecting his career are not without interest. They are taken from Heft 19 of the *Universum* and from a short study by Otto Feld in the June number of *Nord und Süd*.

Fritz von Uhde, says his critic, is an artist and a painter who reads the Bible story and contemplates the world; his soul is filled with an all-pitying love for mankind, and it is this same love which he discerns in nature and in toiling humanity, and reproduces in his pictures.

The evening bells are heard across the fields; a gentle expression steals over the faces of the peasants; they lend the knee; their hearts are full, and they are weighed down with fatigue. At this moment a wanderer comes up to them, and whispers soft consoling words to them. Again, a group of children are playing in a poor room; a man with gentleness and love in his eyes goes in; the little hearts fly to him and trustingly crowd round his knee, staring innocently while the kind words flow from his lips. This is "Suffer Little Children."

Few artists, however, have experienced so much varied criticism as Uhde. Some have lauded his religious pictures as works of the highest epoch-making significance; others have condemned them just as roundly. In modern painting they are certainly something thoroughly new, representing Christ and New Testament events as present-day actualities. Yet in other periods of art history

the same things have happened before. Nearly all the artists of the Italian Renaissance, for instance, painted Biblical occurrences as events of the Italian life of the time. Similarly, Dürer gives us the Nürnberg of his day, and Rembrandt the Netherlands of his time.

Uhde was born in May, 1844 (or 1848?), at Wolkensburg, in Saxony. After spending some time at the Academy of Art at Dresden, he seems to have been disgusted with his progress, and so gave up art in 1867 to enter the Saxon regiment of mounted guards, and as officer took part in the French campaign of 1870-71. In 1877, however, he put off his military uniform to go back to art, studying the Dutch masters of the seventeenth century at Munich, and in 1879 going to Paris, where he worked some time in the studio of Munkacsy. In 1882 he returned to Munich, then set out for Holland in the same year, the fruits of his sojourn in that country being a series of studies and impressions of Dutch life.

Meanwhile, the Germans were shaking their heads in doubt over Uhde's work; but it was not till 1884 that the real storm of rage and adverse criticism broke forth. This was *à propos* of his first Biblical picture, "Suffer Little Children," in which no attempt whatever is made at beauty of form, simple, honest truth rather being made to speak more forcibly than any conventional beauty.

The master has indeed made a deep study of the pious legends, and has rescued from the Gospel that which is ever human. Stripped of all dogma, he soars in the sphere of pure humanity, so that the great teacher who practised and preached love for mankind goes to the children and to the poor and oppressed, breaking bread for the disciples in "The Disciples at Emmaus;" entering the poor hut when the family are asking a blessing, and sitting down to the simple meal with them in "Come, Lord Jesus, and Be Our Guest;" and preaching in the open to the devout country folk in "The Sermon on the Mount." A mighty step forward is "The Lord's Supper," which, according to a French critic, should have been entitled "Comment se fondent les religions;" but those who would fathom all the riches of the artist's soul should not fail to turn to his "Holy Night."

Most of Uhde's pictures seem to have gone into the hands of private individuals outside Germany, but the following list of the Biblical subjects already treated may be regarded as fairly complete:—

- "Suffer Little Children." 1884. Leipzig Museum.
- "The Disciples at Emmaus." 1884. Museum at Frankfurt-on-the-Main.
- "Come, Lord Jesus, and be our Guest." 1885. Berlin National Gallery.
- "The Sermon on the Mount." 1886-7.
- "The Holy Night." 1887.
- "The Birth of Christ." 1889. Dresden Gallery.
- "The Lord's Supper." 1890.
- "The Journey to Bethlehem." 1890. Pinakothek, Munich.
- "The Women returning from the Sepulchre." 1890.
- "Morning." 1890.
- "The Flight into Egypt." 1891.
- "Bringing the News to the Shepherds." 1892.
- "Lord, Abide with Us." 1892.
- "Easter Morning." 1892.
- "The Journey to Emmaus." 1892.
- "Christ among the Work-People." Luxembourg, Paris.

In the *Theosophist* for June, Colonel H. S. Olcott contributes the fifteenth chapter of his "Old Diary Leaves," in which he makes many extraordinary statements as to the way in which Madame Blavatsky wrote "Isis Unveiled." I reprint them in *Borderland*.

THE DECADENCE OF ART.

By MR. FRED. HARRISON AND MR. QUILTER.

MR. FREDERIC HARRISON, who recently discoursed concerning the decline and fall of British romance, is now turning his attention in the same mournful mood to modern art. In the *Forum* for June Mr. Harrison says that he finds numerous illustrations of the decadence of art in many places.

THE CULT OF THE DISGUSTING.

Among other instances, he calls attention to the love of reproducing objects which simply disgusts him.

One rarely sees an exhibition of pictures now, especially in France, without plenty of literal transcripts from hospitals, police cells, and dens of infamy. A powerful imagination might find art even there. But the aim of these modern "artists" is not art—but disgust. They give us mere coloured photographs, without grace, pathos, awe, life, or invention. Their purpose is to be as ugly, as crude, as photographic, as unpleasant as canvas and dull paint can make it. It is not even grim; it is not sensational; it is not a *tour de force*. Everything is flat, angular, prosaic, nasty. Few persons have witnessed the operation of ovariectomy, or a lesson in anatomy, or a drunken orgy in a night-house. To give a literal rendering of one of such scenes ministers in some to a prurient curiosity. And the artist has his reward in the grinning groups around his work. But it is no more art than is the report of a filthy trial, or the descriptions in a manual of surgery.

THE THEORY OF THE UGLY SCHOOL.

Strange though it may seem, this practice is by no means confined to the worst of contemporary artists:—

We cannot shut our eyes to the fact that men of true gift and trained skill are dragging down their Art into the mire; and it is time to weigh their claims and their theories. For it concerns more than Art. Like every other claim to degrade human life, it has a moral and a social side which concerns us all.

I deduced to its elements, their theory is this:—

"Art means the representation of Nature. Whatever is found in Nature is the subject of Art. The test of Art is success in representation: nothing else at all. The business of the artist is to show how cleverly he can use his brush. It matters not what he paints, if it enables him to display dexterity. You, the spectator, must not think about the painting—the one thing to be thought of is the painter. You may not like the result of his work: you may find it as a picture, tedious, revolting, grotesque. So much the worse for you. The painter *sees* that: the painter *enjoys* that dull or foul scene; the painter *once so* that queer combination. It is no business of yours that it does not interest you. Your business is to see how very cleverly he has put on to canvas this filth or this dullness. If you cannot see it, you are a rank Philistine, and had better buy oleographs evermore. Art has been ruined by its silly straining after the beautiful, the ideal, the charming, and the ennobling. There is in Nature quite as much that is coarse, dull, odd, and foul—perhaps much more—and it is far more obvious and intelligible. Art henceforth means the realism of the seamy side of Nature and Man. We have been surfeited by the pursuit of grace, beauty, and dignity, which have led Art into a world of sickly conventions. We are now in for naturalism in its real, crude, naked shape. If *technique* is right, all is right. The one test of Art is—*du Chic, du Chic, encore du Chic!*"

These are the Ten Commandments of the Ugly School. And we may say at once that Art has never before been endangered by a creed at once so false and so base. It is the product of conceit in the artist, stimulated by the demoralising system of public Exhibitions filled by competition, in an age when social principles are being cast pell-mell into the melting-pot.

IS ART INSPIRATION WORN OUT?

Against this doctrine Mr. Harrison raises his voice in eloquent protest. He says:—

There never was, and there never will be, any epoch of great Art which had not its own religious, social, or national enthusiasm, its recognised ideals of beauty and happiness, its sense that the duty of Art was to minister to a nobler life. It will be an evil day when Art comes to mean individual caprice, and the artist means a clever tradesman scheming to get business—when the ideal of beauty is displaced by feats of manual dexterity. It is but too obvious that nearly all that which served to inspire great Art in past times is now worn out. But to preach to us that Art needs no inspiration, no ideals, no guidance, no thought, no beauty, no self-control—that its sole task is to put on canvas whatever is to be seen—this is the broad road that leadeth to destruction.

THE TRUE PATH.

Mr. Harrison is not content merely to protest; he thinks he sees the true path in which all artists must work if art is to be saved. In some modern painters he thinks he can recognise hopeful signs.

Especially is that true of those poetic efforts to combine fact, beauty, pathos, and reality in the aspect of common things and lowly lives—which may be said to culminate in the *Angelus*. Here is the true path. But amongst these new groups, raging to be "original," both here and in France, there are some to whom beauty—nobleness of aspect or of feeling—even decency—are a mockery and an offence; some whose ideal it is to be dull, or to be eccentric, or to be brutal. For such there is no hope in this world or the next.

WHAT MR. QUILTER THINKS.

Mr. Harry Quilter in the *English Illustrated Magazine* discusses upon a similar subject, but he has ideas of his own as to the cause of the mischief and its remedy. Judging from Mr. Quilter's paper, one of the greatest evils which assail art at the present day is the popularity of illustrated journalism. Newspapers pay so well that the rising artists are tempted to devote themselves to ephemeral work.

THE CURSE OF ILLUSTRATIONS.

Mr. Quilter says:—

I who write have seen in England the rise and growth of illustrated journalism, from the old days when there was provided for the delectation of the æsthetic public only the *Illustrated London News* and its "Police" namesake, to these present days of *Daily Graphics* and *Pick-me-ups* and the *Picture Magazine*; and I have no hesitation in saying that the effect of this enormous development has been far more injurious than beneficial to the finest qualities of English art. Whether it has not been as strongly injurious to English life is a question of graver importance, and one which cannot be debated here, but there can be little doubt but that the baser sort of society journalism, which probably does more harm than any other social influence of the day, walks hand in hand with these Anglo-French illustrations which are becoming daily more common. We have not yet, it is true, the absolute equivalent of *La Vie Parisienne* produced in London, but there are one or two journals of essentially the same type, and which appear to be day by day feeling their way gradually to the attainment of that paper's special ideal.

WHAT SHOULD BE DONE.

To check the decay which is going on all round, Mr. Quilter insists that—

If we would have a great art we must encourage less the art that is *only made for destruction, which is, of its very nature, temporary and evanescent*. And to do this we must render the prizes of the first commensurate with the importance of the object, and such as can be utilised to help all those who choose the higher service.

There are many ways of effecting the last-mentioned object, of which one of the simplest would be the institution

of competitions for great decorative designs in both painting and sculpture, at certain fixed seasons. A preliminary series of designs should be sent in to the judges, and from these a certain number selected. Their producers should be assisted to defray the expense of models, studio, etc., necessary to the completion of the finished work. The finally successful competitor should have his work purchased by the nation at an adequate, but not extravagant price, and should further be allowed the privilege of exhibiting as a matter of right for three or more successive years at the Royal Academy. The unsuccessful designs should become the property of the nation in such cases as those in which the nation had paid for their production, and might easily be utilised in principal art schools, galleries and museums. I believe if such a competition were instituted twice yearly, two months being given for the preparation and judgment of the first designs, and four for the execution of the work, a great improvement would be effected.

THE PENURY OF THE MODERN ARTIST.

Mr. Quilter closes his article by describing with much feeling the miserable condition of the modern artist. It seems there are 10,000 persons mentioned as artists in "The Year's Art"; there are probably twice as many who are devoted to the brush, yet only one picture in ten of those exhibited in the galleries is sold. Mr. Quilter says:—

Many of these boys of ours, and those the best, the least advertising, and most high-minded, are literally starving; and starving, mind, with that most bitter of all thoughts, that there is for the best kind of work they try to do no recognition and no reward. These are not sentimental or hasty words, nor are they written by one who is ignorant of this subject. I have been for many years behind the scenes of the unfashionable artist world. I have seen the shoe pinch—seen it sometimes drive my near friends to desperation and madness. It would be everything to the men who are working honestly and unknown if they could feel there was a bi-yearly tribunal to which they might send their work in projection, and which would, if the work were deserving, aid its completion; nay, even the permission to show it to impartial judges, would save many from that morbid self-concentrated despair which is the artist's greatest suffering.

The Paderewski Mania.

MR. HENRY T. FINCK, in the *Forum*, gives an interesting account of the immense mania which prevails in America over the pianist Paderewski. Paderewski is probably the only musician who has made £36,000 in a single season. Mr. Finck says:—

The receipts averaged about five thousand dollars, and the pianist's earnings from about seventy concerts in twenty-six American cities this season exceed \$180,000—a sum never before reached by any instrumental performer and rarely equalled by a favourite prima donna in the palmiest days of the *bel canto*. To some of the concerts in Western cities, extra Paderewski trains were run from neighbouring towns, and another curiosity was a special concert for the young lady students of Smith College, for which the authorities spent twelve hundred dollars.

It is interesting to compare Rubinstein's net earnings in 1872—fifty thousand dollars for two hundred and fifteen concerts. For the number of concerts given he earned nine times as much as Rubinstein. Yet even this sum cannot tempt the Polish pianist to return next year. He longs to compose rather than to play. Six months of concert-giving, with half the nights spent sleepless on Pullman cars, brought on nervous prostration last year, and came near doing it again this year, in spite of his youthful age (thirty-three) and his strong constitution; for he is a much stronger man than he looks, being muscular and wiry, and weighing one hundred and forty pounds.

Our full purses and ready enthusiasm for what is greatest of its kind, combined with our "magnificent distances," make America at once the Eldorado and the terror of artists.

HOW NONCON. STUDENTS ARE TRAINED.

BY PRINCIPAL REYNOLDS.

IN the *Quiver* Mr. Raymond Blathwayt publishes an interview with Principal Reynolds, of Cheshunt College. The following extract from Dr. Reynolds' remarks may be read with interest by those outside the Congregational body, who wish to know how one of the leading Nonconformist denominations trains its students for the Ministry. Dr. Reynolds said:—

They know comparatively little of the old Puritans, and I should say that they are very much influenced by modern thought. They, of course, read along the lines of study we indicate to them, taking up very carefully the long-ago preparation in eastern and western heathendom for the conception of "The Word made Flesh;" the Christology of the Old Testament; the Alexandrine Gnosis; the special teachings of the Four Gospels; our Lord's testimony of Himself; and the theological conceptions deducible therefrom: but on this they graft their own study of modern theology. "Lux Mundi," for instance, greatly interested them; and almost all of them have read Drummond's "Natural Law," although I do not suppose many of them could criticise it very ably. I myself, at this time of day, am naturally rather conservative; still, I like these young men to think matters out for themselves as much as possible. I have elaborated a rather comprehensive plan of theology, which I am gradually opening up to my classes. I am dealing a good deal with comparative religion, the relation of Christianity to philosophy and theology, starting from Christology and thence to theology. I teach them that the Incarnation is the great centre, and how it presses on conscience and heart. I take up the doctrine of the Godhead, and here I instruct them in "Vanooosterzee," Ellieott's "Being of God," and in "Dorner." I advise them in their exegesis and general theology to take up the great books, and to regard theology equally from the biblical, the philosophical, and the historical point of view, tracing it all up from the Scriptures to the present day.

And now as to the controversial side of the question, so necessary in the present day?

Well, they have a three years' course in philosophy, psychology, history, dogma, and ethics. They are specially instructed in the points of agnostic and infidel controversy; they are advised where to concede and where to hold fast. Another thing that I believe in strongly as being of great benefit for these young men is the delivery of homiletic lectures on preaching. We begin with elocution. We tear these men to pieces at first; their delivery, their logic, their grammar. I devote special pains to teaching them the proper use and the mode of employing illustrations in their sermons. It is difficult for a young man to know what he means by establishing a fact. He can state it readily enough, but to prove it is altogether another matter. I employ the Socratic method. They learn here that first they must know what they are going to say, then how to begin; they are assured of the homiletic motive; they are taught the method of description; they learn how and when to end—always a difficult thing for young men. They lack pathos strangely. Most of them are afraid of their own emotions; they don't like to let themselves go. Some, on the other hand, are all emotion. The pathetic and the argumentative are exceedingly difficult to teach.

How to Live for 200 Years.

ANY of our readers who wish to protract their existence in their present bodies for two centuries, may be interested in knowing that in the *North American Review* for June Mr. William Kinnear tells them how to do so. Here is the prescription:—

The most rational modes of keeping physical decay or deterioration at bay, and thus retarding the approach of old age, are avoiding all foods rich in the earth salts, using much fruit, especially juicy, uncooked apples, and by taking daily two or three tumblerfuls of distilled water with about ten or fifteen drops of diluted phosphoric acid in each glassful.

ON THE EDGE OF THE FUTURE.

PROBLEMS IN STEAM AND ELECTRICITY.

In the *Engineering Review* for June, Professor Thurston, writing on "Progress in Steam Engineering," thus describes the problems which still await solution at the hands of the engineer:—

WORK FOR THE ENGINEER.

The problems remaining to be solved are such as these: securing fuel of minimum volume and weight with maximum heat-producing power; making boilers safe for still higher pressures; extending still more widely the range of thermodynamic transformation of the thermal into dynamic energy; reducing still further, and greatly, the wastes of the engine, especially its internal heat-wastes; and concentrating the mighty power of steam into even less compass and weight. Liquid fuels give about twice as much power as the coals, per pound and per cubic foot; boilers composed of many small chambers give greater safety, both from explosion and in case of explosion at high pressure; increased pressures, with further multiplication of engine-cylinders, promise further economy, and superheating the steam, should this ever be found permanently and safely practicable, gives perhaps even greater promise in this direction; the better kinds of iron and especially of construction-steels, the new alloys constantly coming into sight, and the more skilful use of materials by the designer, are conspiring to give further concentration of power, both in weight and space; and there seems to be no reason to doubt that the immediate future holds out promise of continued, perhaps of still accelerated, advances in all these directions.

WHAT HE HAS ALREADY ACCOMPLISHED.

For the moment, at least, the advances of the century have brought us to the construction of steam-engines light enough to compete successfully with the motive organs of the birds; others economical enough to give us a horse-power for an hour with every twenty ounces of fuel burned in their boilers, and to carry a ton a mile, at sea, on the expenditure of a half ounce of coal; quick enough in their rotation to accompany the spinning armature of the dynamo-electric machine and to drive their dispersing energy over miles of wire, to give light or power to distant buildings or to cars loaded with a hundred passengers. The culmination of human ingenuity and skill seems to be presented in the new ocean steamers.

Should this progress culminate in the discovery of methods of direct conversion of the energy of chemical forces into mechanical power without those enormous thermodynamic losses now apparently absolutely inevitable between our coal beds and our various machinery, our own times will very probably stand to those of future ages as, in respect to intellectual development, the days of the ancient Greeks stand to later times.

FLYING BY ELECTRICITY.

In *McClure's Magazine* for June, Mr. C. Moffett publishes an interview with Professor Graham Bell, from which I quote more at length in *Borderland*. Professor Bell says:—

I have not the shadow of a doubt that the problem of aerial navigation will be solved within ten years. That means an entire revolution in the world's methods of transportation and of making war. Electricity in one form or another will undoubtedly be the motive power for air-ships, and every advance in electrical knowledge brings us one step nearer to the day when we shall fly. It would be perfectly possible, to-day, to direct a flying machine by electricity.

SEEING BY ELECTRICITY.

Scientists are agreed that there is no theoretical reason why the well-known principles of light should not be applied in the same way that the principles of sound have been applied in the telephone, and thus allow us to see at a distance by electricity. It is merely a question of finding a diaphragm which will be sufficiently sensitive to receive the vibrations and produce the corresponding electrical variations of light.

THINKING AND HEARING BY ELECTRICITY.

Professor Graham Bell then said that the time is coming when thought will be transmitted electrically without wires or speech—as indeed it is done now every time a telepathic communication is received. He held forth hopes that before long the deaf will be made to hear and the blind to see by the same brain-tickling capacity of this universal agent.

WHAT EDISON IS AFTER NOW.

TWO NEW INVENTIONS—IRON AND COAL.

In *McClure's Magazine* for June Mr. E. J. Edwards gives a very interesting account of the problems which Mr. Edison is now attempting to solve. If he succeeds he will revolutionise the iron and coal trade.

AN ORE CONCENTRATOR.

Mr. Edison's most important campaign, according to his own account, upon which he has been engaged for several years, is the invention of an ore concentrator for cheapening the process of extracting iron from earth and rock. Of ten important details necessary for success he has mastered eight.

When the machinery is done as I expect to develop it, it will be capable of handling twenty thousand tons of ore a day with two shifts of men, five in a shift. That is to say, ten workmen, working twenty hours a day in the aggregate, will be able to take this ore, crush it, reduce the iron to cement-like proportions, extract it from the rock and earth, and make it into bricklets of pure iron, and do it so cheaply that it will command the market for magnetic iron.

A COAL CONVERTER.

After this iron-ore concentrator is finished, Mr. Edison said:—

I shall turn my attention to one of the greatest problems that I have ever thought of solving, and that is—the direct control of the energy which is stored up in coal, so that it may be employed without waste and at a very small margin of cost. Ninety per cent. of the energy that exists in coal is now lost in converting it into power.

If this waste were saved—

It would enable an ocean steamship of twenty thousand horse-power to cross the ocean faster than any of the crack vessels now do, and require the burning of only two hundred and fifty tons of coal instead of three thousand, which are now required; so that, of course, the charges for freight and passenger fares would be greatly reduced. It would enormously lessen the cost of manufacturing and of traffic. It would develop the electric current directly from coal, so that the cost of steam-engines and boilers would be eliminated. I have thought of this problem very much. The coal would be put into a receptacle, the agencies then applied which would develop its energy and save it all, and through this energy electric power of any degree desired could be furnished. Yes, it can be done; I am sure of that. Some of the details I have already mastered, I think; at least, I am sure that I know the way to go to work to master them. I believe that I shall make this my next campaign. It may be years before it is finished, and it may not be a very long time.

MARINE SIGNALLING.

Mr. Edison looks farther ahead than this campaign, for he said: "I think it quite likely that I may try to develop a plan for marine signalling. I have the idea already pretty well formulated in my mind. I should use the well-known principle that water is a more perfect medium for carrying vibrations than air, and should develop instruments which may be carried upon sea-going vessels, by which they can transmit or receive, through an international code of signals, reports within a radius of, say, ten miles."

FLYING BY SEA AND BY SKY.

WHAT WE ARE COMING TO NEXT.

THE *Campania* has beaten the record of the Atlantic greyhound by the longer summer route in five days and sixteen hours. But this record, according to Professor Biles, who writes a very interesting article in the *North American Review* for June, is shortly going to be beaten:—

Ten years ago the time to cross from New York to Liverpool was practically eight days. The best that has been done up till now is a little over six days. Will the best time in ten years hence be a little over four days? There seems to be good reason to believe that it will be. To leave New York at noon and arrive at Southampton at noon on the fourth day out necessitates a speed of thirty knots an hour. A vessel 1,000 feet long, 100 feet wide, with a draught of water of thirty feet, with a structure built of stronger steel than that at present adopted, with lightened boilers, with oil or some equally light fuel instead of coal, and with the steady general improvements in methods of construction and management of ships and machinery, such a vessel will be capable of crossing the Atlantic in a little over four days. The design of such a vessel will involve the consideration of many problems of structural detail, but there is nothing insuperable in any of the difficulties which will accompany such a project.

The *Leisure Hour* for July reprints from the *Scientific American* an account of the newest flying machine that has just been invented by the head of the Smithsonian Institution, Washington, Professor S. O. Langley. Twenty months ago Professor Langley set four skilled workmen to construct the working model of the machine, and this has been perfected in a secret room in the Smithsonian Institution. The following is the description of the latest of many attempts to navigate the air:—

In configuration the body portion closely simulates a mackerel. The backbone is a light but very rigid tube of what is technically known as "titanium metal," one of the many alloys of aluminium and steel. It is 15 feet in length, and a little more than 2 inches in diameter. To give rigidity to the skeleton, ribs of stiff steel are provided, intersected at intervals by cross ribs of pure aluminium, the result being a lattice framework of great strength. The engines are located in the portion of the framework corresponding to the head of the fish. They weigh 60 ounces, and develop one horse-power—the lightest of that power ever made. There are four boilers, made of thin-hammered copper, and weighing a little more than seven pounds each; these occupy the middle portion of the fish. Instead of water, a very volatile hydrocarbon is employed, the exact nature of which is a matter of secrecy, but which vaporises at a comparatively low temperature. The fuel used is refined gasoline, and the extreme end of the tail of the fish is utilised for a storage tank with a capacity of one quart. There are twin-screw propellers, which would be made adjustable to different angles in practice, to provide for the steering. The engines develop a speed of 1,700 revolutions a minute.

The machine will be sustained in its flight by means of induced currents. The wings, or air-planes, which, like the edge of a bird's wing, will present to the air a surface of least resistance, consist of light frames of tubular aluminium steel covered with china silk. With the propulsion of the twin screws, they are expected to carry the machine up a gentle air-gradient, utilise the buoyancy of the atmosphere, and create sustaining currents of air. Like the heavier birds, such as the condor, which has to take a run along the ground before it can fairly launch itself in the air, Professor Langley's machine will probably require extraneous help to start it in its course. The wings, or air-planes, are in pairs; the rearward pair are the smaller of the two. Both are designed to be adjustable with reference to the angle they present to the air. Fixity of all the parts is secured by a tubular mast extending upwards and downwards through about the middle of the craft, and from its extremities run stays of aluminium wire to the tips of the aeroplanes and the end of the tubular backbone.

OUR FLOATING HOTELS.

MR. W. J. GORDON, in the *Leisure Hour*, gives an interesting account of the victualling of passenger steamers, from which I make the following extracts:—

The *Majestic*, out of an average crew of 322, has 114 stewards and cooks; the *Campania*, out of 415, has 159, consisting of one chief steward, 105 stewards, 8 stewardesses, and 45 cooks, bakers, etc., and these are at work early and late, cleaning, cooking, and serving. In these post-biscuit days the hot rolls and bread require the bakers to be afoot at four in the morning, and it is seven at night before the last baker's work is done. The cooks have to be up at half-past five. In the new Cunarders, for instance, the kitchen—without the bakery—is from twenty-five to thirty feet square, and besides an immense grill and other apparatus, contains a cooking-range twenty-five feet long, on which 170 stewpans can be worked side by side at the same time.

In that department the bills of quantities run large, for in a year the provisioning of only one boat will, as a fair average, include five hundred sheep, two hundred lambs, three hundred oxen, three thousand fowls, as many ducks and miscellaneous poultry, besides several thousand head of game and other sundries. Add to these a hundred thousand eggs, ten tons of ham and bacon, five tons of fish, two tons of cheese, one thousand tins of sardines, one hundred tons of potatoes, five thousand loaves and fifty tons of flour and biscuits, five tons of jam and marmalade, three tons of oatmeal, two tons each of rice and peas, pearl barley, plums and currants, and twelve tons of sugar, with a ton of tea and three tons of coffee, and you have what may be called the backbone of the daily fare. With it, considering all things, the drink bill will favourably compare, as it averages out per vessel per year at about fifty thousand bottles of beer, twenty thousand mineral waters, three thousand bottles of spirits, and five thousand bottles of wine.

And that reminds us that we have only mentioned the necessities, and said nothing of the luxuries, which we ought not entirely to omit. Let it be added, then, that each passenger averages three oranges, almost as many apples, and half as many lemons a day; that the ice cream supplied averages a pint a head a week; and that on an Atlantic trip, taken at a venture, the fruit bill included one hundred and sixty melons, one hundred pineapples, ten crates of peaches, ten bunches of bananas, one hundred quarts each of gooseberries, huckleberries, and currants, two hundred and fifty quarts each of raspberries, strawberries, and cherries, and seventy-five pounds of grapes.

The breakages are simply appalling. During one week not so very long ago the steward's returns on one well-known liner showed an average breakage list of 900 plates, 280 cups, 438 saucers, 1,213 tumblers, 200 wine-glasses, 27 decanters, and 63 water-bottles, all of which had, of course, to be made good on arrival in port.

A Card from Mr. Parker Snow.

MR. PARKER SNOW will be thankful if the Editor of the *REVIEW OF REVIEWS* kindly states that one or two anonymous contributions having reached him, he wishes to thus warmly acknowledge them. One from "An admirer of bravery and honesty," and two others, can only be thanked in this way. To his noble-hearted old friends, especially the one of so many years, no words can express all he feels; while to some few new ones he is, also, most warmly indebted. But the main hope he had of some fixed arrangements for his literary work, or to take it off his hands, and thus ensure some certain permanency for his declining days, has vanished. The quiet pursuits of his pen in the work he had so long been engaged upon have been turned into a far different channel by the futile results of Mr. Stead's nobly worded, though unsolicited, appeal.

Bexley Heath, Coronation-day Anniversary, 1893.

THE STORY OF THE DISCOVERY OF BRITAIN, B.C. 330.

THE STORY OF THE VOYAGE OF PYTHEAS.

MR. CLEMENT R. MARKHAM contributes to the *Geographical Magazine* for June a very interesting account of the Greek Pytheas, who, in the days of Alexander the Great, first discovered Britain.

A GOVERNMENT EXPEDITION.

The Government of the Greek colony of Massalia, the modern Marseilles, about the time of Alexander the Great and Aristotle, or 330 B.C., equipped a naval expedition to discover the unknown lands that lay in the unexplored North. Pytheas was a poor wise man, a great mathematician and astronomer.

His ship was a good sea boat, and well able to make a voyage into the northern ocean. She would be from 150 to 170 feet long—the beam of a merchant ship being a quarter, and of a warship one-eighth the length—a depth of hold of 25 or 26 feet, and a draught of 10 to 12. Her tonnage would be 400 to 500, so that the ship of Pytheas was larger and more seaworthy than the crazy little *Santa Maria* with which, eighteen hundred years afterwards, Columbus discovered the New World.

HOW PYTHEAS FARED FORTH TO THE NORTHWARD.

Pytheas, the first of the great explorers, like the illustrious Genoaese of later times, prepared himself for his difficult task by long and patient study of the astronomical bearings of the question. Thus well-provided with all the knowledge of his time, he raised his anchor, and commenced his coasting voyage towards the Sacred Promontory, the western limit of the known world. The Grecian ships were supposed to make an average of about 500 *stadia*, or 50 miles in a day's sail, the *stadium* being the unit of measurement for all geographical distances. Coasting along near the shore, the ship of Pytheas skirted the Spanish and French coasts, and then the explorer left the north coast of Gaul, and shaped a direct course for a part of Britain which he called Cantion (Kent), the Cantium of Cæsar. This must have been the route, because he reported that the coast of Gaul, where he left it, was some days' sail from Cantion.

THE DISCOVERY OF ENGLAND.

The Cantion of Pytheas was doubtless the modern Kent, although it may be intended to include additional territory to the north. Here he stopped; and we are told that he not only landed, but travelled over a part of Britain on foot. He probably went westward to collect information respecting the tin trade, which in those days would have entailed a very difficult and perilous journey.

Britain, in the third century before Christ, was almost in a state of nature. The valleys were covered with primeval forests, their lower parts were occupied by vast swamps, and it was only on the downs and hill ranges that there were *Gwents*, or open clearings. Still the Celtic tribes had been in possession for several centuries, and had made some advances in civilisation.

AND OF BEER.

Several pieces of information respecting the natives of Britain, related by Pytheas, have been preserved. In consequence of the rain and absence of sun, the former did not use threshing-floors, but threshed their corn in large barns. They stored the ears of corn in pits underground, and the part that had been longest in store was brought out daily and prepared for food. They made a fermented liquor from barley, which they used instead of wine; it was called *curmi*. As Columbus was the discoverer of tobacco, so his great predecessor, Pytheas, discovered beer. Pytheas also says that the Britons made another drink from honey. Their houses were of wood and thatch, and he mentions the war-chariots, but adds that the chiefs were generally at peace with each other.

OF SCOTLAND.

When Pytheas returned to his ship, in some haven of Cantion, he proceeded northwards along the coast of Britain, until he

reached a point at the northern end of Britain, where the length of the longest day was eighteen hours. The corresponding latitude is 57° 58' 41" N., which is that of Tarbett Ness, in Ross-shire. As he advanced to the Pole, he found that the cultivated grains and fruits, and almost all domesticated animals, gradually disappeared. The people in the far north were reduced to live on millet, herbs and roots. The intrepid explorer still pushed onwards to discover the northernmost point of the British Isles. Coasting along the shores of Caithness and the Orkney Islands, he finally arrived at a land where the length of the longest day was nineteen hours. This was in latitude 60° 51' 54" N.

AND OF THE ARCTIC REGIONS.

Pytheas received information of an Arctic land called "Thule," at a distance of six days' sail, and near the frozen ocean. Even as we have it, the account is a good description of a dense fog at the edge of the pack, amongst sludge ice, which "can neither be travelled over nor sailed through." He might have seen such ice occasionally, at no great distance from the Shetlands.

Pytheas was thus not only the discoverer of Britain, but the first explorer who received information respecting the Arctic Regions. He was, as Professor Rhys has truly said, "one of the most intrepid explorers the world has seen." If, as we may infer from their approximate accuracy, the five observations for the length of the longest days were taken by the explorer himself, the voyage must have occupied about six years. Sailing southwards from Orcas, Pytheas returned to Cantion, and continued the long voyage onward to Massalia.

Lesseps in Ruin.

MR. ROBERT SHERARD has a very pathetic paper in *McClure's Magazine* describing a visit which he paid to the country seat where old M. de Lesseps, of Suez and Panama notoriety, is slowly wasting towards death. Mr. Sherard says:—

He has the fixed idea that the Queen of England will come and make all things right. He often rises in his chair and asks if Queen Victoria has arrived, and when any visitor comes he thinks that it is she at last.

Then, blanching, the countess added: "You think, sir, do you not, that he is in ignorance of what has happened? You do not think that he has any suspicion? Sometimes the dreadful thought troubles me that he knows all, and that, great-hearted gentleman that he is, he lends himself to this most tragic comedy that we are playing. I sometimes doubt. Would not that be terrible? And again there are times when I am convinced that our efforts to hide all that is successful. We give him last year's papers to read. I have had collections sent down. Formerly we used to cut out or erase parts which we did not want him to see, but he seemed to notice the alterations, and so we ordered down papers of a year ago. And it is quite pathetic to hear the remarks he occasionally makes. Thus a few days ago he called me to his side in high glee, and said how happy he was to hear that his old friend M. Ressenman had been appointed Italian Ambassador to France, an event of more than a year ago. There are times, too, when he gets very impatient at being kept down here, and what he misses chiefly is the French Academy. He is constantly telling me how anxious he is to attend, and I have to invent the sorriest fables to explain to him that the Academicians are not holding any meetings—as, for instance, that they are all old men, and that they are taking a long holiday."

The countess sighed, and said: "I do what I can, but that terrible doubt pursues me often. You see, he did know that the Panama affair had resulted in ruin. It is since he was called before that examining magistrate, M. Prinet, that he has been as you have seen him. He must suspect something. How much, we shall never know." Then she added: "He is constantly asking after Charles. He knows that he is in trouble, but we hope that he does not suspect what the trouble is."

M. de Lesseps sleeps a great deal, and sinks slowly towards the grave.

THE LAST DAYS OF THE WORLD.

BY CAMILLE FLAMMARION.

In the *Cosmopolitan Magazine* for March, M. Camille Flammarion begins an imaginative account of the destruction of the world, which is entitled "Omega: the Last Days of the World." The scene is laid in Paris several hundred years hence, and the article deserves, and will receive, considerable attention as an interesting exercise of the scientific imagination.

THE APPROACH OF THE COMET.

The scene is laid in Paris, which has telephonic communication with the observatories on all the highest peaks in the world. The story opens at the time when the life of the great capital is paralysed by the intimation of the rapid approach of a comet thirty times the size of the world. M. Flammarion incidentally prophesies dismal things as to the development of the Press, which he thinks will go from bad to worse. He does not carry his story down further than the first part of the debate, in which various theories are mooted as to the way in which the impact of the comet on our world will affect life on this planet.

The following extracts from the chief astronomer's speech gives an account as to what would happen if a comet like that of 1811 were to collide with the earth:—

TO BE BURNT UP IN SEVEN HOURS.

The destruction of the world will result from the combustion of the atmosphere. For about seven hours—probably a little longer, as the resistance to the comet cannot be neglected—there will be a continuous transformation of motion into a heat. The hydrogen and the oxygen, combining with the carbon of the comet, will take fire. The temperature of the air will be raised several hundred degrees; woods, gardens, plants, forests, habitations, edifices, cities, villages, will all be rapidly consumed; the sea, the lakes, and the rivers will begin to boil; men and animals, enveloped in the hot breath of the comet, will die asphyxiated before they are burned, their gasping lungs inhaling only flame.

WHICH WILL BURN FIRST.

If our latitude were to receive the first shock of the comet, reaching us, we will suppose, in summer, the tropic of Cancer, Morocco, Algeria, Tunis, Greece, and Egypt would be found in the front of the celestial onset, while Australia, New Caledonia, and Oceania would be the most favoured. But the rush of air into this European furnace would be such, that a storm more violent than the most frightful hurricane and more formidable even than the air-current which moves continuously on the equator of Jupiter, with a velocity of 400,000 kilometers per hour, would rage from the Antipodes towards Europe, destroying everything in its path. The earth, turning upon its axis, would bring successively into the line of collision the regions lying to the west of the meridian first blasted. An hour after Austria and Germany it would be the turn of France, then of the Atlantic Ocean, then of North America, which would enter somewhat obliquely the dangerous area about five or six hours after France—that is towards the end of the collision.

FIRST STIFLED, THEN BURNED.

The terrestrial globe being thus entirely surrounded by the cometary mass for nearly seven hours, and revolving in this incandescent gas, the air rushing violently towards the centre of disturbance, the sea boiling and filling the atmosphere with new vapours, hot showers falling from the sky-cataracts, the storm raging everywhere with electric deflagrations and lightnings, the rolling of thunder heard above the scream of the tempest, the blessed light of former days having been succeeded by the mournful and sickly gleamings of the glowing atmosphere, the whole earth will speedily resound with the funeral knell of universal doom, although the fate of the dwellers in the Antipodes will probably differ from that of the rest of mankind. Instead of being immediately consumed, they will be stifled by the vapours, by the excess of

nitrogen, the oxygen having been rapidly abstracted, or poisoned by carbonic-oxide; the fire will afterwards reduce their corpses to ashes, while the inhabitants of Europe and Africa will have been burned alive. The well-known tendency of carbonic-oxide to absorb oxygen will doubtless prove a sentence of instant death for those farthest from the initial point of the catastrophe.

M. Camille Flammarion breaks off his story with an interruption, caused by the announcement that the inhabitants of Mars were photophoning to the earth, and the meeting was adjourned in order to ascertain what it was that they had to say.

THE COLLISION WITH THE COMET.

In the June number, M. Flammarion brings the comet into collision with the world. But the end of the world is not to happen till the August number. The catastrophe described last month was but the preliminary canter as it were. Here is the French astronomer's picture of what happened when the comet struck the earth:—

Already the cometary fringes had invaded the lunar orbit. At any moment they would reach the rarer limits of the earth's atmosphere, only 200 kilometers away.

Then every one beheld, as it were, a vast conflagration, kindled over the whole extent of the horizon, throwing skyward little violet flames. Never before had the earth been bathed in such a light, which at first seemed to be colourless, emitting lightning flashes from its pale and wan depths. The dryness of the air, hot as the breath of a furnace, became intolerable, and a horrible odour of sulphur, probably due to the super-electrified ozone, poisoned the atmosphere. Every one believed his last hour was at hand.

"THE EARTH IS ON FIRE!"

A terrible cry dominated every other sound. The earth is on fire! The earth is on fire! Indeed, the entire horizon was now illuminated by a ring of bluish flame, surrounding the earth like the flames of a funeral pile. This, as had been predicted, was the carbonic-oxide, whose combustion in the air produced carbonic-anhydride.

Suddenly, as the terrified spectator gazed silent and awe-struck, holding his very breath in a stupor of fear, the vault of heaven seemed rent asunder from zenith to horizon, and from this yawning chasm, as from an enormous mouth, was vomited forth jets of dazzling greenish flame, enveloping the earth in a glare so blinding, that all who had not already sought shelter, men and women, the old and the young, the bold as well as the timid, all rushed with the impetuosity of an avalanche to the cellarways, already choked with people. Many were crushed to death, or succumbed to apoplexy, aneurismal ruptures, and wild delirium resulting in brain fever.

HOW THE EARTH ESCAPED.

Although, at the instant of collision, the greater part of the hemisphere on the side of the comet had been affected by the constricting dryness, the suffocating heat and the poisonous sulphurous odours, as well as by deadening stupor, due to the resistance encountered by the comet in traversing the atmosphere, the supersaturation of the ozone with electricity, and the mixture of nitrogen protoxide with the upper air, the other hemisphere had experienced no other disturbance than that which followed inevitably from the destroyed atmospheric equilibrium. Fortunately, the comet had only skimmed the earth, and the shock had not been central. Doubtless, also, the attraction of the earth had had much to do with the fall of the bolides in Italy and the Mediterranean. At all events, the orbit of the comet had been entirely altered by this perturbation, while the earth and the moon continued tranquilly on their way about the sun, as if nothing had happened. The orbit of the comet had been changed by the earth's attraction from a parabola to an ellipse, its aphelion being situated near the ecliptic. When later statistics of the comet's victims were obtained, it was found that the number of the dead was one-fortieth of the population of Europe.

HOW TO EDUCATE A JOURNALIST.

AN INTERESTING AMERICAN SYMPOSIUM.

"The Newspaper and the College" is the title of a very interesting article in the *Educational Review* for June. President Thwing, of the Adelbert College of the Western Reserve University, Cleveland, Ohio, wrote to several leading editors, asking them, "What more can the colleges do than they are now doing in fitting men to do newspaper work?"

TEACH HIM ENGLISH.

He publishes replies from fourteen editors, who chiefly seem to desire that the colleges should teach would-be journalists to write English. Mr. Ayres, of the *Boston Advertiser*, says:—

An immensely increased attention should be given to the study of English composition. I spend from an hour to three hours daily in correcting the grammar, diction, sentence construction, and eliminating the tautology of college graduates who stood among the highest in their classes, most of these graduates being from leading New England institutions.

GIVE HIM A GOOD GENERAL EDUCATION.

After English, journalists need most a good general education. Mr. Godkin, of the *Evening Post*, New York, says:—

My opinion is that you should not make any change in your curriculum in preparing young men to be editors and reporters. What they all need most, according to my experience, is a good general education, more especially in history, political economy, and constitutional law. Nothing does an editor so much good as a course in a law school. The later a young man enters a newspaper office, the more likely to prove valuable I consider him. There is nothing to learn in a newspaper office which a man of ordinary ability and a good college education cannot learn in a week or two. The editorial ignorance on all topics but the ins and outs of American party politics is the great bane of the newspaper, and the great hindrance to its influence and usefulness. Cure that and you will render the country an immense service.

AND A VERY WIDE KNOWLEDGE OF THINGS.

The editor of the *Independent* has a very exalted notion of what an editor should know. He says:—

A good editor must have a very wide general knowledge of things. He must not be a specialist, ignorant of things outside of his speciality. The extension of the system of electives is injurious, I suspect, to editorial success, because it is apt to leave large tracts of knowledge unvisited. An editor must have a good smattering, if possible more than a smattering, of pretty much everything. He must know enough of principles and enough of facts to detect charlatanisms, to know what to leave out, which is, perhaps, a first qualification. He should be a fair student of mental philosophy, and physics, and biology, and literature, and history, and political economy. It is not necessary that he should remember all that he has ever learned, but he should have his principles so far ingrained in his mind that he knows nonsense when he sees it. It is precisely with an editor as it is with a college president, whose first qualification is that he can tell a trustworthy scholar who is fit for a professor. An editor needs that genius for distinguishing the true from the false, the competent from the incompetent, the trustworthy from the deceptive. The rhetorical qualifications of an editor are directness and vivacity; but you cannot teach these things.

HOMER AS A REPORTER.

President Thwing, summing up the correspondence, notes sadly that none of the editors plead for Latin and Greek. Yet says President Thwing:—

Few reporters, possibly, would agree with me, but I venture to say that no reporter could have a better model than Homer. Homer has that faculty which is of the greatest value to the reporter—knowing how to see—and he tells what he sees with

exactness and fullness; he also tells it in a way always picturesque and interesting.

NO SCHOOL OF JOURNALISM POSSIBLE.

He observes that none of the editors believe in schools for journalism. He says:—

The attempts made to found a school of journalism, although few and sporadic, have met with lamentable failure. The comprehensive reason of these failures lies in the fact that journalism is an art, and is therefore to be learned by practice. It represents also a science, the essence of which can as well be taught as is the science of medicine and of law; but the art of it, like any other art, is best learned by practice.

THE SUMMING UP OF THE WHOLE MATTER.

It is therefore evident that the best general preparation which a man who desires to become an editor can receive, is a college education. This education should be at once broad, and special, complete in itself, and also preparative. It should be broad, for journalism covers a larger range of subjects, by a greater diversity of method, than any other profession. It should be special, because the newspaper represents a special agency. Throughout his course, too, the student who proposes to become an editor should devote special attention to writing. This writing should be done under the supervision of teachers inspiring and severely critical. His writing also may well have a place in the college papers, which, on the whole, are admirably made. In the last two years, English literature and language, historical and sociological studies, should predominate; but it is to be added that these studies should be made the basis of further research. Every man who is to become an editor would do well to devote at least two years following his graduation to studies in history, sociology, and English literature and language. These studies represent his professional equipment.

THE "CHRISTIAN WORLD."

INTERVIEW WITH MR. EDITOR CLARKE.

In the *Young Man* for July there is an article on Mr. J. G. Clarke, editor of the *Christian World*. It is not quite up to the average, possibly owing to the retiring modesty of the subject. The following extracts give the most interesting passages:—

WHAT WOULD A DAILY COST?

"Why do you not make the *Christian World* a daily? You have a better opportunity than anybody else."

"So far as I am concerned, one reason is sufficient—there are limits to everybody's working powers. For myself, I could not work that and keep the other on too. Of course, we have thought of the idea, but never went to the point of making practical calculations."

"You don't feel that it may be necessary to do it in self-defence?"

"We have not felt that yet. It would be a great risk for any man, or set of men; and for our part, we would not think of attempting it unless we were prepared to spend from £50,000 to £100,000 before seeing a penny back."

WHAT THE "CHRISTIAN WORLD" BELIEVES

"Could you state the doctrinal basis of the paper?"

"Though I think that the paper is a sufficient answer to that question, I may say that while considering spiritual religion as a life which it is impossible to adequately express in any definition, the *Christian World* is content to state its position as founded on the teachings of the New Testament, unencumbered by the ecclesiasticism and traditional accretions of a later time, and interpreted in the light of the instructed Christian consciousness of to-day. Believing that the Divine Spirit, through whose agency humanity has received the Scriptures, the Christ and the Church, is still operating in the world, it holds all truth as sacred, and has no fear that the revelations of science, or the verdicts of sound criticism and philosophy will ever invalidate the claims of essential Christianity. For myself, I am a Congregationalist and a member of a Congregational Church."

HOW TO LIVE ON HALF-A-CROWN A WEEK.

THE Young Woman for June publishes a letter from a young lady correspondent describing how a lady can live comfortably and contentedly on 2s. 6d. per week:—

I purchase always at large clean shops, and invariably from the same greengrocer and fishmonger; they get to know me, and what I need, and are glad to please me. I allow 3½d. per week for milk—½d. per day—but when the weather is warm, I have a tin of best Swiss condensed milk at 5½d.; then, as sugar is unneeded, and a tin will last more than a week, the expense is not more. I do not drink coffee; a tin of cocoa at 10½d. lasts many weeks, as I take it only for supper when wet, cold, or very tired. My supper usually consists of a digestive ginger biscuit (two a penny), or two or three lunch or gingerbread biscuits (½d. per lb.), and a cup of hot water with just a squeeze of lemon in it. Then I can sleep well. I make a ½ lb. of 2s. tea last three weeks; I have one cup freshly made for breakfast and two for tea. I also have for breakfast, in cold weather, either oatmeal porridge (soak the meal overnight and boil it in same water half an hour), or Symington's pea-flour—one table-spoonful flour, small lump of butter and salt, boiling water poured over to form thick batter.

I have but one loaf of bread a week, and that is generally of whole-meal at 3d.; but I get a little tired of brown bread sometimes, and have a white loaf at 2d. Then I have a whole-meal scone at 1d. for tea, or a dry biscuit. In the warmer weather brown bread and hot milk are nice, and if possible, an orange or some stewed fruit as well, for breakfast.

One shilling tin of Bovril lasts a fortnight. It is delicious plain, thickened with a teaspoonful of "Symington's," or poured over any boiled vegetables or curried rice.

I do all my cooking with a Beatrice oil stove and two enamelled saucepans at 6d. and 10d.

EXPENDITURE.

First Week.			Second Week.		
	s.	d.		s.	d.
Tea	0	2	Tea	0	2
Milk	0	3½	Milk	0	3½
½ lb. butter	0	3½	Butter or jam	0	3½
Brown bread	0	3	White loaf	0	2
White loaf	0	1	Germ scones	0	2
Sugar	0	1	Porridge	0	2½
Mackerel	0	3	Bovril	0	6
Salad	0	2	Vegetables	0	3
Cheese	0	2	Apples	0	2
Onion and cauliflower	0	2	Rice	0	1
Pineapple	0	6	Rhubarb	0	1½
Rhubarb	0	1	Biscuits	0	1½
	2	6		2	6
Third Week.			Fourth Week.		
	s.	d.		s.	d.
Tea	0	2	Tea	0	2
Milk	0	3½	Milk	0	3½
Butter	0	3½	Butter	0	3½
Brown loaf	0	3	White loaf	0	2
White loaf	0	1	4 coconut cakes	0	2
Bovril	0	6	Ham & cheese	0	2½
Vegetables	0	3	Cheese	0	2
Egg	0	1	Salad	0	2
4 oranges	0	2	Apricots	0	6½
Sugar	0	1	Porridge	0	1
Stewed raisins	0	2	Rhubarb	0	1
	2	6		2	6

Dinners for First Week.

Saturday	Stewed mackerel, beef and butter, rhubarb.
Sunday	Cold mackerel in vinegar, with salad, pineapple.
Monday	Cheese sandwich and salad, pineapple.
Tuesday	Boiled onion, white sauce, pineapple puree.
Wednesday	Soup (Edwards' desiccated), remainder of yesterday's onions, cheese.
Thursday	Cauliflower with sauce, rhubarb stewed with candied peel.
Friday	Cheese sandwich, cold rhubarb.

Dinners for Second Week.

Saturday	Anything that's left, stewed apples.
Sunday	Plain Bovril, cold stewed apples.
Monday	Onion fried, with Bovril, cheese.
Tuesday	Soup, hot rhubarb.
Wednesday	Cauliflower with thickened Bovril, cold rhubarb.
Thursday	Remains of cauliflower and curried rice, apple.
Friday	Plain Bovril, biscuit.

Dinners for Third Week.

Saturday	Just anything, stewed raisins.
Sunday	Plain Bovril, pulled bread, cold raisins.
Monday	Plain Bovril, pulled bread, orange.
Tuesday	New potatoes, Maitre d'Hotel sauce, orange.
Wednesday	New potatoes, Maitre d'Hotel sauce, m. de hot, cheese.
Thursday	Plain Bovril, orange.
Friday	Soup, orange.

Dinners for Fourth Week.

Saturday	Remains of soup, coconut bun.
Sunday	Cheese, salad, apricots, pulled bread.
Monday	Boiled haddock, sauce, apricots.
Tuesday	Cold haddock, last of apricots as puree.
Wednesday	Cheese sandwich, hot rhubarb.
Thursday	Last of pulled bread with cheese, cold rhubarb.
Friday	Cup of cocoa and coconut cake.

I have a tiny storebox, which generally contains tin of Edwards' desiccated soup, ½d. tin of pea-flour, a little wheat-flour or rizin for sauces, bottle of Yorkshire Relish for ½d., dried herbs, cayenne, salt in stoppered bottle, vinegar, etc. These little things I get one at a time by going without something else. Two lemons at 1½d. will squeeze over fish, then be scalded with sugar for lemonade; and after that the white part scraped away, remainder chopped up finely and boiled with a little sugar, cup of water, and one Seville orange for breakfast marmalade. With all tart fruits or rhubarb I put a pinch of Californian borax or carbonate of soda. This neutralises the acid, and very little sugar is required. Rhubarb is nice plainly stewed with a little candied peel, sweetened, strained, a little gelatine dissolved into it, and poured into a mould. Dates and figs are nourishing for those who like sweet things. Where cheese is not liked, sandwiches can be made of potted ham and chicken or turkey and tongue. Two or three ladies dining together could have more variety. I take my meals as regularly as possible—at eight, one, five, and nine o'clock; rise at half-past six, take cold bath; retire at eleven, taking a hot bath quickly if exhausted. Although not strong, I rarely require medicine, and my health is far better than when staying with friends where the food is richer.

Women in Prison.

THE Literary Northwest for June publishes the papers read at the Minnesota Convention on "Charities and Correction." Among others there is a valuable paper demanding the right of female prisoners to be looked after by women. The writer says:—

We believe that women should manage and control women's prisons, because a board of women properly appointed without remuneration, having under control a paid corps of keepers and a matron or superintendent, a teacher and the necessary instructors in industrial work, would give time and thought to the individual cases that no man for a moment would think possible. They could and would extend their care to the families of the prisoners, thereby furnishing a strong lever of control at once to their hands.

Lady Doctors.

In the *Medical Magazine* for June 15th, Dr. Jex Blake, surveying the successful campaign which she so largely helped in winning for medical women, says that the battle is now almost over. Medical women need some endowments—for the men monopolise the money, as usual; but the cash will come in good time:—

At the beginning of 1893 the number of women who had entered their names in the "British Medical Register" amounted to 158, of whom nine have died since registration. About fifty are in practice in India and other parts of the East, chiefly as medical missionaries; some of the younger women (perhaps twenty) are still engaged in study at various schools and hospitals, chiefly on the Continent; and the remainder are in practice in various part of Great Britain, more than half of these having settled in London. The number of posts thrown open to medical women increases every day, and the demand for their services in various directions is still considerably in excess of the supply.

PRUSSIANISING GERMANY.

A FRENCH STUDY OF THE PROCESS.

IN the *Revue des Deux Mondes* of the 15th of June M. Charles Benoist is the author of an interesting article entitled "The Reichstag, the Emperor, and the German Empire." He begins his account of the present struggle between an Emperor and his Parliament by carrying his readers back to the previous conflict of 1837. Six years ago last January the Iron Chancellor was in full power, acknowledging no one as master but old Emperor William, and against his military Bill, which involved, it will be remembered, an increase of 50,000 men and a proportionate taxation, the Parliament "kicked like a young horse hoping to throw its heavy rider." As all the world knows, Bismarck got his way, and the horseman held tight on his plunging steed. But times are changed—the old king is dead, the one-time Iron Chancellor is in retreat, and a young man is now facing the People. M. Benoist, it is curious to note, treats the question from a philosophical point of view, saying, *à propos* of the present hour, that the appeal of William the Second to Germany is "not an act of personal policy, and that the present crisis is not an accident, if, in the profound calm of the present moment, the word 'crisis' may be allowed. Its true cause is a development of German nationality on the model of that of Prussia. 'Germany,' he continues shrewdly, 'though outwardly unified, has, like Shakespeare's unhappy Hamlet, two souls,' born of the marriage of the North and South; she exemplifies a psychological dualism, possessing the feudal military soul of Prussia, and the dreamy, poetic spirit of the land of the Rhine. One soul is rude and imperious by nature, the other soft and musical; from thence arise two distinct tendencies, nay, even two distinct conceptions of the end of existence. 'To be strong, feared, and the master of men,' is the cry of the Prussian soul; to enjoy life is the sighing aspiration of the German. Prussia has at present got the upper hand, because the position of the Empire defined by artificial frontiers on every side is one of constant national peril. But if the more intellectual sympathies of Germany succeed in domineering Prussian prudence and Prussian arrogance, a disruption of the Empire might occur. But in this M. Benoist does not at all believe. 'However strong may be the antagonism of the two elements there is something still stronger—the feeling for Germany; a milder and less burdened Germany is doubtless desired by many; but none desire to see it crumbling to nothing. A German Empire progressing towards unity is what exists; any other conception is pure fantasy. On so solid a base is the German Empire founded that not even a revolution could destroy it. Germany is already amalgamated, and an internal crisis is all that is needed to weld every part. To Germans the Imperial power is a creation of the modern world, fitted out with modern organs, breathing out a modern breath. It satisfies at once their patriotism and their philosophy. Do not let us be deceived by superficial aspects. Those who speak otherwise, and who dream of a realm undone, and brought back to be a chain of confederate states, understand neither Germany nor Prussia, neither the place of the Emperor in the Empire, nor that of the family of the Hohenzollerns in Prussia.'

M. Benoist's article is interesting, as well as painstaking in its analysis of parties. He concludes by saying that united Germany is the achievement of Prussia, and Prussia of its victorious army, and the army of the royal house of Hohenzollern, which "sits upon the summits of the mountains, and governs from the plain of the sea."

HOW WAR WAS AVERTED IN 1875.

A REPLY TO M. DE BLOWITZ.

IN the June number of the *Deutsche Revue* "Senex Diplomaticus" replies briefly to M. de Blowitz's sensation published in *Harper* in May.

To begin with, "Senex Diplomaticus" asserts that M. de Blowitz is absolutely wrong in his statement that Count von Moltke and Prince Bismarck were not of one mind with regard to the question of immediate war, and that Prince Bismarck was totally ignorant of the plan of the military party, and was only actually informed of it by M. de Radowitz, the French Ambassador at Berlin, and so was able to assure the Tzar later on that he was quite innocent in the matter of the scare.

Count von Moltke and the Chancellor held different views about many things, but, says "Senex Diplomaticus," they were most certainly in accord on the question of a war with France in 1875. It was, of course, easier for the Count than the Chancellor to decide in favour of war. France had recovered so quickly from the war of 1870-1 that the Count may naturally have thought it dangerous to let her complete her military reorganisation in peace, in case she was also thirsting for revenge on Germany. The Chancellor, on the other hand, could not favour war, unless he had first invented a plausible pretext for it, and could then also convince the other nations of its plausibility, so that when war was declared France might find herself without allies. It was with the practical purpose of securing Russia's neutrality, and not on a kind of academic mission, as M. de Blowitz puts it, that M. de Radowitz was despatched to St. Petersburg. Prince Bismarck's mistake lay in believing that Russia's consent was obtainable, seeing that she was interested rather in the annihilation of France, and he was further mistaken in still believing—M. de Radowitz's failure notwithstanding—that a case against France could be got up by revelations to the press.

No one can ever be persuaded that for weeks the whole world, without any real cause, was quaking lest war should break out, and remember at the same time that Lord Derby, on May 30th, when rejecting the proposal because it was not in the interests of peace, declared that not only the press but persons of the highest authority and standing had said it was inevitable that Germany must prevent France from maintaining an army beyond a certain minimum strength. It is conceivable that this should have excited M. de Radowitz, and that he should have written to Paris in that strain, and it is also true that M. de Radowitz made a remark casually about war being inevitable; but it is highly improbable that he should have supplied the Marquis de Gontaut-Biron with such data of Count von Moltke's intentions against France as M. de Blowitz reports.

However, as soon as the Emperor William, who was at Wiesbaden, heard of the unrest, he put his foot down so firmly that the Chancellor saw the game was lost; but M. de Blowitz's idea of the warlike plans of Moltke being crossed and shattered by the bold but indirect tactics of Prince Bismarck, and of the eternal debt of gratitude which the French owe the Chancellor in consequence, is so grotesque that it could only have arisen in the imaginative brain of the *Paris Times* correspondent.

"Senex Diplomaticus" seems to think that he is doing Bismarck a service in thus proving that he was willing and ready to begin war again in 1875, solely for the purpose of annihilating France. On this point opinions will differ. The fallen Chancellor may well cry, save me from my friends!

THE ENGLISH IN MOROCCO.

THE FEARS OF A FIDGETY FRENCHMAN.

In the *Revue des Deux Mondes* of the 15th of June M. E. Plauchut writes, from the French point of view, an alarmist article entitled "The English in Morocco." It is instructive to discover what our neighbours think of us, and how they regard England's practical possession of the Suez Canal, "by which the commercial interests of Spain, Holland, Italy and France might be," remarks the writer, "ruined by the turning of a key." M. Plauchut considers that Gibraltar, "an ancient Spanish fortress," being now "English for ever," and Malta and Cyprus having been taken from their legitimate possessors by force or cajolery prove that his apprehensions are more than justified. His feelings are also hurt at seeing on our Admiralty charts the sea between the French and English coasts marked as the *English Channel*, and evidently fears that if the Anglo-Saxons acquire predominance in Morocco, and shake hands from some African promontory with their own Gibraltar, the blue Mediterranean which bathes the shores of French Provence will become an English lake. "Did not England bombard Alexandria," he asks, "and might she not quite as causelessly attack Tangiers?" When Spanish troops were marching on Tetuan in 1859, the English ambassador of Madrid is affirmed to have caused their recall by an effectual remonstrance, and demand for payment of an old debt. The Sultans of Morocco are the last remaining potentates (old style) existing on the north coast of Africa, and it is a sore regret with them that they can no longer be Corsairs in the Mediterranean waters.

M. Plauchut quotes a characteristic letter written in 1684 by Muley Ishmael to Sir Cloudesley Shovel (a British worthy whose monument may be seen in Westminster Abbey, clad in a peculiarly grotesque costume), in which Muley, who was very angry with James II., observes, "I have written letters to the King of England which ought to satisfy him, but I have had, as yet, no answer; you have taken several of our vessels and have sunk others; you have cruised along our coasts, and that is not the way to establish a good peace, neither is it the way an honest man sets to work. Thank God you have left Tangiers, for it belongs to us. We are going to cultivate the surrounding country; it is the best of our territories. As for the slaves you have taken, you can do what you like with them; you are welcome to throw them into the sea, and whatever else pleases you. But be sure that when the English merchants have paid their debts I shall turn them all out." Sir Cloudesley Shovel replies that as a Christian he did not think that he could throw the slaves into the sea, and he tries to obtain an exchange of English prisoners of war.

Finally, M. Plauchut gives a vivid picture of "Moghreb," the ancient Moorish town, boasting of an immense seraglio that would have made Solomon's look small; a Jewish Ghetto, sordid in aspect, but full of wealth acquired by usury; and the city which only wakes at night, when the narrow streets are filled with mystery and violence, and along which the inhabitants steal torch in hand.

Except that the Christian captive no longer perishes of gaol fever like the three unfortunate Capuchin fathers whom Cardinal Richelieu sent on an embassy with an escort of thirty men in the seventeenth century, Morocco is much what it was three hundred years ago. That it is not cleared out and brought into the light of Western civilisation is, M. Plauchut assures us, the fault of that greedy nation of shopkeepers, who are only waiting their opportunity to include this important African territory in their plan of universal domination by land and sea.

WITCH BURNING IN FRANCE.

A CHAPTER IN THE ANNALS OF CRIME.

In his second article on the "Witchcraft Trials of the Seventeenth Century" in the *Nouvelle Revue*, M. Delacroix, although writing from a sceptical point of view, and with apparently no belief in the marvels he himself admits to have been widely believed and vouched for by credible witnesses, gives an interesting addition to the history of mediæval spiritualism. Not only the credulous and the ignorant, but some of the most noted scientific and medical authorities of the seventeenth century evidently took the spirits *au grand sérieux*; notably Felix Blater, who for more than fifty years was known as a Swiss Prince of Science, made an exhaustive inquiry into the subject, and finally acknowledged that there was no doubt that evil and other spirits might take possession of a human being. Daniel Senart, a medical professor of Wittenburg, also recognised that those possessed by spirits acquired the power of taking aerial excursions, in what spiritualists of to-day would call their astral bodies. As for the magistrates, they never doubted at all the power of spirits or the existence of sorcery. De Thou, the well-known mediæval historian, was a firm believer in astrology. Nicolas, who seems to have been the first writer to utter a protest against torture, declared that to deny the existence of sorcerers was a sure mark of ignorance. Many judges were afraid of condemning witches for fear of the result to themselves; but a councillor reassured them by observing that "nothing can happen without the will of God; against His justice the sorcerer can do nothing; neither can the little devils who are their masters."

M. Delacroix gives a striking account of Pierre de Lanert, a councillor of the Bordeaux parliament, who was sent by the authorities to judge a number of demoniacs in the Labourd district; by his order five hundred of these poor creatures were burned to death, and he wrote on the subject of demoniac possession two important works, which gave him quite a reputation in the literary world of that day. And yet this Lanert, points out the writer in the *Nouvelle Revue*, who evidently believed the extraordinary confessions made him by his victims; was "a man of the world, a laborious lawyer, a distinguished writer, whose eloquent and easy style often rose to grandeur, and who was so far in advance of his century that in one of his works, the '*Livre des Princes*,' he was not afraid to say that the Law was greater than the King."

It is clear that, from the highest to the lowest, all took the most passionate interest in witchcraft and sorcery, and literally hundreds of works were written anent the subject, while the great barristers of the day were often asked for counsel's opinion on difficult or complicated sorcery cases! In 1635, a long and solemn discussion took place between Bonamy and Bosville "touching the spirits" before a Grand Chambre of Rouen, and it is curious to note that there seems to have been a general impression that "the feebleness, the curiosity, the sensibility"—in a word, every feminine instinct—made a woman more accessible than a man to the enterprises of demons, and there were at all times more witches than sorcerers. The Reformation, which made such vast changes, overthrew so many barriers, and caused so many differences of opinion, did not modify in the least popular belief in spiritualism. Indeed, the only object of both Protestants and Catholics was to prove that the other side suffered most from the domination of Satan.

M. Delacroix, who is making an exhaustive research into the subject, promises in his next article much curious additional matter which he has found in old German manuscripts.

A PLEA FOR MISSIONARY JUDAISM.

BY OSWALD JOHN SIMON.

IN the *Jewish Quarterly Review* for July Mr. Oswald Simon addresses to deaf ears his plea for establishing a missionary propaganda on Jewish lines. Mr. Simon believes in Judaism as a message for the world, and not only for those who are lineal descendants of Abraham. He is, however, very anxious that Judaism should fulfil its mission, and by way of making a beginning, he puts forth the following suggestion:

A SYNAGOGUE UP TO DATE.

At the present time, amid the multitude of different movements for the promotion of the moral and intellectual progress of our species, conducted as they may be in England and America with perfect freedom, a place of worship might be opened in London by Jews with the avowed object of setting forth to those who might desire to come of their own free will, the conception of God, of worship, and of moral responsibility, which the people of Israel have maintained during a period of three thousand years. Is it nothing to tell men what has been the faith even of a single group of their fellows during so vast a period? A faith which has sustained itself through the deepest human experiences of adversity, of sorrow, and of persecution—has not that faith something to testify? Is experience nothing? And what shall we say of the long, tragic, human story of love, of death, and of tribulation? Are these not the common property of mankind? What problem more catholic in its human interest than these?

IN LONDON AND NEW YORK.

Congregations could assemble in London and New York, composed of persons of Christian birth who are unattached to any one of the Christian communions. The time seems to have arrived when there might be an independent Theistic movement—independent in the sense that it would be neither bound by the ritual of Judaism nor be identical with Christian Unitarianism.

It may be that there are few in number among Jewish congregations who are so constituted as to render them qualified to undertake this mission. One of the most essential conditions of such a Jewish reformer must be a very high development of wide human sympathy. Such a qualification would stand only next to that of intense and all-absorbing faith in the religion he has to teach. In the first instance such a movement would depend primarily on the personality of those who initiated it.

WANTED, A JEWISH WESLEY.

Nothing less than the fire and the spiritual genius of a Wesley, a Baxter, or a Mendelssohn would assure the success of the first steps to the foundation of a Jewish, English, Theistic Church. On the other hand, men of less scholarship than any of these might lay the seeds of such a movement, but they must be men of no less strength of conviction and purity of purpose. Whilst the mention of such a movement may awaken the sneers of a pessimist, it is not impossible that it may be more practicable in the near future than any far-reaching reform within the Jewish body itself. And if Jewish reform were to take this direction during the present generation, it may after all be the strongest act possible to justify the claims of Higher Judaism.

There might be some hope of Mr. Simon's suggestion being adopted if the claims of Higher Judaism were not continually thwarted by the existence of so many of the lower Judaists. With Mr. Simon no religious man can fail to be in hearty sympathy, no matter how much he may dissent from his creed; but the last place in the world where Mr. Simon will find support and encouragement is among the well-fed, cynical Sadducees who base upon the most spiritual of creeds a life that is from first to last consecrated to the attainment of material ideals of comfort. Mr. Simon is a *vox in solitudine clamantis*, but possibly his plaintive plea may wake echoes in unlikely quarters.

How Men make Women Unwomanly.

MRS. FAWCETT writing in the *Humanitarian* for July upon "Politics in the Home," turns the tables upon those adversaries of woman's emancipation who maintain that voting once in six years in an election would destroy the womanliness of the woman, by calling attention to the way in which that fell result is brought about by those who repudiate with scorn any sympathy with woman's rights. She says:—

Let me give an example from the present attitude of many women of fashion to field sports, to show how much the true womanliness of woman is marred by their too much deferring to the masculine taste for these things instead of being swayed by their own feminine instincts. What can be more repulsive to the mercy, pity, peace, and love of true womanhood, than to take part in the slaughter of gentle and beautiful creatures, or to stand by as spectators and take pleasure in seeing other people slaughtering them? Yet in the society of many country houses the whole interest and occupation of the men is entirely concentrated in killing deer, or game, or fish; they occupy themselves with it all day, and talk about it all night; the women in the same society have not the courage to resist the force of the stream of public opinion, as it were, on these subjects. A lady in such a house who dared to say she didn't care how many stags had been shot, and would have preferred it if none had been shot at all, would be looked upon not merely as eccentric but extremely disagreeable. She would have to endure a good deal of mild martyrdom. Accordingly we find in too many instances that the women yield their womanly instinct of preservation to the manly instinct of destruction; they go in parties to places where they can see the deer drive, or the partridges and pheasants shot. Most horrible of all, they go, or used to go, in troops to Hurlingham to see tame pigeons shot as they were let out of a trap. This is the sort of un-womanliness which the present system produces. Let us all work with a will for the strengthening of everything that will make such conduct disreputable, that will lift up and sustain the true womanliness that loves to soothe and heal, not to destroy.

Lady Jeune as a Prophetess.

WRITING in the *Pall Mall Magazine* for July, on English Society, Lady Jeune concludes her article with a prophecy of things to come:—

Taxation is increasing, rents are falling, and the foreigner has robbed the English inventor of his earnings; on every hand the demands of the working classes for higher wages and shorter hours are louder, and among the masses, in whose hands is the government of the country, the feeling is fast gaining ground, that of what the rich have they should get their share. These are the facts we have to face, and the crisis has to be tided over; and it can only be overcome in one way, and that is, by a reduction in individual expenditure and a general lowering of the standard of luxury and style of living which now prevails. It will not alter our lives or make them less pleasant in reality; but we shall live much more simply, and our expenditure will probably be half what it is now. London will be as full, and society as pleasant, and there will always be a certain number of wealthy people, who will continue to enjoy the luxury and splendour we now see all around us. But the majority of people in society, having made up their minds that the universal competition which formerly existed is no longer possible, and that they must cut their coat according to their cloth, will return to the simple habits of former days, which need not, however, deprive their lives of all the refinements and beauty of to-day; and in the new state of things, the simplicity and self-restraint they must exercise will restore some of the characteristics of our race, which for a time we have laid aside, the resumption of which will make us more worthy of the traditions which we have inherited from our predecessors.

PROFESSOR HUXLEY AMONG THE PROPHETS.

MRS. BESANT ON THIS "DANIEL COME TO JUDGMENT."

In *Lucifer* for June 15 Mrs. Besant indulges in a very natural pean of exultation over Professor Huxley's lecture on "Evolution and Ethics." She says:—

One of the clearest and most emphatic pronouncements that I have ever read against the application of the principle of the Survival of the Fittest to the evolution of man comes from Dr. Huxley. One of the most mischievous of modern science to ethics has been the argument that, as evolution has proceeded by the struggle for existence and the survival of the fittest, therefore society should remain fiercely competitive, and the conditions of struggle should not be relaxed lest the race should degenerate instead of advancing.

DAWIN'S THEORY.

Charles Darwin wrote me in 1877 that he took that view of life-conditions as affecting man, and that he was regretfully compelled to disapprove all efforts to diminish the struggle for life, since that struggle was the condition of future progress. By it progress in the past had been made; on it progress in the future must depend; and he regarded as shortsighted every attempt to lessen the severity of the struggle, as such attempts preserved the unfit, who would otherwise be killed out. Despite my admiration in those days for scientific theory, I always strenuously combated this conclusion, maintaining that the "fittest" for survival under such a struggle were not the "fittest" for human society; that they were strong unscrupulous fighters, not helpful, conscientious, compassionate human beings. Dr. Huxley, whose position in the scientific world makes his words on such a matter as this of unique importance, has spoken very definitely in this sense.

PROGRESS CONDITIONS FOR MEN AND ANIMALS.

His words sound as an echo of those of a master, who declared that the struggle for existence was the law of progress for the brute, but the practice of self-sacrifice was the law of progress for the man.

If this reversal of progress-conditions be true, there must be some essential factor in man's progress other than those which enter into that of the brute. And since the struggle for existence is the law of progress for all non-human things, and since it is by struggle that all physical qualities are brought to their highest perfection, the element in man which improves and develops by the very opposite course cannot be physical in its nature, nor under the law of physical evolution. Thus we are led to the conclusion that there must be a non-physical—i.e., spiritual—element actively present in man; and that it is the evolution of this which differentiates him from the brute, and makes necessary for his evolution as man the reversal of the animal conditions of progress. The student of the Esoteric Philosophy will see how this teaching of Dr. Huxley's is but another presentment—perhaps an unconscious one—of the two curves, descending and ascending, of the great arc of evolution. What wonder that the method of evolution should change when the midmost point is passed, and when spirit, beginning its upward climb, impressing the law of its own life on its most evolved products, teaches man that, for the growth of the spiritual side of his nature, he must associate himself voluntarily with that law of sacrifice which had been forced on the less-evolved as the condition of their material growth. From the mineral, the vegetable, the animal, sacrifice is extorted; from man it is asked as a free gift. And his glory lies in the giving, the perfecting of his life in its surrender.

THE FUTURE OF THE UNIVERSE.

Then, turning to the dreary prospect of Professor Huxley as to the possible downward route of the race, Mrs. Besant says:—

This is the spectre that stares at man with glassy eyes from out the far-off future. This the grin of mockery that the cosmic death's head shows. O man! child of the dust, evolved through plant and brute into sage and hero, look forth and see thy doom. By sons of persistent effort, by pain and grief, tear-stained and blood-stained, thou hast won thy way.

Thou hast toiled and wrought—for this. Thou hast agonised and died—for this. Thou hast poured out thy blood as water—for this. Thou hast fought, hast endured, hast been martyred, hast triumphed finally—for this. Out of the mud, into the mud. Why ascend so high at cost of bitter pain, only to sink again to the point from which we rose?

Not such the evolution of the Esoteric Wisdom—not such, for us, the message of the radiant future. Flames, sprung from the Eternal Light, and soaring upward to our source, encased in matter, as the starry diamond in the mine, but working through it, penetrating it with our subtle essence, from stone to plant, from plant to animal, from animal to man. And then? climbing upward, with toil and effort, from stage to stage in man, gathering experience, accumulating knowledge, till the infant soul has reached the stature of the perfect man. And then? resting awhile on the platform gained, and then forward again, builder of new worlds, architect of a new cosmos, all the experience of the past wrought into the power of the future. A world frozen or burned? Let it go! there are other worlds. Man lives by spirit, not by a world of matter; let a universe breathe away its life—it lived but for the evolution of the soul.

A Biographer's Advice to Biographers.

LETTERS from Mr. James Parton are published in *McClure's Magazine* for June. Writing to a friend who had undertaken to write the life of Roscoe Conkling, Mr. Parton says:—

The great charm of all biography is the truth, told simply, directly, boldly, charitably. But this is also the great difficulty. A human life is long. A human character is complicated. It is often inconsistent with itself, and it requires nice judgment to proportion it in such a way as to make the book really correspond with the man, and make the same impression upon the reader that the man did upon those who knew him best. Your difficulty will be to present fairly his less favourable side; but upon this depends all the value, and much of the interest of the work. My great rules are: (1) To know the subject thoroughly myself; (2) To index fully all the knowledge in existence relating to it; (3) To determine beforehand where I will be brief, where expand, and how much space I can afford to each part; (4) To work slowly and finish as I go; (5) To avoid eulogy and apology and let the facts have their natural weight; (6) To hold back nothing which the reader has a right to know. I have generally had the great advantage of loving my subjects warmly, and I do not believe we can do justice to any human creature unless we love him.

Why not Kill Consumptives at Once?

In the *Medical Magazine* for June, Dr. Goodhart replies vigorously to the latest proposal for the notation and torture of the consumptives, brought forward by Dr. Arnold Chaplin in the May number. This advocate of State control insisted on—

1. Notification of every case of phthisis.
2. Prevention of patients with actual phthisis, or, indeed, with strong hereditary predisposition, from marrying.
3. Prohibition of patients with actual phthisis from frequenting churches, theatres, railway-carriages, tramcars, or any public places.
4. Disinfection of sputa, habitations, and all things coming in contact with phthical patients.
5. Isolation of the consumptive.

Dr. Goodhart says:—

The writer I am quoting sees very clearly what this means, for further on he proceeds to say that "if all these rules are faithfully carried out, it will entail social exile from friends, home, and all that he holds most dear, etc.

But would it not be more merciful to poleaxe the consumptive *sans phrase*?

EMPERESS EUGENIE AND PROSPER MERIMEE.

SIDE LIGHTS ON THE HISTORY OF THE THIRD EMPIRE.

IN both the June numbers of the *Revue des Deux Mondes*, M. Filon continues and concludes his interesting account of "Prosper Mérimée," which will prove chiefly attractive to English readers from the side light it throws on many, hitherto little known corners of modern history. Thus, the picture given of the Empress Eugénie is delightful, and was evidently written without any thought of publicity, for almost every day M. Mérimée wrote to his friend Madame de Montijo giving her news of her daughter, much as might any other old gentleman of a young bride who had always remained to him the little girl whom he had scolded and amused, and to whom he had taught her letters in the long ago; for it was he who actually first instilled into the Empress Eugénie the rudiments of the language of the people over whom she was later called to reign. "And now," he says, "I also have to call her Your Majesty!" "I cannot help telling you," he remarks in another of his letters, "how well and thoroughly she understands her duties." Once when he went in to see her during the short Regency which occurred while Napoleon III. was contributing to the making of a free Italy, he found her learning the Constitution by heart. On another occasion, immediately after the Imperial couple had had a bomb thrown at them, Mérimée records that the Empress said to those who ran to her assistance, "Do not trouble about us; this is part of our work; rather look after the injured." And yet Mérimée was anything but a courtier, and did not hesitate to blame and criticise what he thought objectionable in the Imperial Court when writing to Madame de Montijo, and many times he refused official positions pressed upon him by the Empress because he wished to keep his entire liberty of thought and action.

MÉRIMÉE'S ENGLISH FRIENDS.

M. Filon touches, but with considerable discretion, on the Don Juanesque side of Mérimée's life and character, and it is easy to see that the great author's friendships were far more to him than his loves, although like most men he was not sorry to have it thought that he was much favoured by the fair sex. He was one of the few Frenchmen who thoroughly appreciated and admired Englishwomen, and his greatest delight was to come and occasionally spend a few weeks in London, where he was a welcome guest at Holland House, and where among others he could boast of the friendship of the beautiful Mrs. Senior, Carlyle's Lady Ashburton, and of Panizzi's, who had then made his home in England; indeed, most of the literary lights of the London world of that day were fond of Mérimée. In the August of 1865 we learn he spent three days with the Gladstones, and the Frenchman's criticism of the G.O.M. cannot but be read to-day with interest: "Mr. Gladstone seemed to me under some aspects to be a man of genius, under others a child"; then he continues, "there is something in him of the child, of the statesman and of the madman."

ON THE EVE OF SEDAN.

But when the Franco-German war broke out Mérimée's happy days were over. Long before 1870 he had seen the cloud coming on the horizon; his letters to Madame de Montijo became sad and discontented, and he complained that at the Tuileries everything seemed to him changed save the Empress. He observed that too many banquets took place; that there were too many Germans about; and too little dignity. "If you had a pack of hounds," he writes to his old friend, "would you care to see the dogs fighting among themselves instead of pursuing the game? If you discovered in the pack certain animals who had

neither scent nor courage, would you keep them? If you sent away those who served you faithfully and replaced them by others that had bitten you, do you think it would encourage the best among them to serve you honestly?" A terrible comment on Napoleon III. and his familiars!

As early as the year 1865 Mérimée had taken Bismarck's measure, for he was at Biarritz when the latter came there to see the Emperor; and years later when he heard of the German candidature to the Spanish throne, he wrote to Panizzi, "If there is war it will be because M. de Bismarck has made up his mind to it."

AFTER THE CRASH.

Although his friends urged him to leave Paris after the battle of Weissenburg he would not do so. On the ninth of the August of that year, although very ill he managed to crawl to the Tuileries and saw the Empress. "She is as firm as a rock," he wrote to Panizzi, "although she is fully aware of the horror of her situation. She tells me that she never feels fatigue; if all the world had her courage the country would be saved." But on the last occasion that he saw his Imperial mistress he records that she said to him, "I hope that my son will have no ambition, and that he will live happily in obscurity." On September 8th Mérimée was at last persuaded to leave Paris for Cannes, and from there he wrote with infinite difficulty, for he was even then dying, a pathetic letter to Panizzi begging him to seek out and care for the Empress, who had at last reached the hospitable shores of England; and so his life ended at its saddest, for Prosper Mérimée died on September 27th, 1870, and is buried in the cemetery at Cannes, where his grave is unmarked by slab or cross.

Politicians and their Caricaturists.

In the *Strand* there is an illustrated interview with Mr. Furniss, in which the famous caricaturist gossips pleasantly as to his experiences. He says Mr. Morley is the most difficult of all statesmen to caricature; he will look a boy, a young man, and an old man, all in the course of an hour. Mr. Asquith is also difficult, and Sir Richard Temple the easiest. Mr. Gladstone, however, is the most wonderful man for the caricaturist, and one of the finest:—

I have sat and watched the rose in his coat droop and fade, his hair become dishevelled with excitement, and his tie get round to the back of his neck.

The interviewer at this point asked Mr. Furniss what the wives of his subjects thought of him. He replied:—

"Oh! I get most abusive letters from both sides. Wives of members write and ask me not to caricature their husbands. One lady wrote to me the other day, and said if I would persist in caricaturing her husband, would I put him in a more fashionable coat? Now, this particular member is noted for the old-fashioned cut of the coats he wears. Another asked me to make the sharer of her joys and sorrows better looking; whilst only last week a lady—the wife of a particularly well-known M.P.—addressed a most plaintive letter to me, saying that since some of the younger members of her family had contrived to see my pictures they had become quite rude to their papa!

"Why members often ask me to caricature them. One member was very kindly disposed to me, and suggested that I should keep my eye on him. I did. Yet he cut me dead when he saw his picture! It's so discouraging, don't you know, when you are so anxious to oblige."

I asked Mr. Furniss if he thought there was anything suggestive of cruelty in caricature.

"Not in this country," he replied; "in Spain, Italy, and France—yes. Caricaturists there score off their cruelty."

HOW TO MAKE SCHOOL INTERESTING.

HINTS FROM AN AMERICAN TEACHER.

In the *Forum* for May Dr. J. Rice publishes a paper, written by Miss Arnold, describing how she has succeeded in making education popular among the children of Minneapolis. As her paper contains hints that may be useful to teachers in the old country, I gladly quote it:—

"My purpose in introducing the Science and Literature lessons was to lead the children to observe, to bring them into closer touch with nature, to add to their enjoyment in and out of school (an 'inalienable right') and to fill their minds with beautiful pictures and inspiring ideals so that there might be less room for the mean and low. Material for language lessons, knowledge of facts, and greater power of expression were ends obtained through the lessons, but they were not the most important aims.

OBSERVATION LESSONS.

"The observation lessons are actual observations from specimens. The work has thus far been confined to observation of plants and animals, because the teachers themselves still feel the need of instruction in these branches, so that we have not as yet been able to cover a broader field. The time given to the work covers eight weeks of plant lessons and six for animal lessons in the spring, with equal periods in the fall.

"These lessons occur at the first morning period, and the other work of the day is related to them. If the Indian corn is studied, the story of Hiawatha's wrestling with Mondamin may be read, Whittier's 'Corn Song' committed to memory, or the history of the plant as related to agriculture may be noted. The golden-rod and aster suggest Helen Jackson's 'September,' or 'October's Bright Blue Weather.' The animal lessons follow the plant lessons in the fall and precede them in the spring. Living specimens are observed as far as possible. It is not uncommon to find in the schoolroom doves, gophers, squirrels, rabbits, kittens or mice in cages, fed and cared for by the children. I said to some primary children in a room where I had found a basket of white rabbits, 'Wouldn't it be better to have a picture of a rabbit for your lesson?' 'Oh, no! you couldn't see it run, or eat, or breathe, or drink, or feel its soft hair, or see its teeth.' 'And we couldn't take care of it,' added another.

WINDOWS INTO THE INFINITE.

"My hope in introducing the lessons was that the children from homes where poverty or heredity had made their lives barren might have a taste of the beautiful and learn to love nature. I have been delighted with the results. Bootblacks stop me in the street to tell me what beautiful flowers they had studied in the school that day. A little lad followed for several blocks the car in which he saw me to speak to me when I left the car, and show me some lilac buds that he was cherishing. A ragged newsboy accosted me on the street with, 'Did you get that letter I wrote you about the Bloodroot? We had some in our school. They were awful pretty, so white, but their petals all fell off and their roots are like blood. Say, I know where they grow.' I have seen the ill-kept children from tenement houses crowding around the table on which the flowers stood, writing their entry in their notebooks as to petals, stamens, or leaf. One little class of Russians and Bohemians learned to read through science lessons alone. They were alive with enthusiasm. Who can tell what this glimpse of the beautiful will be in their lives—a window into the Infinite?

THE USES OF POETRY.

"The same results in enthusiasm and inspiration were reached through the Literature lessons. The time not spent in observation lessons in the winter has been given to poems, fables, and stories. Little children become friends with the 'Village Blacksmith,' with 'Paul Revere,' with 'Hiawatha.' In one school where the children from the flats by the riverbank meet the children from comfortable homes, the little seven-year-olds recited whole pages of 'Hiawatha,' and at the teacher's request played the part of Hiawatha, Nokomis, or the 'Deer with Antlers.' I shall never forget how those

children forgot themselves and their visitors in living Hiawatha's life with him, listening to the 'whispering of the pine trees,' to the 'lapping of the water, sounds of music, words of wonder.' One little Norwegian, who had just come to our shores with no knowledge of English, enacted the 'Deer with Antlers,' stamped with all his hoofs together and fell limp and lifeless at the touch of little Hiawatha's arrow. In another room where the children hear no English at home the teacher read stanzas from Longfellow with the refrain,

"A boy's will is the wind's will,

And the thoughts of youth are long, long thoughts."

'Those are all you will understand,' she said, closing the book. 'Oh, please read us the rest even if we don't understand,' they pleaded, delighted with the rhythm and the beauty which they felt even if they could not interpret.

A DOOR INTO A NEW LIFE.

"The third grade boys from a school in the centre of the city where the immigrants of several nationalities seem to drift wrote to me to beg longer time to read what Mr. Whittier had written. Their teacher said they begged over and over again for 'Snow Bound,' and she found phrases from the poem drifting into their language lessons. These children live in dismal homes at the best. Their doors open on the street. Beautiful to hear them, with grimy hands clasped and dark eyes luminous, repeat Lowell's 'First Snow-Fall,' or Wordsworth's 'We Are Seven.' The poet within them responds to the soul of the poem and o'erleaps their barren environment. These lessons open the door to new life."

Women as Gardeners.

MISS MAGGIE BRAINARD, in the *Californian* for May, has an interesting little article concerning "Women in Commercial Horticulture." Miss Brainard has a large orchard in the fruit belt of the central Mississippi. She does a good business by shipping violets, daffodils, and jessamine to the northern states. Another Mississippi lady makes a good thing by shipping rosebuds in water, so that they are as beautiful and fresh on arrival as when first picked. A third southern lady makes a speciality of camelias; some of her flowers bring as much as 1s. and 1s. 3d. apiece. One Californian lady, left a widow with four little boys, from eight years to two, has found a competence in a fruit farm of thirty-six acres, on which she raises prunes, cherries and apricots; she does all her own pruning, and has never had a foreman. Another lady has two orchards, one of ten, and another of twelve acres, from which she sells apricots and cherries to the value of £1,000 a year; her cucumbers bring 4s. a dozen. Another widow in California, once a reigning belle of the town, is the head of a cut flower industry. She has seven acres of chrysanthemums, and twenty of violets; this year she has 18,000 chrysanthemums in bloom.

Mind Measurements.

THERE is an article in the *Philosophic Review* of Boston for May on "Mental Measurements," by Prof. Cotell. There are many good points in the paper that are interesting, especially those in which he deals with the measurement of the time required for perception, movement, and thought. Colour is not seen unless it is at least one-hundredth of a second on the retina; one-tenth of a second gives the maximum impression with which the intensity declines; it takes about one-tenth of a second for the pain of burning to be communicated from the hand to the brain, and for the hand to be withdrawn; it takes about a quarter of a second to translate words into a familiar foreign language; half a second to multiply the numbers of the multiplication table; three-quarters of a second is the interval of time which can be most accurately conceived.

ICE LAID ON LIKE GAS!

THE LATEST AMERICAN NOTION.

THE *Engineering Magazine* for April has an interesting article describing the latest development that has been made by the citizens of the United States in the associated supply of the luxuries of life. In even the most backward community, water is laid on in pipes to every house. Gas was the next thing to be supplied from a common centre; then came hot air, hot-water, electricity, and oxygen; all of which are supplied to the household by companies which deliver all these commodities, as they are wanted, to the individual householder, by a service under his control. The latest advance in this direction is the supply of ice.

HOW IT IS DONE.

Of course ice is not delivered in bulk. What is done is that a central refrigerating system is established, by which, instead of delivering cold, the company abstract heat. A pipe is laid into every house, which is supplied with anhydrous ammonia from central reservoirs, and by its means anything can be frozen, and ice manufactured in every kitchen.

The following account of the applications of this latest appliance of civilisation will be read with interest, although in this country we do not suffer so much from heat as to render it a necessity of life as it is in Denver and St. Louis:—

The pipe-line system is elastic and admits of a wide number of applications. The bulk of the work so far performed by it is to take care of the regular storage-box for hotels, restaurants, saloons, butchers, butter, and commission houses, etc.

ICE MADE WHEN WANTED.

The principal hotels and restaurants and down-town butcher-shops in St. Louis and Denver are using this system in their storage-boxes. But the applications of the system do not end here. In many hotels, cafés, and saloons, ice is required for water-pitchers and to crack up for mixing beverages. In such cases a miniature brine-tank is provided, through which the expansion coils connecting with the pipe-line are run. Moulds of suitable size are placed in the brine, and the operation of ice-making is carried on just as at the large ice-factory. Where small amounts of ice are needed for cracking-up, a small insulated reservoir is provided, and the expansion pipes are placed close to the sides. Water is then poured into the reservoir, and ice forms on the expansion coils and extends towards the centre of the reservoir until a solid mass is frozen. This is chipped out as desired, and new water added from time to time.

WATER ALWAYS COLD.

Another important branch of the business is supplying cold-water for large stores, factories, and offices. The installation for this service consists of a water-tight insulated tank, having at the bottom a coil through which the hydrant water is passed on its way to the taps. About a foot of water is poured in on top of this coil, and just underneath the surface of this water the expansion pipes are placed. A sheet of ice five or six inches thick is formed by the action of the expansion coil, thus keeping the water coils constantly surrounded with ice-water of low temperature. The city water so cooled may be then carried by insulated piping to taps in any portion of the building. The cooling of soda-water fountains is effected in the same way. The manufacture of ice-cream is also more easily accomplished by the aid of this system. Other branches of business are also supplied, as the manufacture of perfumes and chocolate confections.

COOLING ROOMS.

Among the luxuries furnished by this system may be mentioned the cooling of living-rooms, which, in such a climate as that of St. Louis, proves a great luxury. The refrigerating company there started in with contracts to reduce the tempera-

ture of cafés and dining-rooms twenty degrees below the outside temperature. No difficulty was found in cheaply reducing the temperature even to a lower point than this, but sanitary considerations, and the comfort of the frequenters of such places, determined that a difference of from ten to fifteen degrees between the inside and the outside temperature was the most satisfactory. It is interesting to note that the same piping used for the ammonia cooling service in the summer is used for steam heating purposes in the winter.

Americans consume so much more ice than Englishmen, it is doubtful whether a refrigeration system would pay in London. In St. Louis they maintain that each line of mains yields £1,400 per annum, but an inquiry conducted in these cities shows that the annual demand for ice at £1 per ton amounts from £1,600 to £2,400 per mile of street.

What Australia Wants.

THE Secretary of the Pastoralists' Society liberates his mind in the April number of the *Engineering Magazine* of New York as to the needs of Australia. The article gives a vivid and illustrated description of the disputes between Labour and Capital which have convulsed the Colonies at the Antipodes, and concludes as follows:—

What these colonies want are population and capital; yet we find an utterly selfish growth of trade-unionism doing its utmost to check the inflow of both. "Australia for the Australians!" shout the men who are deliberately allowing harvests of untold wealth at their doors to lie ungarnered. If only the colonial governments would throw aside the last vestige of fear of the Trades' Halls; if only politicians could be found who would think more of the country's development than of the voters in their particular metropolitan constituencies; if only a race of statesmen were to arise who would resolutely burst up the city populations and take measures to pour a steady stream of immigration upon the soil,—then the progress of the Australias would amaze the whole civilized world. Perhaps the sovereign remedy will be found in Federation, which may give us, instead of half a dozen insignificant and time-serving legislatures, one thoroughly disinterested and representative Parliament, to whose service men of honour, education, and enlightenment, who too often shrink from contact with present parliamentary methods, will devote their lives.

Have Men more Brains than Women?

IN the *Young Woman* for April there is an interview with Mrs. Fenwick Miller, who discourses concerning marriage and public work, the condition of modern society, the progress of woman movement, and woman's suffrage. In the course of the conversation, Mrs. Fenwick Miller, describing the Woman's Congress, held three years ago, tells the story of how an old-time and honoured fallacy was exploded:—

A very clever address was read on the weight of women's brains. We are always told in anatomical books that the weight of a woman's brain is four ounces less than a man's, and the inference drawn is that a woman is four ounces less capable of thinking than a man. This lady, in preparing her paper for the last Congress, endeavoured to hunt that statement to its lair. She went to one professor after another to discover who had originated it, without success. All the leading anatomists told her that it was so; but when asked how they knew it, not one had any reference to give her. Finally, she prepared twenty brains, ten men's, ten women's, and offered a large reward to any anatomist who, after testing those brains anyhow he liked, could tell her which were the women's and which the men's. The brains were so much alike that it was perfectly impossible to tell to which sex they had belonged. No doubt the entire brain of an average woman is lighter than that of a man, because she has less muscular surface to move.

SOME SOCIALIST LEADERS.

PEN PICTURES BY M. DE WYZEWA.

The following accounts of some of the leading Socialists who were conspicuous on Labour Day will not be without interest. They are taken by the *London Quarterly Review* from M. de Wyzewa's book:—

WILLIAM MORRIS, POET AND SOCIALIST.

Among the English Socialists, the best account is given of Mr. William Morris. He says:—

On the pavement, with his head uncovered, I saw a solid little man vociferating and gesticulating in the wildest way. He seemed to be a man of fifty, with a crimson countenance, from which there shone the light of two large steel-blue eyes. Incapable of standing still, he marched about incessantly. The abundance of his gestures shook his frame from top to toe; his black hair, like a mane, flowed to and fro; and all the time he brandished in the air, or ground between his teeth, a deeply-coloured little wooden pipe. With all the force of his strong lungs, and in the affected tone which Englishmen assume when speaking in the open air, this improvised apostle was demonstrating, not, as might have been expected, the advantage of coming to Christ and the inconveniences of damnation, but the necessity of a class struggle, and the certainty of social revolution. "O, Hamlet, what a falling off was there!" The energetic orator to whom we have been listening is the author of "The Earthly Paradise," and the self-rejected poet laureate to the English crown. Poet or no poet, the little man was causing an obstruction, and, refusing to desist, off he was marched to the station-house, still vociferating and still brandishing his pipe. Mr. Morris shows no signs of recantation. His zeal in writing, lecturing, agitating knows no bounds. No means are too laborious or humiliating for diffusing his ideas. Now you see him spending weeks together in the wilds of Scotland, stirring up the people to revolt against the owners of the soil; now you see him standing at the corners of the streets in London trying to convert the passers-by; now handing leaflets and prospectuses to the crowds of passengers at railway stations or inside the cars. In his home at Hammersmith he holds meetings for the workmen of the district.

A GERMAN SOCIALIST LOYOLA.

Of the German leaders, the most interesting account is of Von Vollmar. M. de Wyzewa says:—

Vollmar—for the moment we may drop the "Von"—is, as this prefix indicates, an aristocrat. He was born at Munich in 1850, and belongs to one of the oldest families in Bavaria. Until his fifteenth year he was in the hands of the Augsburg Benedictine Fathers, who gave him an education suited to his station. In 1865 he entered a cavalry regiment, and the year following went through the Austrian campaign. Not content with the life of an officer in time of peace he gave up his commission and offered his sword to the Pope, who was at that time recruiting volunteers. It was not until 1870 that he rejoined the Bavarian army to take part in the Franco-German war. While passing through the region of the Loire, at the head of a telegraph corps, the young man was severely wounded. In his efforts to complete his task he fell and broke both legs. The fracture, complicated with a lesion of the spine, left him a cripple for life. He was then but twenty-one, and never since that time has he been able to move without crutches. The least step still costs a painful effort to his crooked limbs. With indomitable energy, however, Vollmar set himself, through the long years of his convalescence, to complete his early education. There is not a science or an art he has not approached. There is not a language in Europe he cannot speak. The most important result of his studies, however, was his conversion from Catholicism to Socialism. When Vollmar left the military hospital he was an ardent follower of Marx.

THE FOUNDER OF LABOUR DAY.

M. Guesde, the Frenchman, is the originator of the May-Day Labour Demonstration.

When M. de Wyzewa saw him first, about ten years ago, M. Guesde was addressing an audience in a small provincial theatre.

"On entering, I saw upon the stage a great big devil, black-bearded, hairy, vociferating without modulation, grinding out his words with teeth and arms as if he were a mere machine. No fine phrases, no high-sounding talk about ideal justice or the rights of labour, no appeal to sentiment; the only appeal was to the needs, the instincts, and the appetites of the audience."

More recently M. Wyzewa has had the opportunity of seeing the great agitator in his home in Paris. He is still in his prime, and his thick black beard retains its raven gloss. In his own house you see him to advantage, and find out almost immediately the secret of his power. He is a "magnetic" man, and "one of the most extraordinary chamber orators of the time. He is not a man; he is a machine, an intellectual machine, an automatic dialectician, a sort of animated marionette wound up once for all." He is also one of the most disinterested of men. "He knows neither ambition nor jealousy, nor passion for gain. He is not even an *exalté*. And yet in spite of poverty and calumny and sickness and imprisonment, he has pursued his propaganda, and for twenty years has acted as a chief of French Collectivism."

THE EDITOR OF THE "REVUE SOCIALISTE."

M. Guesde is for revolution and violent overturn, but the other eminent Socialist leader in France advocates more of the Fabian policy:—

M. Malon, after many fluctuations, preaches patience, and, in place of revolution, advocates reform. He was born of peasant parents at Prétient in 1841. At first he was a shepherd, but he afterwards obtained employment in Paris as a dyer. There he studied science, got up strikes, and made his mark among the Socialists. His leisure was devoted to poetry. During the closing years of the Empire he became one of the chiefs of Socialism, took a prominent part in the agitations of the famous "International," was often sent to prison, became successively a deputy and a member of the Commune, and, on his banishment from Paris, spent some time with Bakounine in Switzerland and Italy. After the amnesty he returned to Paris, founded the *Revue Socialiste*, became the editor of more than one French newspaper, and constituted himself the historian, the expounder, and the populariser of Collectivism.

A Methodist Tribute to a Jesuit.

DR. BOWMAN STEPHENSON, ex-president of the Wesleyan Conference, contributed a glowing description of the Jesuit father, Père Jogues, to the *Sunday Magazine*:—

There glowed in the breasts of the early Jesuits a sincere and absorbing passion for Christ, and for what they believed to be the salvation of souls. Without such a mainspring of action within, a life like that of Isaac Jogues would have been impossible. But the Jesuit, amid the cruel and debased savages of the wilderness, living amongst them, trying to love them, eager to help and uplift them, willing to live for them or to die by their hands, is a heroic figure. To him we should no more refuse our tribute of admiration than to the Patessons, and Moffatts, and Calverts of our Protestant legion of honour. We revolt against the Jesuit's methods; we abjure his superstitions; we marvel at and we condemn the elasticity of his conscience on ethical questions; but we admire his devotion, his courage, his endurance, his love for his religion and his Saviour, for the sake of which he "counted not his life dear unto him." A just judgment will confess that pure and lofty spirits have been found amidst abounding errors of creed and system; that the saints of God are not confined to one Church, but may be discovered in all; and that in the long roll of Christian martyrs none more courageous, more unselfish, more heroic can be named than Isaac Jogues, the Jesuit.

"IMITATE THE ENGLISH, OH YE FRENCH!"

A FRENCH AMBASSADOR'S EXHORTATION.

IN the *Revue des Deux Mondes* of the 1st of May, M. René Millet, who is, by the way, French Minister Plenipotentiary at Stockholm, publishes a noteworthy article on the foreign extension of France. He laments that France should waste her strength in internal strife between political parties, and useless jealousy about the results of the last war, instead of taking her full share in the colonisation of the world. M. Millet is an accomplished scholar, as well as a practical diplomatist, and he rises into eloquence when he analyses the historic elements of France, the old provinces, so different in race and in genius from Brittany to Provence, and also when describing the place occupied in the Roman Empire by the Mediterranean Sea. The great lovely lake, dominated by the mountains of Spain and the Italian Riviera, by fabled Olympus and Atlas, besprent with islands, and partially closed in by the Gates of Hercules, was to the peoples of antiquity a common possession, "and in disputing among themselves for portions of the domain, its integrity remained unbroken. For them the words Europe, Africa, and Asia, meant not so much distinct continents as the opposite shores of the great central lake. At one epoch Rome based a great political system on this natural conformation, and soldered together all the parts of a vast circle of which every ray converged upon the Mediterranean Sea. To a Roman citizen of the age of Augustus the African coast was as familiar as a suburb of the city. For a contemporary of Constantine, Asia Minor, the granary of men, was a portion of Europe prolonging towards the East. Our 'heavy ancestors' changed all that. They kept up their little Courts in splendour, while the Arab overran the shores of the inland sea, and Europe practically ended at Roncesvalles." Even the Crusaders perished miserably across its waters; St. Louis died at Carthage, where France preserved from age to age the sacred ground on which he lay; while all the noble shores of the suburb of Rome became the heritage of the Mussulman, and Algiers was a nest of pirates in the hands of the Unspeakable Turk. At the very time when Columbus was discovering America, the nations of Europe were unable to secure order on their own great lake, and Genoa and Venice had to sustain constant warfare between the Crescent and the Cross.

In modern politics M. René Millet laments the incessant and bloody quarrels concerning artificial frontiers. Why regard Belgium as a theft from France, he argues, or bleed to death upon the banks of the Rhine? The nations of Continental Europe are still, he says, encased in their "feudal armour." Look at England, who when once she had renounced any pretensions to "France and Navarre" plunged across the seas, planting in new lands her children, her commerce, her laws, her ideas. In the crisis of her fate, when the Continental blockade had destroyed her commerce, England remembered that she was still the Queen of the Seas. Painfully victorious at Waterloo, her treasury was empty, but she possessed Malta, and was established at the Cape; she fortified her Indian possessions, and found in Australia a compensation for the American colonies which she had failed to keep. Of the present state and future chances of France, M. Millet draws a very hopeful picture. Far from her being a country ruined by the breakdown of an older form of civilisation, he describes the railways as gradually penetrating into every corner of the old provinces. "On every side on which I look," says this trained servant of the State, "I see a country

full of sap in full movement, and consequently a still young nation, if I date its virility from the day on which it arrived at the knowledge of its own powers. Even in the faults of France, which show more of inexperience than of discouragement, I find it impossible to perceive those symptoms of decrepitude which melancholy minds seem almost pleased to discover. This is the primary quarrel between the past and the present, which must be settled before we can get further in our argument. The political pessimists are wise to remain at home and admire their own wisdom. Simple souls with less book-learning and more faith will always pass across their bodies to the future goal."

HOW FRENCH CONVICTS LIVE.

IN the *Revue des Deux Mondes* of the 15th of May M. Mimande gives a most interesting account of the French convict settlement in New Caledonia, the result of a five years' sojourn at La Nouvelle.

M. Mimande is firmly persuaded that even an habitual criminal can be regenerated by hard work and decent family life, and he compares favourably the English convict system with that pursued by the French authorities. Indeed, he declares that before the ordinary criminal passes from the third class, or incorrigibles, to the first class, in which the conditions of life are made fairly tolerable, he must have been capable of more heroic virtue than that attained to by most honest men during the whole course of their lives.

The picture drawn of the convict settlement is gruesome in the extreme, and it is evidently meant to be so. The association of the criminals together results in a moral leprosy of the worst kind, and several instances are given of the decadence of individual men. For example, some years ago a gentleman of good family and excellent position was sent to New Caledonia for arson. At the end of his term he had become a dirty drunkard, passing his life among men addicted to every vice. The Abbé K., an unfortunate priest convicted of having embezzled a charitable fund, took to "tafia," some drug analogous to opium, and with deadened eyes, loose grey hair framing a ghastly face, and a mien both sly and piteous, he now shows no trace of the ecclesiastic once eligible for a bishopric; while a Parisian lawyer, well known in the circles of the drama and finance, may be seen half naked under the torrid sun, pushing a barrow, a double chain riveted about his foot and classed among the incorrigible reprobates, while twice a day he is roughly examined, and his mouth pulled open to be sure that he has concealed no murderous weapon. Such, at least, was Cluquet's state last year.

Alas! what agonies are inflicted and what agonies endured in the name of human justice.

Painful indeed is the recital of an execution in New Caledonia, when one man is picked out among the inhabitants of the condemned cells, and the others are marched out to see him die. The priest is always present, and while the sad company kneel, nay, almost grovel on the ground, the man about to die nearly always finds at the last moment words of resignation, encouragement, and good advice. This strange moral phenomenon has been constantly observed. It seems as if the near approach of death elevated the natural man, and that in the midst of mortal tragedy the criminal becomes wiser and more human than those who have condemned him to a violent death.

Something in the state of the penal colony is surely in woeful need of amendment when the spectator sympathises with the criminal rather than with the judge.

THE GOD OF SCIENCE.

THE LATEST ATTEMPT TO DEFINE DEITY.

THE *Monist*, a quarterly magazine published in Chicago, in the April number has two very interesting and important articles entitled "Religion and Modern Science," by Professor F. Jodl, and a criticism upon the same entitled "The Religion of Science," by Dr. Paul Carus. These two eminent philosophical speculators, both of whom have discarded absolutely the conception of a Divine Father, are not yet able to agree among themselves as to what science should put in the place of the Deity. Professor Jodl is very strong in his repudiation of Nature worship. Man, he maintains, is superior to Nature—looks down upon Nature; and it is essential to the idea of a god that he must be something to which men can look up to. He discusses at length the attempts of the various rationalising Christian schools to reconcile science and religion, and rejects their conclusions as inadequate. Nature, "red in tooth and claw," finishes the question for him. The iron laws and the immeasurable cruelty of Nature seem to him quite irreconcilable with any theistic theory.

PROFESSOR JODL'S DISCOVERIES.

But Professor Jodl, while maintaining that it is impossible to reconcile the historic forms of religion with science, believes that he has discovered the God in whom science must believe, and he sets forth his conclusions in an article of considerable power and unquestionable earnestness. Professor Jodl declares that—

the stumbling-block of the old theological idea of God has become the corner-stone upon which the new scientific conception is built. This strict anthropological conception of God as the ideal which is always newly creating itself in the struggles of humanity, which is no Being but a Becoming, solves the innumerable difficulties which the idea of God has hitherto placed in the way of rigorous scientific knowledge and the construction of a unitary conception of the world.

He says that he cannot find God in Nature, but that he does find God in man, or rather in the Divine Spirit, or that which is highest and best in man, which the Russian peasants call "the spark of God."

THE DAY WHEN GOD WAS BORN.

Nature did not whisper in our ears that in us which is best and highest. That did not come to us from heaven; *we ourselves* won it by hard struggles, by terribly severe, self-imposed discipline. It is not of Nature; it is *above* Nature. Through *us* something has come into the world that before us did not exist—something that the most exuberant creative magic, or Nature's grandest mechanical dreams could never replace. The day on which first a human being pressed his weaker fellow-man to his breast and said, "Brother, not mine, but thy will, be done; I will give up my desires that thou also mayest be glad;" the day on which man first lifted up his head and said, "Let us make the world *good* in the likeness of the picture that has become living in us, just as it should be;" this is the great and sanctified day in the history of our race on earth, the Christmas-day on which God was born. But not as the religious fancy has expressed it, the day on which God became man, but the day on which man began to become God—that is, the day on which he began to feel spiritual powers in his breast that transcended his animal impulses—powers to which the majority of humanity was still as remote as heaven from earth.

IS THIS THE TRUE POINT OF UNION?

Here is the true point of union for Christian dogma and science. Here is the God in which science also may, nay, must believe. Not humanity in its empirical reality, but the ideal world developed within the human realm of things—the spirit of humanity. This is the only true object of worship. Before it we are humiliated, and by it we feel ourselves exalted. From it we receive all the good that life bestows upon

us; it gives us light and peace and lucid thought. And what higher, nobler thing can a life produce than the feeling that it has not been unworthy of this great ancestry, that it has helped to keep alive this holy fire, that it has helped, perhaps to fan by its own life this living flame to greater heights?

Here is the true source of the ideas of accountability and of salvation. We are not responsible to a being outside and above us, but to our own selves and humanity, from which we have received the best that it had to give, and for which we must return what we ourselves have produced.

DR. CARUS'S CRITICISMS.

Dr. Carus criticising this article objects to Professor Jodl's recognition of what may be called the God in Humanity, as if it implied that the same God was not in Nature. Referring to the passage quoted above as to the time when man became divine, he asks whether this evolution of humanity into Deity was not due to a purpose or law working in Nature by which man was evolved. He says:—

Man's reason and also man's morality are not original inventions of his, but the result of many experiences which he had to learn. And the world in which he lives is such that he can acquire reason and morality, and if a being should acquire a wrong kind of reason or a wrong kind of morality, it will by-and-by be blotted out of existence. Accordingly there is a prototype of reason and of morality, and this prototype of the humanity of man is exactly that which in the language of the old religions has received the name "God."

THE REALITY OF GOD.

While admitting that, if Theism means the belief in a personal God, he, the editor, is an atheist indeed, nevertheless he maintains that he rejects atheism because he sees a great and potent truth in the idea of God. He says:—

With Professor Haeckel and Professor Jodl we reject the conception of an anthropomorphic Deity. The anthropomorphic idol is doomed before the tribunal of science. But we see a deeper meaning in the idea of God which has formed through millenniums the very centre of the greatest religions on earth. Science has to recognise the reality of an all-presence in existence which is analogous to that which in a religious language is called God.

GOD THE PROTOTYPE OF THE SOUL.

How then would he define the God in whom science must believe? Dr. Carus sums up his conclusions as follows:—

We agree with Professor Haeckel in his rejection of anthropotheism: God is no supernatural being nor is He a huge world-ego. But we cannot accept his view of God as being only matter and energy. The idea of God is and always has been a moral idea. Thus we have come to regard all those features of nature as divine which condition the origin and existence of morality, and we define God as the authority of moral conduct. This authority is not a person, not a sentient being, let alone a sentimental philanthropist; but it is, nevertheless, a reality, and, indeed, a stern reality.

Such is the God of science. God is that quality of existence through which we originated as feeling, thinking, and aspiring beings. He is the prototype of the human soul, and the condition under which develop man's reason and morality. Obedience to Him is indispensable for a continued existence, for further progress and a higher evolution of the human soul.

It is easy to say that Dr. Carus is a Pantheist and that Professor Jodl is a Positivist, but there is more in their conclusions than is usually asserted in those systems of thought, for both maintain, Dr. Carus even more strongly than Professor Jodl, that moral conception of the Invisible not ourselves which makes for righteousness that long ago found its most comprehensible religious expression in the Bible.

THE BUDDHISTS' HELL.

In the *Californian Magazine* for March Mr. Frederick J. Masters has an illustrated article upon this subject. He gives a description of the Buddhist purgatory, based upon the drawings and models found in the temple of Shing Wong, and especially in the detailed account given in the religious book published at Canton, called "Yuk lik chi po pin." There are ten purgatories, according to the Buddhists, the first of which is the purgatory of suicides, although it also contains wicked priests and nuns who pocketed fees for masses that they never said. They are shut up in dark cells, and compelled to read small type, with only a very little light, those prayers which they have neglected to say during their lives. The second kingdom has sixteen sub-hells, and contains an immense variety of evildoers, including ignorant physicians and quacks, whose malpractices

body. In the fifth kingdom unbelievers in the doctrines of Buddha, and those who stop watercourses and wells, are taken to the top of a pagoda, where they are allowed to see all the happiness which they ever enjoyed, so that they may be able to appreciate the torments to which they are afterwards subjected. Some are sawn asunder, others are roasted in the fire, and others, again, are forced to swallow red-hot pills of iron. In the sixth purgatorial kingdom are to be found men who grumbled against the weather, who are tortured together with dealers and traders in obscene literature, and those who have eaten the flesh of the ox or wasted vegetable food. The neglectful schoolmasters and the disobedient scholars are crushed together under huge rocks. The rewards of the blessed are also given in this paper. The chief reward for an extremely virtuous woman is that she may be born again as a man.

killed their patients, fraudulent trustees, and marriage brokers who made alliances between healthy persons and those who were suffering from an incurable disease. It is interesting to know that extortionate officials are thrust into cages, in which they have not room to move their limbs or to stand upright. After being wheeled through hell in this condition for centuries, they are at last allowed to return to earth in the form of loathsome serpents. The third kingdom has also sixteen compartments, in which are confined saucy wives, busybodies, and others. They endure a variety of torments. The fourth kingdom is devoted to those who use light weights, adulterators of food, niggards who hoarded up specifics which might have saved their neighbours, as well as men who cast refuse, dead animals, and broken glass into the public highways. Thieves, it appears, when their term of punishment has expired, return to earth in the form of beasts, reptiles, and insects. Traders who use light weights and false measures are hung in mid-air with a large hook, which is thrust into the fleshy parts of their

Blackwood's Magazine.

The first paper in *Blackwood's Magazine* is rather an odd one, being devoted to what is called "The Religion of Letters" from 1750 to 1850. It deals with the allusions to religion in the correspondence of Dr. Johnson, Goldsmith, Coleridge, Lamb, Wordsworth, De Quincey, and Miss Austin. There are plenty of literary articles, including an interesting account of a novel by a Jesuit Father, and a notice of "Evenings with Madame Mohl." The paper on the financial conditions and mutual relations of Australia and India, although short, is full of helpful suggestion to those who believe in the importance of maintaining the unity of the empire. One of the most interesting articles is a review of Baron Hyde de Neuville's memoirs. "A Son of the Marshes" has another of his excellent natural history papers. Two papers deal with episodes relating to the romance of history. The political articles are devoted to the Irish constabulary and magistracy of Home Rule. Mrs. Oliphant gashes a little over the Royal marriage.

"BORDERLAND."

CONTENTS OF THE FIRST NUMBER OF THE NEW QUARTERLY.

THE first number of *Borderland*, a Quarterly Review and Index, devoted to the study of the phenomena vulgarly called supernatural, appears simultaneously with this issue of the REVIEW OF REVIEWS. *Borderland*, as its name implies, deals with subjects which lie on the borderland between science and superstition. Emile Zola, who is one of the severest of the Realist-Positivist school, in his address to the Students' Association, deplored that he had made one mistake in too severely limiting the field of literature. He said that between the facts which were indubitably ascertained by science and those which were yet to be affirmed, there existed a borderland—a field of doubt and inquiry which it seems to me is as much within the province of literature as within that of science. Thither may we go forward as pioneers, accomplishing the work of precursors, interpreting, according to the bent of our talents, the action of those forces of which we as yet know little or nothing.

It is to the study and observation of that field that *Borderland* invites its readers, with what result time alone will show.

IS IT EXPEDIENT AND RIGHT?

The first number of the new quarterly opens with a mass of correspondence received from men and women of eminence in all departments of thought. Before publishing *Borderland* I solicited the opinion of those who, from their position in the world of science, of letters, and of affairs, might be supposed to have more or less definite convictions as to the expediency of prosecuting an inquiry along what many are still inclined to regard as forbidden paths.

Of the many who have written to express an opinion as to the lawfulness and expediency of the inquiry, the Bishop of Durham is the most eminent of those who affirm the unlawfulness of the investigation. Among the other ministers of religion who express more or less decided opinions on one side or the other are the Bishop of London, Bishop of Rochester, Bishop of Bath and Wells, Archdeacon Farrar, Rev. H. R. Haweis, Principal Reynolds, etc. As might have been expected, the new venture meets with a cordial "send-off" from the leading members of the S. P. R. Mr. Balfour, the President, Professor Oliver Lodge, Mr. Myers, and other leading investigators express more or less fully their opinions as to the new venture and the lines on which it should be conducted.

WHEN DOCTORS DISAGREE.

Professor Ray Lankester, on the other hand, takes, as a matter of course, the familiar attitude of the scientist who is quite sure there is nothing in it but fraud and imposture; his letter, which is printed in full, is interesting as the frank expression of the attitude of the materialist school. Dr. Alfred Wallace, on the other hand, Professor Janet, and others, express themselves in favour of the inquiry. Of men of affairs, a couple of ambassadors deprecate the investigation of a region which lies beyond the sphere of diplomacy; but Mr. Curzon, on the other hand, who may be regarded as a rising diplomat at large, expresses himself very clearly on the opposite side.

Lady Henry Somerset and Miss Willard both favour the attempt to penetrate the mysteries of *Borderland* by applying to them the ordinary scientific method of experimental research. This chapter, although very in-

complete, reflects with accuracy the prevailing chaos of opinion upon the subject in hand. Take it as a whole, those who say that they know nothing at all about the subject, advise me to have nothing to do with it; on the other hand, those who, in their personal experiences or by study and research, have familiarised themselves with the question, advocate the prosecution of the inquiry.

JEANNE D'ARC'S CLAIRVOYANTS.

Instead of beginning the stories of eminent psychics with an account of Swedenborg, I publish the story of Jeanne d'Arc, who is certainly the most eminent clairvoyant and clair-audiant of the last thousand years. The story of her Voices and of her adventures down to the triumphant raising of the siege of Orleans is told with chapter and verse in the only form in which the ordinary Englishman will receive a narrative of the supernatural without mocking. The department of Book Reviews occupies considerable space, the book that is dealt with at greatest length being Mr. Hudson's "The Law of Psychic Phenomena," in which the author claims to have discovered the principle by which you can eliminate the ghostly factor from all the phenomena of *Borderland*. His theory of the duality of the human mind is ingenious and undoubtedly supplies a key to many phenomena which have hitherto been regarded as insoluble.

THE STORY OF "JULIA."

What will probably attract the most attention in the first number is the account which I give for the first time of how I began to write automatically. I have received so many inquiries from far and near on this subject as to convince me of a very widespread interest on the subject. The story of Julia, from whatever point of view it is to be regarded, is interesting, and presents features which are certainly inexplicable by Mr. Hudson's "Law of Psychic Phenomena," or any other hypothesis that has yet been put forward, excepting of course that of communication from an intelligence not myself, which is capable of controlling my hand. The Review and Index of the periodical literature of the preceding six months is little more than an apology for what it should have been, but excuses may be made for a first number.

OTHER FEATURES.

Among the other articles in *Borderland* are Mr. Fitzgerald Molloy's paper upon Astrology, while other writers deal with the question of psychical nomenclature, and the best method of classifying the phenomena which are under consideration. Considerable interest is likely to be excited by the chapter on psychic healing, and an attempt to explain the theory by which it is sought to account for the miracles of Lourdes, and the cures wrought by the Christian scientists in the United States. Special prominence is given to the experiences of persons under anæsthetics, it being held that the phenomena of anæsthesia correspond very closely to those which accompany death, so far as the liberation of the consciousness of the patient from the body with which it is usually bound up. *Borderland* is published at 1s. 6d. Whether or not this new venture will enable us to push the frontier of *Borderland* a little further into the unexplored ocean of Truth, remains to be seen.

THE REVIEWS REVIEWED.

THE FORTNIGHTLY REVIEW.

I HAVE noticed elsewhere Mr. Smalley's interesting paper on "A Visit to Prince Bismarck."

THE EVOLUTION OF OUR RACE.

Mr. Frederic Harrison reviews Dr. Pearson's "National Life and Character." As might be expected, he differs from Dr. Pearson:—

Where we differ is this. Dr. Pearson assumes that *civilisation will remain as it is*—and accept the inevitable. I believe that Humanity will rise to the occasion, and will make successful efforts to triumph over the dangers which beset it.

Mr. Harrison accepts without demur Dr. Pearson's estimate as to the fate of white men outside the temperate zone. He says:—

I have long been satisfied, from the convergence of independent witnesses, that the white man never can form the permanent and efficient population of any but the temperate lands; that in many of the vast areas which he has overrun in his greediness he will have most miserably to die down. But this prospect, though sad, does not overwhelm me as much as it may dishearten the wilder partisans of Greater Britain. The wages of sin is death; and the wages of national buccaneering is disaster in the end. Why should we wish to see the white man settled in any but in the temperate zones, where he best thrives?

Mr. Harrison says many things that are worth repeating, and a few that are worth forgetting. Among the latter, his Liberal friends will give a high place to his assertion that Home Rule is the death of the Empire. If the British elector could be got to believe that, Home Rule would be as dead as Queen Anne.

THE SQUALID VILLAGE OF LONDON.

Mr. Grant Allen, having been scolded for speaking of London as "a squalid village," retorts by printing several pages of elaborate sarcasm in the form of an apology to London for suggesting that it was less beautiful than Venice, less artistic than Florence, and less majestic than Rome. He attributes what he calls the exceptional and extraordinary development of artistic taste in London to two causes—

First, the Great Fire; second, the abundance of suitable building material in the aptly-chosen form of brick and stucco; third, the enlightened and expansive spirit of the Corporation of the City of London, which has watched with fostering care the development of the suburbs, and so insured the general acceptance of a comprehensive system, whereby the map of the town as a whole, instead of being disfigured by broad open spaces or large and unpicturesque thoroughfares, has been closely modelled upon the picturesque pattern of the Cretan labyrinth, so as to present at last an agreeable variety of underlying ground-plan, counterbalanced and heightened by a charming uniformity of detail and a universal fidelity to the Ascalonian stucco style of architecture.

THE RECENT SOLAR ECLIPSE.

Professor Thorpe, who was one of the party of astronomers who went to Africa to photograph the sun from the West Coast, gives a rather pleasantly written narrative of his adventures. In the four minutes during which the eclipse lasted, Sergeant Kearney secured ten out of twelve corona pictures that he had been instructed to make. Mr. Fowler obtained thirty photographs, while Mr. Gray and Prof. Thorpe made twenty photometric measurements of the light from different parts of the corona. The best results, however, appear to have been obtained by Professor Schaeberle, at the Lick

Observatory, who obtained fifty photographs, one of which shows the image of the sun four inches in diameter, the corona covering a plate eighteen by twenty-two inches, THE MAUSOLEUM OF IBSEN.

Mr. William Archer has a pleasant revenge in his paper, which reminds us of the door of a gamekeeper's cottage, which is covered thick with the vermin nailed up as a warning to evil-doers. For Mr. Archer fills several pages with extracts from what I suppose may be called by courtesy "Dramatic Criticism," but which is little more than the atrabiliary outpouring of prejudice and ill-temper on the part of certain persons who are paid to notice things theatrical on the London press. The net result of all their vituperation, according to Mr. Archer, is that in the course of the last four years 100,000 copies of prose dramas by Ibsen have been bought by the English-speaking public. In the English publishing world such a sale is absolutely unprecedented. The receipts of theatres at which Ibsen plays have been produced amount to over £5,000, the net profit of the ten matinées of "Hedda Gabler" amounting to £28 per performance. From which it would seem that, if you want a thoughtful public to take any interest in any play, you cannot adopt a better expedient than by getting Mr. Clement Scott and the others to abuse it up hill and down dale.

WOMEN TRADE UNIONISTS.

Miss E. March Phillipps writes on this subject from knowledge acquired by personal experiences, for she went down to Lancashire, and lived for weeks with the operatives when the cotton strike was at its highest. The strongest impression she bore away was of the force and colour given to the lives of both men and women by their trade unions. Miss Phillipps gives many illustrations of the extent to which competition of unorganised women's labour is dragging down the rate of wages to starving point, and she deplores the apathy which leads so many female workers to remain outside the fold of trade unions. This apathy she attributes first, to the fear of employers; second, to the home employment; and third, to the character of the employed. Miss Phillipps says that more often than not women workers are timid, indifferent, frivolous, and excitable; and, for a new Sunday hat, or a walk with Tom or Dick, would sacrifice the best interests of all the women in the world without a pang. Miss Phillipps hopes most from the influence of male trade unionists on women. As for dressmakers, it is hopeless doing any good for them excepting by an efficient staff of female inspectors.

ONE HUNDRED YEARS OF AMERICAN PROGRESS.

The article by Dr. Brock contributed to the Review under this heading, is not an article, but an abstract of the statistical abstracts of a hundred years. Mr. Carnegie would revel in the figures, but the ordinary reader will find them about as readable as an arithmetic or a dictionary. Dr. Brock thinks that the statistics which he parades indicate a great advance on right lines to a higher, better, and purer civilization than has ever before existed in the world's history.

OTHER ARTICLES.

The other articles describe Augustine Brohan, the famous actress of the Comédie-Française, and Mr. C. B. Roynance-Kent's paper, from the extreme anti-Russian point of view, the late Russian intrigues in south-eastern Europe.

THE NINETEENTH CENTURY.

I NOTICE elsewhere the two articles upon Home Rule.

THE NEW SOUTH SEA BUBBLE.

The Hon. John Fortescue discusses under this head the financial crisis in Australia. Mr. Fortescue has long been a pessimist of the pessimists in this matter, and may be regarded as a kind of twin to Mr. Wilson of the *Investors' Review*. The following passages give Mr. Fortescue's conclusions:—

The pauper Government, having neither bullion nor gold, of course promises to redeem everything and "guarantees" everything. Never was there a more hopeless welter—result of ignorance, incompetence, and worse. It is the story of Argentina slightly altered—*moratorium*, *Cedulas* (*alias* Treasury notes), and all. Such is the pass at which the Australians have arrived. I have dealt mainly with Victoria and New South Wales; but Queensland (which has a paper currency scheme also) is no better, and South Australia alone seems to be in a more or less sound condition. Who is responsible for this collapse? First and foremost the various Colonial Governments. . . . Victoria and New South Wales must, in my belief, fall back on the British lender once more, or make default. Will the British lender support them? If he does, he will do well to stipulate that he shall have a voice in administering the estate which has so often been flaunted before him as his security. Otherwise he will simply throw good money after bad.

IS DISENDOWMENT ROBBING GOD?

Dr. Jessopp has a very interesting little article in which he expresses his distress on hearing his brother clerics declare that to disendow the Welsh Church is robbing God. He points out that from time to time, long before the Reformation, whenever the nation thought that any kind of good work could better be done by others than the clergy, they never hesitated to alienate Church lands, benefices, and tithes on their behalf. This was done for the Monasteries, the Templars, and for the Colleges at the Universities. Dr. Jessopp's principle is that of Samuel Taylor Coleridge, whose idea of a National Church is that which comprehends the learned of all denominations; in short, all the so-called liberal arts and sciences. Dr. Jessopp points out—

The leaders in thought and culture, in mathematical and physical science, in history, economics, linguistics, even in classical learning—the leaders in literature in its widest acceptance—are no longer to be found among the ordained clergy of the Church of England, but outside their ranks. One fact alone may serve as a most startling confirmation of these assertions. In 1843 there were ninety Fellows of the Royal Society who were in Holy Orders; in 1893 the names of no more than sixteen.

It would be worse than madness, Dr. Jessopp thinks, to shut our eyes to the significance of that fact.

THE PAN-BRITANNIC GATHERING.

Mr. Astley Cooper writes cheerily concerning the progress that has been made in carrying out his proposed "Pan-Britannic Gathering" with its scholarships, athletic competitions, etc. A strong representative committee has been formed in Great Britain and the Colonies in support of the Athletic Organisation; this scheme has found friends among many public men. Interest has already been quickened in many games by the mere proposal, which, if it was carried out on the scale and with the magnificence which he has in his mind's eye, Mr. Cooper thinks would be an agent and incentive to friendliness and manliness for many generations to come. In the course of his article Mr. Cooper discusses the possibility of finding a name that would be a substitute for the cumbersome English-

speaking man. He favours all Anglians, but the Irish, Welsh, and Scotch would alike object to either Anglian or Angle; so far the English-speaking race holds the field.

HOW TO CATALOGUE BOOKS.

Mr. J. Taylor Kay discusses the cataloguing of books from the point of view of one who has paid a great deal of attention to his subject. The Americans and Germans are ahead of us in this subject, and Mr. Kay, although well enough informed about what is being done in indexing in America, does not seem to be aware of the existence of the "Annual Index to the Periodicals of the World," which is published at this office. He mentions that there has been no difficulty in arranging all British and American Literature in "Ellibone's Critical Dictionary of English Literature" under 40 heads and 273 sub-heads. This book contains 83,000 authors, and more than 220,000 subjects. Mr. Kay points out:—

An advantage likely to accrue from the more persistent study of bibliography is the greater attention that would be given to our periodical literature, and the utilisation of much of it. Times have changed, and some of the best literature is now contributed to periodical publications.

As a practical suggestion, he says:—

The possibility of utilising the practical position of the Stationers' Company in the formation of a powerful body, under Government supervision, to take in hand the publication of a General Catalogue of English Literature, is worthy the highest consideration.

COOKERY AS A BUSINESS.

Mary Harrison renews her plea for the establishment of Cookery Schools. She maintains that no one ought to consider that they can even do plain cookery until they have had three years' definite and systematic instruction. Teachers should be thoroughly trained French and English cooks, and the increase in the wages of the trained cook would be saved in the avoidance of waste in the kitchen caused by bad cooking and spoiled food.

OTHER ARTICLES.

Esmé Stuart describes a strange affinity and resemblance between Charles Bandelaire and Edgar Allan Poe. The Hon. T. A. Brassey briefly applies the principles laid down in Captain Mahan's book upon "Sea Power in History" to Great Britain as a Sea Power. Mrs. King describes some of the eccentricities of "Mediæval Medicines." Mrs. Ward translates Professor Harnack's examination into the origin of the Apostles' creed. Professor Goldwin Smith writes a survey of the position in the United States.

PRIZE CALENDAR FOR MAY.

THE two best Calendars this month run each other very close. The Prize is won by—

1. W. RICHARDS, Ardbeg Villa, Oban, Scotland.

The next best eleven follow in order of merit:—

2. Miss M. A. Holloway, Lochbuie House, Isle of Mull, Scotland.
3. Miss Rachel F. Thompson, Castle Hill House, Settle, Yorkshire.
4. W. Culling Gaze, Fengate, Peterborough.
5. Miss Jessie Hay, 33, Abbey Street, Elgin, Scotland.
6. "Kate Halero," 28, Nassington Road, Hampstead Heath, N.
7. Miss E. Le Huquet, Greencliff, St. Martin, Jersey.
8. A. Brooking, Regent's Park, Heavitree, Exeter.
9. Miss Cecile Lambert, 27, Blenheim Crescent, W.
10. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.
11. Miss Sarah Lukes, Clifton House, Par, Cornwall.
12. Miss N. Edwards, Park Farm House, Eitham, Kent.

THE NEW REVIEW.

THE *New Review* is a very interesting number. I notice elsewhere the two studies in character of the Princess May, and M. Zola's "Life and Labour."

A PLEA FOR CARLYLE'S HOUSE.

Mr. Strachey's "Reminiscences of Carlyle, with some Unpublished Letters" do not add very much to our knowledge of the veteran. It concludes, however, with a practical suggestion which many people will be very glad to see carried out:—

In countries whose wealth is not that of Peru, the liberality of individuals, or of municipalities, or of the State, has permitted the purchase and maintenance, for the public credit and advantage, of the houses and relics of some of the heroes of the nation. Cologne, Dresden, Weimar, Marbach, Salzburg, have thus paid respect to the *manes* of Beethoven, Körner, Goethe, Schiller, Mozart. Is it hoping beyond hope to wish that, by a similar application of "the cash nexus," rich England and America might do like honour to the memory of Thomas Carlyle, so that the sanctuary in which he wrote, smoking his long clay, and patting at intervals Nero or Tib, may no longer be described in the daily press as the haunt of astral spirits and of starving cats and dogs?

THE POISON OF THE FUTURE.

Dr. Sprigge discusses the question whether or not the poisoners of the future will be able to poison by the communication of germs of disease. His conclusion is reassuring:—

We need not fear any general employment of bacteriology by the criminal. First, only a very small number of people would be able to commit murder by germ-inoculation. This means in itself that the crimes must remain few, unless some enterprising pathologist of modern days should emulate Ruggieri and prepare to sell deadly cultivations wholesale. Second, only a very small number of germs could be so utilised. The poisoner of the future will not be a very dreadful person, at any rate will not be a more dreadful person than the poisoner of the present; unless we credit in the future all the scientific acumen to the villain, and none to those engaged upon the side of justice.

OUR PUBLIC SCHOOLS AS THE CITIES OF THE PLAIN.

An anonymous writer, in an article on "Our Public Schools: their Methods and Morals," makes the following sensible observations concerning a great and crying evil:—

The whole matter lies in a nutshell. Boys at a public school arrive at an age when new and unthought of physical powers overcome the moral judgment of which their age is capable. Transgressions on which a few years later they will look with horror seem to them at least venial. There is little or no sense of moral wrong—there is no restraining influence but a fear of the consequences. Occasionally some glaring iniquities reach the ears of authority, and a wholesale expulsion takes place, which fails altogether to impress those remaining with any sense of the moral enormity of the offence, while it blasts young lives with a sometimes ineffaceable stigma. One party is almost always innocent, and yet he has to undergo the penalty meted out to the tempter. To such a pitch has this evil reached that some of our public schools almost provoke the punishment of the Cities of the Plain.

Surely the matter is not beyond wise treatment. A year or two later those who have sinned the most, in the clearer light of a wider experience, look back on their deeds with horror and shame. Cannot our masters put these things before those whose lives are committed to them as a sacred charge in a manly and sensible way—point out to them that the young men of Sodom are in a more perilous plight than those who yield to the blandishments of Delilah? But they will not, until the occasion arises: until the mischief is done their lips are sealed. The subject is too horrible and must be avoided. I am convinced that it only requires the opinion of the world

to be properly impressed on boys who are just coming to the most critical time of their lives to ensure the horror-struck avoidance of nameless vice.

CANADIAN WOMEN.

Lady Jephson, writing upon "Canadian Society, Past and Present," pays a high tribute to the moral character of Canadian society. She says:—

Certainly no more modest and pure-minded women are to be found anywhere than in Canada, and this in spite of more latitude given as regards the intercourse of men and women. With none of the prudery which exists in France and Italy, there is an absolute propriety, and divorces and undignified conduct in married life are almost unknown. Before marriage the Canadian girl is allowed her fling, and she dances, skates, flirts, and enjoys life to the full.

Between the Church of England and Dissenters there is much amity and marked friendliness all over Canada. Sabbath observance among English-Canadians is carried to such excess that a game of tennis or "halma" on Sunday is enough, if discovered, to socially ostracise its perpetrators. A servile respect and ridiculous obedience to the dictates of Mrs. Grundy is everywhere most marked. With much priggishness, however, there is undoubtedly a high code of morals outside of political doings. Perhaps no country can show a more Puritan spirit in family life.

CRIMINALS AND THEIR DETECTION.

Mr. E. R. Spearman describes at length the method adopted in France of making anthropological examination of criminals. It seems that Mr. Spearman took Sir Charles Russell and Sir Richard Webster to see the Bertillon system in practice at the dépôt where all the prisoners of Paris are pooled daily.

The National Review.

THE *National Review*, if it were not for Mrs. W. K. Clifford's "A Grey Romance," would hardly be up to the mark. Mr. Hodgson's modern conversation is very like Mr. Hodgson, and when that is said, all is said. "One who knows" takes up the cudgels for the Post Office, and attacks Mr. Henniker Heaton in an article which Mr. Heaton will have, no doubt, a great deal of pleasure in answering. It is a great thing to get your adversary to condescend to reply in print. Mr. Bompas gives us what may be regarded as the popular Q.C.'s case for believing in Christianity. The Hon. Lionel A. Tollemache gives us some reminiscences of Sir R. Owen. Mr. Mallock, in his paper on the "Future Income of Labour," gives us another instalment of his book; the gist of his observations is that the proper way to benefit the labourer is not to seek to reorganise and revolutionise society, but to start from the basis of national stability.

GLACIERS AND VALLEYS.—In the June number of the *Geographical Magazine* Professor Bonney's paper, maintaining that glaciers do not excavate, is published, with a report of the discussion it provoked. Professor Bonney maintains that "the excavatory power of glaciers has been much exaggerated; the European glaciers generally have not been very potent agents of erosion or even of abrasion, probably because the glacial epoch was comparatively of short duration."

THE *Humanitarian* publishes its July number of the new cover, and gives the first place to Mrs. Woodhull Martin's paper on the "Alchemy of Maternity." There is a useful paper on "Anthropometrical Descriptions," by Monsieur A. Bertillon, describing the ways and means by which a man can be measured from the top of his head to the sole of his feet in such a way as to render it impossible for him to evade identification."

THE NORTH AMERICAN REVIEW.

THE most important article in the *North American Review*, Mr. Carnegie's "A Look Ahead," is noticed elsewhere, as also is Professor Biles's paper on "Thirty Knots an Hour to Europe."

"THE LESSON OF THE NAVAL REVIEW."

Mr. Hilary A. Herbert, as secretary for the navy, writes upon the lesson of the Naval Review. The article is somewhat slight, but it points in the right direction; he is all for peace and national arbitration, but he believes in utilising force in the service of international peace, as it has already been utilised in the suppression of civil broils.

The real Quaker who will submit to insult rather than resent it by violence is not a successful peacemaker among men. Neither can a nation which adopts a Quaker policy, however great it may be in natural resources, expect in this age of the world that its international disputes shall be arbitrated by international tribunals, or hope to keep the lead in the great work of bringing about the "brotherhood of nations." If America would keep her own peace with all the nations of the earth, and maintain her place in the vanguard of civilisation, she must be at all times prepared for war. This is the lesson of history emphasised by the *Rendezvous* and the *Review*.

MR. MALLOCK'S THEORY OF WEALTH.

In a paper entitled "Who are our Chief Wealth Producers?" Mr. Mallock repeats the conclusion at which he has arrived in English reviews as to the origin of wealth. The ordinary doctrine is that wealth is produced by the many and enjoyed by the few: Mr. Mallock's theory is that it is produced by the few and enjoyed by the many. He sums up his thesis as follows:—

It can in the long run be to the interest of nobody to disguise the truth; and an accurate study of economics will teach us this, that the few, however inferior morally, produce the larger part of the wealth of the modern world; that wealth is not, as is commonly said, the result of social labour, but the result of social labour multiplied by ability; and that whatever claims the public may have on the wealth of the minority, that claim cannot be sustained on the ground that the public has produced this wealth; for the minority as a body have not only produced the whole of it, but a vast amount besides, which the public has already appropriated.

WOMEN AS EXECUTORS.

The Hon. R. S. Ramson, Surrogate of New York county, contributes a paper entitled "How to Check Testamentary Litigation," which need not concern us in England, but one observation which he makes is of general interest—it is that in which he maintains that women are incompetent to administer wealth. He says:—

Many women are named as executrices of wills, and it is my experience that they know little or nothing of business, rely largely upon their emotions and intuitions, and fall an easy prey to the ever ready, and always convenient, confidence man and sharper. My own judgment is that women should never be compelled or permitted to undergo the labour and responsibilities of these positions. I am of opinion that good safe trust companies are the best executors, etc., and by far the best guardians of the estates of infants.

"VANISHING DICKENSLAND."

Mr. Charles Dickens has an interesting and well-informed paper concerning the disappearance of the London that is immortalised in his father's writings. He says there is really little or nothing left of Dickensland in the London of to-day, but guides constantly take Americans round to various places and point them out as if they were the same places which Charles Dickens

described. One of these frauds is the "Old Curiosity Shop" in Portsmouth Street. Mr. Dickens says:—

Just round the corner, as it were, where Portsmouth Street joins Lincoln's Inn Fields, is the choicest and most generally believed in of all the bogus Dickens' sights. This is a mean little building, now used as a waste-paper store, which describes itself as the veritable Old Curiosity Shop "immortalised by Charles Dickens," and which has about as much to do with the genuine building—if Nell's home had any actual brick and mortar original—as the Capitol in Washington itself.

As it is with the "Old Curiosity Shop," so it is with almost everything else that seems to be associated, even in name, with the localities mentioned in "Pickwick":—

It is not only individual houses belonging to Dickensland which have been lost to us in process of time. Whole neighbourhoods have changed their nature; new and handsome quarters of the town have arisen, not only since the days of Mr. Pickwick, but since the death, only twenty-two years ago, of his creator himself.

WANTED—A REFORMED PUBLIC-HOUSE.

Dr. Rainsford, in a paper on "The Reform of the Drink Traffic," maintains that the Prohibitionists are on the wrong tack, and the proper thing to do is to start reformed public-houses on sound principles. He says:—

For many a day to come we must depend chiefly on personal effort. Earnest men who will not readily be discouraged and who command universal respect, men of moderation and of means, are wanted. They can establish decent restaurants, where music is provided; decent places where people will be ashamed to get drunk; where all things make for moderation, not excess; where the laws could be obeyed absolutely, no blackmail paid to any one, and all business done on a cash basis.

These, when wisely placed, would pay a reasonable interest on money invested in them—and they would be a perpetual object-lesson of great value. They would draw the attention of the capitalist as a safe investment; and soon, when his prejudices were overcome, the sober and temperate portion of the working population would discover in them the very thing it needs so sorely—an innocent place of rest and recuperation, where families as well as individuals may escape from the narrowness of home.

The other articles deal with police protection at the World's Fair, and the financial outlook.

In the *Jewish Quarterly Review*, besides Mr. Oswald John Simon's article on Judaism, noticed elsewhere, there are two very interesting and important essays, one by Mr. Montefiore upon "Hebrew and Greek Ideals of Providence and Divine Retribution"; the other by the Rev. Michael Adler upon "The Emperor Julian and the Jews." In the course of the latter article Mr. Adler discusses at length the nature of the evidence as to the miraculous attempt to rebuild the Temple at Jerusalem. Mrs. Henry Lucas gives us a metrical translation of some of Jehudah Halevi's poems.

In the *Newbery House Magazine* there is a remarkable portrait of Canon Liddon, the value of which is, however, minimised, as no mention is made as to the year in which it was taken. The portrait seems to have been taken when he was not yet thirty years of age. A story is commenced entitled "A Real Repentance," by Austin Clare, and the scene is laid in Oberammergau. Mrs. Hernaman has an interesting paper on "Early Primary Education," and Mrs. Buckeley-Owen writes of "The Non-Jurors." Lady Laura Ridding has a valuable paper dealing with "Women and Children: their Needs and Helpers."

THE FORUM.

THE *Forum* for June is a good number. I notice elsewhere Mr. Frederic Harrison's article on the decadence of art, Mr. Finck's account of the Paderewski mania in America, and Dr. Billing's paper on the diminishing birth-rate of the United States. The rest of the papers deal almost exclusively with political and financial topics.

WHAT AFFECTS THE SALE OF BOOKS.

Mr. Boyesen discusses the value of American literary criticism, and quotes from a conversation he had with Mr. E. P. Roe, an American novelist whose books had the largest circulation of any writer of fiction in the United States, but he was almost entirely ignored by the newspaper critics. Being asked how this was, Mr. Roe replied:—

"The fact is I can't discover that the newspapers affect the sale of a book one way or another. The people whom I reach read very few newspapers; and I think they are more influenced by their neighbours' opinions than by anything they read." "What then, in your judgment, determines the success of a book?" I asked. "Well, I should say its nearness to the life and thought of average men and women," Mr. Roe replied. "How do you mean?" "I mean that what the critics call art removes the book from the intelligence of ordinary people. I have been blamed because there is not art enough in my novels. Well, to be frank, there is as much art in them as there is in me. No more and no less. I never try to write down to any one's intelligence; but I write as well as I am able to write, and then let the art take care of itself."

AMERICAN COLLEGES AND AMERICAN LIFE.

President Thwing has an interesting paper as to the extent to which Americans who have had a collegiate education have taken a leading part in American life. Taking as the basis Appleton's "Cyclopædia of Biography," he says:—

Of the 15,142 men named in the book, 5,326 are college men, or slightly more than one-third. Of them also 941 are what may be called academy but not college men. It is to me exceedingly significant that so large a proportion are college-bred.

One man in forty who has been through an American college achieves sufficient distinction to be mentioned in "Appleton;" of those who do not go to college, only one man in 10,000 succeeds in achieving such a position. Dr. Thwing, speaking of the American university, says:—

It therefore does not seem too much to say that the American college has profoundly influenced American life. It has not been the mother of great movements, like Oxford, but it has been the mother of great men, like Cambridge. It has not made great soldiers or sailors, great artists or inventors; but it has contributed vastly toward the worth of the more considerable elements of thought and character.

THE OBJECTION TO AMERICAN ANNEXATIONS.

The Hon. T. M. Cooley sets forth in a paper entitled "Grave Obstacles to Hawaiian Annexation," the traditional American objection to possessions over sea. It is an objection which, before many years are over, will be overruled, but at present it still exerts a certain influence upon the mind of American citizens. Mr. Cooley states their view fairly well in the following sentence:—

The Constitution was made for the government of the United States of America, and not of countries in different parts of the world. It was not made and shaped for the establishment of any colonial system. It was expected by its founders that there would be extension of the United States; that territory would be held by them which would require government under the authority of Congress, but only while in that condition of immaturity which would naturally precede a state of fitness for admission with complete powers into the family of

states then composing the Union; and that family of states was expected always to be one American country, held by one people, with institutions harmonious throughout, and as free as possible from all alliances with nations abroad except such as should be in the nature of friendly intercourse between independent countries.

CHINA'S VIEW OF CHINESE EXCLUSION.

The Rev. Gilbert Reid sets forth clearly the view which the Chinese in China take of the exclusion of their countrymen from the United States. The story of Chinese exclusion is not a chapter of which Americans have any reason to feel proud. Mr. Reid says:—

If it is right for the United States to pass laws which will abrogate our treaty-stipulations, then the Emperor of China can issue decrees or edicts which will also abrogate her treaty-stipulations with America and all other Western powers. Would it not be better to seek for harmony between the laws of our country and her contracts with another country? Why is it necessary to bring about a collision between these two forms of legal obligation?

OTHER ARTICLES.

Dr. J. M. Rice sums up the result of his recent examination of the public school system of the United States. The general educational spirit of the country is progressive, but there are many schools which are a disgrace to an enlightened nation, and among the thirty-six cities which he visited, he only found four whose schools were conducted upon the principle of unification. The other articles deal with the pension scandal, office-seeking, and the causes of the financial excitement. Mr. Gibson is inclined to take a hopeful view of the silver question. Two years ago there were thirty mines at Aspen in Colorado making a profit; to-day only three pay dividends.

The Secret of Youth in Age.

THERE is a very remarkable old gentleman living at Florence, of the name of Sebastiano Fenzi, who is the president of the Italian Gymnastic Society. He maintains he has discovered the secret of preserving physical vitality far beyond the limits held to be possible by ordinary mortals. He has embodied his secret in a small poem, which is published at 6d. As Signor Fenzi challenges the world to produce any old gentleman of seventy-five who will compete with him on equal terms—and he is quite plaintive in his appeal to me to make this great discovery known to my readers—I am willing to receive any orders for his tiny brochure—sevenpence post-free—but I can say nothing about the value of his system. One of the leading features seems to be that of going to bed for an hour after you have had your cold tub in the morning!

Vicomte de Vogue.

In an article in *Blackwood's* there is a very interesting and curious account of this writer, whose contributions are amongst the most brilliant in the French press:—

No one is better suited to his incontestably historical work than M. de Vogüé, for he is of every time, of every school, and of essentially mixed race. Scottish by his Scottish mother, of typically Scottish origin, his father is a Provençal gentleman of indisputable character. He himself stands near to the head of the new "psychic" group; prolonging the traditions of Chateaubriand through Lamartine; philosopher, poet, and political seer; historian through Lavisse; matured by the tragic events of the war of 1870, in which he played a sadly active part, teaching him the painful tolerance of adversity, wisely applied,—there is no sense, literary, political, social, or human, in which M. de Vogüé does not prove his right to pronounce judgment on the deeds and motives of modern Frenchmen, and to be listened to, for the reason that he is exceptionally qualified by nature, circumstance, and individual character, to speak the truth.

THE ECONOMIC JOURNAL.

THE June number of the *Economic Journal* is rather above the average. It contains several articles of considerable interest. One by Mr. Schloss deals with the subject of arbitration in trade disputes. He says:—

The fact that the Government has brought in a Bill intended to promote the settlement of industrial disputes by conciliation and arbitration may lend interest to a brief review of the legislative measures which have been adopted with a similar object in this and other countries.

And therefore he gives us a very valuable survey of what might be called Industrial Arbitration Legislation in various countries and colonies of the world.

Mr. C. Edwards describes the formation of Labour Federations, and points out that in this movement the workmen followed the employers.

Nearly every Labour Federation has followed the formation of an Employers' Federation as a means of defence, and not preceded it as a means of aggression. This is true not only of the earlier federations, but also of nearly all the existing federations.

Mr. C. F. Bastable writes upon the taxation of ground rents, and comes to the same conclusion at which Lord Hobhouse arrived long ago, namely, that there is not much fleece to be got off that particular sheep. He says:—

No matter what special measures may be thought advisable, it should never be forgotten that no very large relief can be expected from them. The supposed store of wealth due to no one's exertion and ready for public use is to a great extent an illusion. Most of it is being gradually distributed amongst the members of the community; a great deal of it is due to foresight and energy on the part of its present holders. To urge that occupiers will not permit municipal improvements unless they are satisfied that other people are to bear the expense is not a plea that can be accepted. Adjustments that meet popular feeling without violating the rule of fair distribution should be adopted, but there is no valid ground for a sweeping alteration of the real incidence of local taxation.

The article on the Danish Poor Law is noticed elsewhere. The shorter notices are very carefully done; amongst them you will find Mr. Edwards's account of the Hull Strike—"The History of the Seven Weeks' War"—written from the point of view of one who believes that everything turned from first to last upon the question whether or not non-Unionists ought to have preference of employment over Unionists.

THE ARENA.

THE *Arena* for June contains one good article by Mr. Arthur McDonald on "Insanity and Genius," which maintains that they both are the result of excessive nervous or psychic power, and are both abnormal developments that partake of the nature of disease; and another by Mr. Flower on the Civic Church, which I notice elsewhere.

HOW TO CURE CHOLERA.

Dr. R. B. Leach has a remarkable article entitled "Arsenic versus Cholera." He maintains that 90 per cent. of all cholera patients can be cured by dosing them with arsenic. The originator of the theory is very anxious to be sent at once to a hotbed of infection, in order to satisfactorily demonstrate that where any person is under the physiological effect of arsenic he cannot take cholera. Arsenical poisoning is a disease which occupies the same place and space as cholera. If you occupy the body with arsenic, there is not room for cholera; all that is necessary is a small appreciation to secure the trial of the method on an adequate scale.

FREEDOM IN DRESS FOR WOMEN.

Mrs. Frances E. Russell pleads that the American women should take the opportunity afforded by the "World's Fair" to wear the reformed dress when going over the show. To walk through the aisles of the Exhibition would require seven days, walking twenty miles a day. The reformed dress varies from the almost invisibly divided skirt to the gymnasium suit. Unfortunately the question is, when can you get a sufficient number of women to begin wearing the new dress? One woman, who has been trying to wear a dress six inches from the ground, has almost broken down under the trying ordeal. Women are now, however, planning to wear a reformed dress at summer resorts and colleges, when the chivalry and patriotism of the men will be put to the test. Mr. Flower, by way of helping on the good work, gives a series of illustrations of his wife and friends in various reformed dresses, some of which can hardly be commended for beauty, although the worst of them are better than the hideous samples of prevailing fashions in Paris. He says that Rational Dress Clubs are about to be formed in various American cities, and the time has come for true American women to assert their independence.

Eight brief papers are published as a symposium advocating the adoption of the maize as the American national flower. The other articles deal with "Free Coinage of Silver," and "Liberal Churches and Scepticism."

ASIATIC QUARTERLY REVIEW.

THIS review is much above the average this month. The editor, Dr. Leitner, discusses the question of Indian and London Civil Services at much length. But the most important articles are those in which Lord Chelmsford and Sir Lepel Griffin discuss the advance of India against the possible Russian attack, extracts from which appear elsewhere.

CAN ANGLO-INDIANS LIVE IN INDIA?

Another article that is of some considerable interest discusses the possibility of colonising the hill countries of India with retired Anglo-Indians.

The writer sums up by saying that Simla, if he does not mind the rigours of the winter, or Ootacamund for all the year round enjoyment, would give the retired Anglo-Indian more for his money than Bayswater or Bath; but if he have a little energy left for a new life in a new country, and especially if he have a little capital, and does not mind risking it, let him go to Australasia.

Major-General Tyrrell discusses the proposed changes in the Indian army. Mr. J. C. Hopkins, writing from Toronto upon the position of Canada, thinks that the majority of the people are united in favour of a Canadian as against an American policy. There is a review of M. Paul Gault's great work upon Russian Turkistan.

WHERE IS MOUNT SINAI?

Professor Sayce publishes a paper discussing "Where is Mount Sinai?" He thinks we cannot locate the mountain peak of Sinai. Of one thing we may be certain, and that is, it was not the mountain now called by that name. Mount Sinai, indeed, he says, was not in the peninsula which is now called Sinaitic, it was nearer Mount Scir and Kadsh-Barnea; and if you want to find Sinai, you would be more likely to find it in Midian and Edom than in the Sinaitic peninsula.

The longest article in the *Review* is the first part of Com-mandant Aymonier's history of Tchampa, which is now known as Annam or Cochin China. There are other good articles on British East Africa and the Siamese question.

THE ILLUSTRATED MAGAZINES.

McClure's Magazine.

McClure's Magazine is a new sixpenny of the same general style as the *Strand* and *Idler*, but it is better than either of them in some respects. It differs from the *Idler* in being more serious, and from the *Strand* in being more up-to-date. It embodies the features of both and has others of its own. It is much more up-to-date than any of its competitors, and it ought to achieve a very considerable success. It is copiously illustrated, well printed, and there is any amount of good reading matter in it. The frontispiece is a portrait of Professor Drummond, who contributes one of his scientific articles, "Where Man got his Ears." I notice elsewhere the first of their "Real Conversations," which is a report of a

The Century.

The Century has as its frontispiece an engraving of the Gainsborough portrait of Mrs. Siddons. The first article is devoted to a description of colour at the World's Fair, and is illustrated by a view of the domes of the great palaces in the White City. Mr. and Mrs. Pennell describe "The Most Picturesque Place in the World," which they abstain from naming. "Would that mine enemy had written a book," is a prayer which is often answered in this world, and the idiotic article which Mr. Bodkine wrote in defence of Russia gives Mr. Joseph Jacobs and Mr. George Kennan an opportunity of replying of which they take full advantage. The "Autobiography of

From "Hartmann the Anarchist."

[English Illustrated Magazine.

THE DESTRUCTION OF LONDON.

dialogue between Mr. Howells and Mr. Boyesen; also Mr. Raymond Blathwayt's paper on "Wild Animals," the interviews with Mr. Edison and Graham Bell on the "Edge of the Future," M. de Blowitz's "Europe at the Present Moment," and Mr. Sherard's "Count de Lesseps To-day." In addition to those articles there is an excellent paper by Mr. Massingham entitled "A Day with Gladstone," a short story by Mr. Gilbert Parker, and another by Mrs. Robert Louis Stevenson. The only weak thing about the publication is the arrangement of the articles; the best articles are stowed away at the tail end of the magazine, while the dialogue with Mr. Howells and the somewhat meagre story by Mr. Parker are thrust into the front. The magazine, however, is edited with brains, and the editor announces that they have made arrangements for publishing Professor Garner's reports as to the progress which he had made in mastering the language of monkeys.

Salvini" is continued. This month's instalment contains a very interesting account of an hour's conversation the author had with Victor Emmanuel when the King presented him with the Cross of the Crown of Italy. Mr. Gosse writes briefly but sympathetically about Mrs. Siddons. The most carefully written article in the number is Mrs. Oliphant's paper on Dean Swift; it is not only written in Mrs. Oliphant's well-known style, but it is copiously illustrated with portraits of the Dean and his contemporaries. A very remarkable paper is that entitled "Famous Indians," which is illustrated with portraits which give us a more favourable impression of the appearance of the Indians than any that we have hitherto seen. These men instead of being Redskins might have been philosophers and sages of Ancient Greece. There is also a paper on "Mental Medicine" by a writer who calls it psychopathy.

The Pall Mall Magazine.

THE *Pall Mall Magazine* is improving, and the summer number is a very portly shillingworth. The contents are mostly fiction. Mr. W. W. Astor writes upon "Queen Marie Louise of Prussia," and "A Son of the Marshes" gossips pleasantly about "Old Hedgerows" and their occupants. Mrs. Parr illustrates her paper on "The Follies of Fashion" with specimens of ladies' head-dress which fill the modern mind with marvel; first of all that any creature with anything that could be regarded as a receptacle for brains could ever have consented to wear such head-dresses, and secondly, how that when they had come to that resolution it was possible for the human frame to support so much top-hammer. Karl Blind quotes from Goethe and Heine in order to prove that Mr. Gladstone was wrong in declaring that foreign opinion was universally hostile to English rule in Ireland. The article on the "Armies of France" is not up to the level of a similar article that appeared recently in an American magazine. "The Last of the Flying Dutchman," by Mr. W. L. Aldon, is an interesting story.

English Illustrated Magazine.

THE *English Illustrated* continues to maintain its improved position. "Hartmann the Anarchist" describes the invention by which he intends to destroy London. It is an ingenious combination of a balloon and a sailing machine, and the illustrations are very effective. The series of "Historic Homes of England" is begun with Bagshot Park; next month the subject will be Belvoir Castle, by the Duchess of Rutland. Mr. Quilter's paper on "Art" is noticed elsewhere. "The Romance of Modern London" is devoted to pictures of the early morning in London.

The Idler.

THE best paper in the *Idler*—"Alphonse Daudet at Home"—is noticed elsewhere, and also Mr. Zangwill's account of his first book. "The Memoirs of a Female Nihilist" contains a very interesting and vivid account of the prisoners in Russian gaols going into revolt; it is full of the actuality of truth. Mr. Robert Buchanan has an illustrated poem entitled "The Dismal Throng," written after reading the last study in literary distemper. Mr. Buchanan thus explains in prose what he endeavours to sing in verse:—

These verses refer to a literary phenomenon that will in time become historical, that phenomenon being the sudden growth, in all parts of Europe, of a fungus-literature bred of foulness and decay; and contemporaneously, yet the intrusion into all parts of human life of a Calvinistic yet materialistic morality. This literature of a sunless decadence has spread widely, by virtue of its own uncleanness, and its leading

characteristics are gloom, ugliness, prurience, preachiness, and weedy flabbiness of style.

The Cosmopolitan.

THE illustrations in the *Cosmopolitan* maintain their high standard of excellence. The contents of the June number are very varied. M. Flammarion's story of "The Last Days of the World" is noticed elsewhere, and also Mr. Baxter's account of "The First Woman of Spain," Signora Bazan. "The Deserted Homes of New England" is a remarkable article, with an interesting account of the social life in the abandoned farms in the hill region of Massachusetts. The account of "Sorosis," the mother of women's clubs in the United States, is illustrated by portraits of many of the leading women. It is claimed that Sorosis is the representative woman's club of the world. It might be well to see if anything could be done to establish an English Sorosis. An illustrated article, "The City of Brooklyn," contains, among other pictures, a portrait of Mrs. Henry Ward Beecher in her parlour.

The old story of the fight, "The Merrimac and the Cumberland," is told by Captain Selfridge, who was one of the few officers on board the *Cumberland* who survived.

The Californian Illustrated Monthly.

THE *Californian Illustrated Monthly* gives us pictures of the Grand Cañon of the Colorado; another paper is devoted to China by Dr. Masters. Of more general interest is the account given by a bicyclist of a rapid run through the Great Lick Observatory. Among the other papers are "Picturesque Utah," and an account of the "Icebergs of the South

Pole." A paper on the "Life Savers of the Pacific Coast" is chiefly notable for the clearness of its illustrations, but it will be read with interest by members of our fire brigade and life-boat crews.

Belford's Monthly.

Belford's Monthly is developing a much higher style of illustration than it has had for some time. It publishes as frontispiece this month Luke Fildes's "Venetian Life." The paper on "The Evolution of the Library" is also very copiously illustrated. The article on "The International Base Ball Tournament" describes the arrangements that are being made to have the base ball championship decided at Chicago. The stands will have sitting capacity for 13,000 people, and 8,000 feet of lumber has been used in its construction. Hester Higbee has rather a remarkable article entitled "The Apotheosis of 'Madame,'" the point of which is that women are just strutting a little bit too much around the World's Fair and America generally, and that the inflated balloon of their self-esteem might be pin-pricked with advantage.

A SUFFOLK MOATED HOME.

[From Good Words.]

THE NOUVELLE REVUE.

BOTH the June numbers of the *Nouvelle Revue* contain much interesting matter. We notice elsewhere M. Delacroix's concluding article on "The Witchcraft Trials of the Seventeenth Century." Apart from it, the most notable contribution to the *Nouvelle Revue* of June 1, is by M. Guillot, a member of the French Institute, on

"THE WAIF AND THE REFORMATORY."

When Napoleon I. drew up his famous Code of Laws he fixed the legal age at sixteen of personal responsibility for criminal acts committed by the individual; yet in Paris alone, during the course of last year, 888 children not yet having attained that age were arrested in the streets. "Vagabondage," according to its French sense, is, we are told by M. Guillot, "habitual, and constant desertion of the paternal homestead, of the school, or of the workshop is generally found to be the first or preparatory stage to the child's becoming a regular criminal." The writer of the article, who has evidently a great deal of sympathy with young folks, points out that most strong and well-grown children delight in the unknown—witness St. Theresa's childish escapade in search of the Moors; but he remarks significantly that the runaways of to-day rarely end by becoming great saints or founders of religious orders: the contrary is more frequently the case. M. Guillot, who cites many authorities to bear out his point of view, does not approve of the reformatory system as understood to-day. He is a great believer in home life, and, if circumstances make this impossible, he would have the youthful delinquent placed in a kind of home-reformatory, which should be styled a preservation house rather than a prison; for in a reformatory it is impossible to prevent the comparatively innocent little waif of eight or ten from becoming the habitual companion and friend of the accomplished criminal who is yet within two months of his sixteenth birthday.

"A DISCIPLE OF M. ZOLA."

M. J. Moog, under this title, gives an exhaustive account of J. H. Rosny, the author of "Nell Horn," and one of the most brilliant writers of the new French school of fiction. But although a disciple of the great realist, M. Rosny was one of those who signed a protest against his master's "La Terre," and his latest work has become more ideal than realistic, for in it he attempts an ambitious reconstruction of prehistoric times, in which his hero, Vamareh, fights Homeric battles with huge mammoths, the denizens of forests, now known as extinct monsters. M. Moog concludes his interesting literary appreciation of Rosny's work by pointing out that that author has a great future before him if he does not fall under the temptation of being willfully obscure and tortuous in expression and language.

"THE ONLY MODERN POET."

In the same number M. Jeannine describes at length another writer and his work: Gerhart Hauptmann, the author of "The Weavers." Hauptmann, according to M. Jeannine, is Germany's great coming dramatist. Born just thirty years ago in Silesia, his childhood was spent in a manufacturing centre, and close to a great world of mines and miners. He began life by wishing to be an artist, and worked hard at sculpture for some years, but finally abandoned the studio for the study. His first play, "Before the Dawn," was acted only three years ago in Berlin, at the German Independent Theatre; this drama, which was strongly socialistic and realistic in tone, was much discussed, and shortly after the best Berlin theatre accepted from him a play entitled "The

Isolated"; but it is as the author of "The Weavers" that his name finally became widely known all over Europe, for the German Government forbade its production on the boards of a State theatre, as its performance might have led to public disturbances. As was but natural, this action on the part of the authorities made Hauptmann at once an apostle and martyr in the eyes of the Socialist party. Everything that he now chooses to write will be acted at once, always supposing that the censor does not place an interdiction upon it. He is now working on an historical drama from which great things are expected. "Hauptmann's great merit," says the writer in the *Nouvelle Revue*, "is one rare in Germany, namely, that of having the power to create living personalities who speak in a natural manner according to their character and their conditions . . . We shall be curious to see if in France people will appreciate as he deserves the writer whom the Germans do not hesitate to proclaim their only modern poet."

SOME OTHER ARTICLES.

M. de Béhagle contributes a somewhat interesting account of his travels in Senegal and Equatorial Africa. His party, which was engaged on a semi-political mission, was away seventeen months, and claims to have assured the supremacy of France on at least a portion of the interior of Africa, and confirmed the treaties of Mison and de Brazza. M. de Béhagle also declares that he has proved beyond a doubt that the great rivers of Equatorial Africa are navigable the whole year round.

M. Durand Fardel has tried to give a vivid picture of Dante as he was, rather than as the ideal author of the "Divine Comedy," but he does not succeed in presenting a very pleasant picture of his hero, who, he says, if we are to believe Boccaccio, possessed "a long face, an aquiline nose, eyes rather large than small, strong jaws, with underlip always thrust out, a brown complexion, while his beard and hair were black and woolly." "Dante," continues his latter-day apologist, "was, according to his own confession, of an amorous complexion; this destroys the picture of the sombre personage from whom, as he walked down the street, the women are said to have edged away, saying one to another, 'Here is he who returneth from the Inferno.'"

THE REVUE DES DEUX MONDES.

WITH the exception of the interesting articles on "Prosper Mérimée," "The German Empire," and "The English in Morocco," noticed elsewhere, the two June numbers of the *Revue des Deux Mondes* have but few articles worthy of special mention.

THE HISTORY OF THE CONDÉS.

The place of honour is given to an unpublished chapter of the Duc d'Aumale's "History of the Condés," entitled "The Dunes," which may be said in this case to signify the Netherlands. In a few pages the royal historian gives an interesting account of Turenne and Vauban, and quotes "A true and just relation of Major-General Sir Thomas Morgan's progress in France and Flanders, with the 6,000 English in the years 1657 and 1658, at the taking of Dunkirk and other important places, as it was delivered by the General himself (London, 1659)," although he declares it to be singularly untrustworthy. There is little doubt that when completed "The History of the Condés" will form one of the most valuable additions to the military history of the world ever written, for the Duc d'Aumale has the advantage of having been a soldier before he became an author, and in undertaking to write the lives of those

who were his predecessors at Chantilly, he not only pays a debt of gratitude to the great Condés, but will have rendered a real service to French literature.

A DUTCH STATESMAN.

In the same number M. E. Michel draws a curious picture of Constantin Huygens, a Dutch statesman of the seventeenth century, who seems to have been a man of whom Holland may well be proud, for besides being an active patron of both letters and art, he played a certain part in the diplomatic history of his country. He was twenty-four when his father, one of the best known citizens of the Hague, made interest with the English ambassador, Dudley Carleton, in order that his son might visit England under the happiest conditions. Among the other places he visited in Great Britain were the Universities of Oxford and Cambridge, and after having thoroughly learnt English he returned to Holland, visiting later Italy, Germany, and once again England, where he went as secretary to the Dutch ambassador, Van Aerssen; this time he became so popular at Court that King James actually knighted him. After his father's death, Huygens returned to Holland and settled down, marrying his own first cousin, to whom he had been long devoted, and to whom he had actually written English verse. The couple were blessed with five children, when suddenly the wife died, and he became as excellent a widower as he had been a good husband, for he always refused to marry again, and died still mourning for his wife at the ripe old age of ninety-one.

BOOKS OF CIVILITY.

M. Bonnafé, in his studies on the Renaissance, describes the old "Books of Civility," or as we should call them, "Manuals of Etiquette," and in this article those interested in mediæval social customs and usages will find numberless quaint and instructive details of how our well-bred ancestors behaved.

The same number contains an article on "Aerial Navigation," by M. Fleury, but he has not much new to say on the subject, rather recapitulating what has already been done in that direction, than attempting to foretell what the future will bring us.

OTHER ARTICLES.

As always, the *Revue des Deux Mondes* makes a great feature of personal memoirs. Thus we have in addition to Prosper Mérimée, extracts from the journal kept by François Ogier during the Munster Congress, a most curious manuscript recently discovered in the French National Library by M. Boppe, and some extracts from the Memoirs of Chancellor Pasquier, which will soon be published by the Duc d'Audiffret Pasquier.

The *Revue* of June 15th contains a history of chess and famous chess players, which cannot fail to be interesting to those who are proficient or wish to become proficient in the game, by M. Binet, who, it seems, has taken the trouble to obtain a kind of consensus of opinion on certain disputed points from the most noted players of the world.

In the same number the Vicomte de Vogüé describes in a few pages, written in exquisite French, and full of picturesque descriptions, a journey he took to Ravenna in May, which make the reader long to see the somewhat forgotten town where, as he says, the shadow of a great man still lingers, for it was here that Dante composed his "Paradiso," in a street which is still called Via Beatrice Alighiera.

THE CONTEMPORARY REVIEW.

THE ORIGINAL POEM OF JOB.

Dr. E. J. Dillon, who is now showing himself to be one of the most versatile of modern journalists, publishes a new translation of the original poem of Job, from which he has removed the prose prologue and epilogue, and cast out all the eliminations, including the speeches of Elihu, which have been introduced in later years. Dr. Dillon says:—

Competent critics are at one in affirming that the poem of Job is one of the noblest creations of mature and conscious art, not the sweet babbling of simple nature, recorded when the human race was young; that it belongs to the golden age of Hebrew literature, which coincides with the latter half of the eighth century B.C., and was written by a Jew, who, in order to deaden the force of the shock which his bold views, and still bolder language, were calculated to inflict upon his co-religionists, selected his hero outside the people of Israel.

Dr. Dillon holds that his translation is the restoration of the poem of Job to its primitive form. Dr. Dillon's article is based upon the results of the studies of his friend Professor Bickell. As Dr. Dillon incidentally remarks that the teaching of the old book is distinctly hostile to the doctrine of the future existence, it is likely to provoke some controversy.

THE RÔLE OF THE PUBLIC SCHOOL IN ENGLAND.

Writing upon the 500th Anniversary of the Founding of Winchester College, Mr. A. F. Leach calls attention to the influences which public schools have had in the course of political evolution. It is, thanks to them, that our progress has been by reform and not by revolution. He says:—

Wykeham's foundation has been successful enough in its primary object of turning out scholars to be bishops and chancellors. But its crowning glory is that it was the model for Eton and for Westminster, and in later days for Rugby and Harrow, and the rest. Winchester, Eton, Westminster, as being the earliest, have also had the greatest effect upon the politicians and politics of England. Their democratisation of the aristocracy, and aristocratisation of the middle class, mingled together from all parts of England, and meeting as equals in the most impressionable years of life, have had, we may conceive, no little influence in making progress smooth and continuous instead of catastrophic.

THE SPENCER-WEISMANN CONTROVERSY.

Mr. G. J. Romanes defends Weismann, and Professor Marcus Hartog condemns him. The subject is much too abstruse for summarising here, but Dr. Hartog, at least, expresses his conclusions in intelligible language—

We see that his theories have been shifted as often as a house in a Western city; that their positive objective basis is still as weak as ever; that they are condemned by the canon under which their author condemns Lamarck's doctrine; and yet that they involve a truly Lamarckian view of variation under one set of causes. During his ten years' campaign Weismann has, it is true, won brilliant successes in the field, which have invested him with rare prestige; but he has been forced from one set of outworks after another; and now his main camp is pitched on ground commanded in part by the enemy. Is not this full justification for those biologists who refused to surrender the position occupied by the older evolutionists, and fortified with consummate skill by Herbert Spencer and Charles Darwin, at the first summons of the hostile general?

The best paper in *Scribner's* is Mr. Clark Russell's account of "The Life of a Merchant Sailor." All that Mr. Russell writes on the sea is worth reading, and this paper is an excellent contribution to the series of which it forms a part. There are two articles upon the World's Fair and "Aspects of Nature in the West Indies."

JEANNE D'ARC AT DOMREMY.

THE MIRACLE OF THE MAID OF ORLEANS; OR, THE EVIDENCE OF THE SUPERNATURAL IN HISTORY.*

I ARRIVED at Orleans on Saturday evening, June 3rd, 1893. At midday I had read the inscription on the wreath affixed to the well-known statue of Jeanne d'Arc in Paris, proclaiming that Jeanne had been burnt as a heretic by the Bishop of Beauvais, on May 30th, 1429. The motive of the reference was obvious. To honour the Maid of Orleans was well; but to have a fling at the Church was better. I was destined, however, to have at Orleans a still more remarkable illustration of the tendency in modern France to make the career of the Maid of Orleans the battle-ground of contending factions.

Sunday, the 4th of June, was one of the glorious days which have been so numerous this summer. The great Cathedral was crowded in the morning with a congregation of which about one-sixth were men. The service, choral throughout, was exquisitely beautiful. How marvellous, that with such melody in the "poor man's opera-house," the poor man for the most part seemed to prefer the brazen clangour of the machine-ground music of the great fair, with its switchbacks, circuses, theatres, and merry-go-rounds!

THE FÊTE DIEU AT ORLEANS.

In the afternoon, the procession of the Fête Dieu was to start from the Cathedral and make the tour of the city. The front of the minster was gay with bannerets and escutcheons; a great altar draped in

crimson was dressed in the porch, and everywhere there was a profusion of flowers and evergreens. It was one of the great fête days of the Church. The residents along the line of route of the procession decorated

their houses, festooning the streets with evergreens, covering the walls with carpets and tapestries, and where those failed, stretching white sheets, to which they pinned rosebuds. A devout baroness had set up a shrine in her garden, and at the foot of the main street leading down to the river an altar was erected, its scarlet canopy looking very bright and pretty beneath the green trees, with the blue waters and yellow sands of the Loire stretching far behind. From all the parishes of the city children, flower-garlanded, in their Sunday finery, preceded by the young girls who had celebrated their first communion, in long gauzy veils of muslin, were hurrying to the afternoon service in the Cathedral, where they filled the nave with a billowy expanse of lawn-like purity.

THE ANTI-CLERICAL PROCESSION.

While watching the preparations for the procession my attention was suddenly arrested by a line of

processionists crossing the great bridge that unites Orleans with the southern bank of the Loire. There seemed to be about 200 or 300, with banners and band, and we judged that they were a belated contingent from one of the smaller parishes making their way to the Cathedral. It was not till next day that we discovered, from the local papers, that this was a rival procession, got up

STATUE OF JEANNE D'ARC AT PARIS.

* "Joan of Arc." By Lord Ronald Gower. London: J. C. Nimmo. 21s. net.

STATUE OF JEANNE D'ARC BEFORE ORLEANS.

nominally in honour of Jeanne d'Arc, but really as a protest against the Catholic Church. It was a very small affair. The clerical organ disdainfully declares that only eighty-three persons took part in the demonstration, which was reported to the length of three columns in the Republican organ; a fact which perhaps explains how it was the same journal could not even find room for a paragraph describing the procession of the Fête Dieu, in which some 5,000 persons took part.

A CATHOLIC PAGEANT.

This latter procession was, to the unaccustomed eye of the English visitor, worth coming to Orleans to see. There was such brilliance, such harmonious yet vividly contrasted colour, such poetry of motion, such melody of song. The flower-garlanded white-surpliced boys who, walking backwards, sprinkled with red rose-leaves the path of the advancing procession; the gorgeously-habited ecclesiastics pacing slowly before the Bishop, holding reverently the sacred pyx under the scarlet catafalque with its nodding plumes; and the long lines of white-veiled maidens, broken here and there by the sombre black of the motherly-faced nuns, made the tree-shaded quay of the Loire a scene of beauty that recalled far-away memories of the pageants of pagan Rome. There were emblazoned banners from all the parishes, heavy gilt crosses, gorgeous Swiss beadles resplendent in gold epaulets and facings, lines of young schoolboys in

scarlet petticoats with lawn sleeves, and everywhere lovely girls whose bronzed features and flower-decked hair gleamed through clouds of tulle. Here and there, at long intervals, bands were playing, but for the most part nothing was heard but the singing of the children. "Je suis chrétien" was the refrain of one hymn constantly repeated. It was a dream of artistic beauty; eye and ear alike were at once rested and inspired. When the host passed by every head was uncovered and every knee was bowed. After the Bishop came about 500 or 1,000 men singing reverently, singing all the time until the long procession wound its way back to the Cathedral door, where the crowd massed in the great square was very imposing and beautiful to look upon. Whatever else the Old Church knows or does not know, the experience of centuries has at least given it an unrivalled instinct for stage management.

JEANNE D'ARC AND THE FACTIONS.

Next day, looking over the *Républicain Orléanais*, I found the report of the proceedings at the rival demonstration, and learned then for the first time how fiercely the battle promises to rage over the memory of the famous Maid of Orleans. Republican committees have been formed in Paris, Orleans, and Rouen for the purpose of celebrating by a civic fête the martyrdom of the Maid. These civic fêtes are set on foot with the avowed object of pushing the anti-clerical propaganda, that is to say an anti-Christian propaganda. It must be admitted that as a weapon against the priests and the Church which is organised under the Pope, they could not have made a better choice than Jeanne d'Arc; but as a weapon against Christianity they could not have made a worse; for while the Church burnt her, her faith in Christ sustained her in spite of the Church. Jeanne was before everything a Christian, not in word only, but in deed; nor was Dumas blaspheming when he styled her "the Christ of France." She would have shrunk in horror from Dumas; but he expressed bluntly what all must feel who study her life. She was not the second person of the Trinity, but she was a Christ if ever woman was. She had all the distinctive notes of Jesus of Nazareth—regarding the carpenter's Son, of course, merely from His human side. Not merely was her life a sacrifice and her death a martyrdom, but her story is saturated through and through with the same miraculous element which leads so many critics to distrust the narratives of the four Evangelists. She lived and died in the constant presence of the invisible world, hearing the voices of angels and of just men and women long deceased. She had the gift of prophecy, and she worked miracles—not the less miraculous because she never shrunk from the use of human means to accomplish her end.

THE THESIS OF THE RATIONALISERS.

It is this element of the so-called supernatural about the Maid of Orleans which makes her story at this moment, even more than formerly, so supremely fascinating. Here we have the question raised by the rationalists brought to the test of science, and history, and the human conscience. If we may have Christianity without the miracles, we may have Jeanne d'Arc without her Voices. Those who claim, as did the orators of the Civic fête, that science and the democratic spirit have dissipated the Christian legend, naturally apply the same process to the story of their national heroine. But many of those who hold zealously to the miraculous element in the Gospel yet do not see that there is much more legal and unimpeachable evidence in favour of the miraculous element in Jeanne d'Arc's story, are inclined to rationalise

Jeanne all the more ruthlessly because of their reluctance to rationalise Christ.

M. Emile Corra, speaking at the base of Jeanne's statue, proclaimed that "in our time, when the theological spirit disappears before reason and the democratic spirit, scientific criticism has banished the marvellous from history as well as from all other domains of thought." The other orators denied the supernatural mission of Jeanne. They denied that she was inspired by Providence or by any intelligence outside her own heart, and they protested against her being converted into a personage of the "cold Catholic mythology." So far as they are concerned they do not intend to leave to the representatives of those who butchered Jeanne the exclusive right to exploit her glories for the benefit of the Church. With the last sentiment every one must sympathise. But it is another matter when we are asked to believe that Jeanne, the peasant girl of Domremy, enjoyed no inspiration from on high, had no communication with invisible beings, and, in short, had no providential or Divine mission entrusted to her care. "Jeanne," said M. Corra, "was not a mere rough peasant girl upon whom Providence had; breathed. She was a woman of a beautiful intelligence and a great heart, who devoted herself to her country, and who has a right to a place in our history like Louis XI., Henry VI., Richelieu, Danton, and Gambetta."

THE ISSUE.

There the issue is clearly defined. Was Jeanne a stone cut without hands from the mountain side for the purpose of being used in the hands of the Almighty to accomplish His chosen ends and manifest His omnipotent power by her very weakness and natural unsuitability for the task; or was she a woman of genius whose achievements were the natural result of the application of her native unaided powers to the accomplishment of a task that lay within range of mortal capacity? That is the issue which the French are debating among themselves. That is the issue to which, in the lull of polemical discussions over the authenticity of Gospels and the nature of Christian evidences, we in England may profitably devote some little thought. If the former hypothesis be correct, then Jeanne d'Arc and her mission belong rightly to the order of the so-called miraculous as much as Moses or David or Jesus Himself. Their range differs, but their action within the range in which they did operate is as inexplicable by what men regard as the ordinary laws of Nature and of life

as the firing of a cannon ball can be explained by the hurling of a stone from a sling.

WHAT IS "SUPERNATURAL"?

Here let me interpose, for fear of misunderstanding, to premise that I use the word miraculous in the popular vulgar sense which would justify the application of the term miraculous to an explosion of gunpowder by those totally ignorant of the uses of villainous saltpetre. To me there is nothing supernatural, nor is there any miracle, in the sense of an arbitrary infraction of Divine law. One is the Law and one is the Lawgiver. Nor does the best authenticated miracle in Holy Writ speak to me so forcibly of Divine wisdom and omnipotence as the silent operation of the cosmic force by which, in a few short weeks, a tiny seed blossoms out into square feet of fragrance and beauty; or a small package of albumen and yolk inside a fragile shell is converted into the iridescent plumage of the humming bird, or a living mechanism of flesh and feathers which is capable of producing the song of the nightingale. Whether Jeanne be accounted for on one hypothesis or the other, she is to me equally the instrument and handmaid of our Father. These discussions, therefore, whether of Jeanne or of Jesus, for me merely relate solely to the means He saw best to employ, and whichever conclusion is arrived at, does not affect the central fact.

THE MIRACLE AS ADVERTISEMENT.

But there are others—possibly in all ages the majority of men—to whom if you can prove that anything has happened according to natural law, familiarly functioning around them, to-day as yesterday the same, it is as if you shut out God from His universe. They will only begin to admit

the reality of His existence when startled by the occurrence of something outside the regular and unwonted sequence of events. The phenomenon of birth is more marvellous than the mere return of life to a body from which the breath has departed. But births occur so constantly under certain conditions as to enable them to be generalised into the working hypothesis which we call a law of nature. Whereas the raising of a body from the dead—although it also might, had we but sufficient data, be reduced to its proper place among phenomena naturally recurring under certain conditions at present unknown—has occurred so seldom, and is so opposed to the working hypotheses which we call laws, that it has usually been the supreme advertisement of

STATUE OF JEANNE D'ARC AT ORLEANS.

the founders of new religions. The quality of advertisement which it possesses in a supreme degree is possessed more or less by all the so-called supernatural or miraculous phenomena, so hateful to the narrower scientists, who are only a shade less bigoted and ridiculous than their predecessors in dogmatism who asserted with equal vehemence that the Thirty-nine Articles were a comprehensive solution of the mystery of the universe. These advertisements of Providence startle men out of their smug complacency, and compel them to recognise the birth of the Infinite Invisible, of the nature of which we know about as much by our microscopes and spectroscopes and other meteyards of science as the dwellers on the European coastline knew in Jeanne's time of the American continent.

WHAT DOES JEANNE PROVE?

Was Jeanne such an advertisement? Was her career a proof of the existence of a higher power, of an Invisible Intelligence operating apparently from outside the material

visible universe; a power with volition apart from our own; a power not ourselves, and yet a power which makes for righteousness? These questions, if answered in the affirmative in Jeanne's case, have an obvious importance from their bearing upon the whole question of Christian evidence. There are obvious advantages in changing the venue, so to speak, of the trial of the case from Palestine to France. The events are nearer to our own time. When St. Augustine began his Christian apostolate in Canterbury, about as many years had elapsed since the Crucifixion as have passed since the deliverance of Orleans. The facts are beyond dispute. All the conditions which are insisted upon as indispensable to valid evidence by those who repudiate as insufficient the testimony of the witnesses of the Resurrection and Ascension, are supplied in the case of Jeanne. No one disputes the resurrection of France which was brought about by her mission. As little doubt exists as to her character, and as to the exact words in which she explained her own idea of the nature of her mission.

A prolonged and painstakingly malevolent inquisition into her acts and deeds and thoughts has supplied us with the most unimpeachable evidence, her enemies and executioners being both collectors of the testimony and the custodians of the records. The work was not done in a corner, it was accomplished under the eyes of the world. It gave an immediate and definite change to the whole course of the historical development of the two greatest of civilised nations. It is so living and palpable a force to this day, that the contending factions in France wrangle over her name, and celebrate the anniversaries of victories and of her martyrdom as if they were red letter days in the calendar of France.

THE SIGNIFICANCE OF THE QUESTION.

It is therefore evident that much may be gained in the way of elimination of doubtful and non-evidenced matter if for a while we leave the well-worn arena of the Annunciation and the Resurrection, and consider seriously whether Jeanne d'Arc is not sufficient to prove the existence of a higher Power in communication with mortals whose presence is not cognisable by the ordinary senses. If Jeanne's career proves this, the demonstration will be to the general combat between the forces of Belief and Unbelief what Jeanne's capture of the Tourelles was to the relief of Orleans. The Tourelles was only an outwork, but when the Maid ejected its garrison the siege of Orleans was raised.

The story of the Maid of Orleans—which Lord Ronald Gower has just told in English in the delight-

JEANNE D'ARC AT THE CHURCH OF ST. CATHERINE DE FIERBOIS.

ful volume published last month by Mr. J. C. Nimmo—has long been recognised as one of the most fascinating and enthralling of all the tragedies of history; not inferior in pathos to any narrative in any literature, sacred or profane, and the whole drama pivots upon one single point—the reality of the Voices heard by Jeanne. Deny that, and the whole narrative becomes simply incredible.

IN THE CHURCH AT JARGEAU.

I began this article in Orleans, beneath the shadow of the Cathedral in which Jeanne rendered thanks to God. I am finishing it in the Church of Jargeau, where she achieved one of her most famous victories. Sitting in the choir of the old church, I see emblazoned before me, in windows gorgeous with colour, the great saints and warriors of the Church. There is St. Michael, with his spear transfixing the dragon; St. Eustache, with the sword and the pen; Francis Xavier, missionary of the cross; St. Veranus, chaining a dragon; St. Antanns, St. Maculfus, St. Vincentius, St. Prosper, and the Virgin proclaiming the Immaculate Conception. But none among the whole bejewelled and behelmed hierarchy appeals to me as does the window of Jeanne d'Arc, which looks down upon me as I write in one of the carved oak stalls of the spacious choir. Alone among the saints and martyrs she has no halo. St. Prosper is

But in the silence of this stately nave, silence unbroken save by the twittering of the swallows who now, as five hundred years ago, unaffected by wars and revolutions, hawk for flies around the church, I seem to hear the voices of the past, full of meaning for the present and of promise for the future.

WHAT THINK YE OF THE MAID?

And these voices issuing from the dusky expanse of the past centuries ask, "What now think ye of the Maid? Explain this miracle by your psychology and your sciences! Say how was the deliverance of Orleans effected and France freed from the English yoke by a letterless lass of eighteen years? Who gave her the fore-knowledge of things to come which enabled her to read the future as an open book? Who taught her the art of war and enabled her to transform a huddled mob of sheep into wolves of war, so that the victors of a hundred years were humbled in the dust before the standard of a peasant maid, and the leopards of England were chased before the Maid bearing the white standard of the lilies of France?"

And I can only answer to this appeal by admitting that Jeanne was the agent in the hand of invisible powers, and that her miracles were accomplished by the agency of spiritual forces, whose potency and range cannot

JEANNE D'ARC DEPARTS TO SEEK THE KING AND TO SAVE ORLEANS.

[at Orleans.

upon her right hand, with his mitra and his episcopal staff; St. Eustache upon her left, with his quill and his weapon of war; while in front glows with eternal youth the great St. Michael, archangel of the hosts of heaven, patron saint of the armies of France and special guide and inspirer of Jeanne d'Arc. The Maid is not unworthily placed. She clasps her sword in her left hand, while in her right she holds the standard which she loved forty times more than her sword. And the light streams in, through her patient eyes and firm set features, upon the church which, 464 years ago this very day of June, she captured for France.

THE VOICES OF THE PAST.

June 12th, 1429, was the day of the storming of Jargeau on the Loire. June 12th, 1893, I have cycled over from Orleans, and alone in the great old church am writing these concluding words. It is fair and bright outside. The Loire runs low with the endless drought; the barley is ripe in the fields; the old windmills are whirling their arms briskly in the pleasant wind, and the swallows flit around the old church tower, which stands almost the only surviving monument of that ancient time. Of Jeanne in Jargeau there seems no trace or living remembrance save this window of stained glass; nor is there any sign that man, woman, or child remembers that it was June 12th when the Maid drove out the English and freed Jargeau from the foreign yoke.

be measured by the dynamics of material science. I do not say necessarily either of God the Infinite, the Almighty, and the Omniscient, or of Satan the Anti-God, as if outside the domain surveyed by our five senses there remained but two agencies or powers—the Infinite Holy One that inhabiteth Eternity, and the almost Infinite Unholy whose abode is in the Abyss. Such a conclusion would be to the last degree unscientific. All that we can say of a certainty is that the Maid of Orleans was endued with gifts and graces and capacities which were not natural to the shepherdess of Domremy, nor, indeed, could be acquired by an unlettered peasant girl, any more than the apostles could have attained by aid of the grammar and the dictionary the gift of tongues which they received at Pentecost.

WHENCE HER CAPACITY?

Whatever else is uncertain, this at least is clear—military genius, the supreme gift of great commanders, the technical mastery of the art of directing artillery fire, of planning campaigns, and the gift of foreseeing their exact duration and result, these things can by no theory of psychology be supposed to be latent in the mind of an enthusiastic village girl, who had neither learnt to read, to ride, or to command before she was launched against the English, to their utter undoing. Mr. Myers is fond of ascribing genius to the uprush of the subliminal consciousness; but no uprush from sub-

From a Bas-relief]

JEANNE D'ARC RECOGNISES THE KING AT CHINON.

[at Orleans.

liminal regions will explain the sudden possession by a peasant girl of the technical knowledge of a master of artillery. Of the fact that Jeanne had these gifts there is no dispute. Apart from the fundamental and unmistakable fact that she brushed away the English masters of France as if they had been flies, the ablest generals on the French side formally testified on oath to the process of rehabilitation to the extraordinary genius which she displayed in war. The Duc d'Alençon made the campaign of the Loire by her side. "In everything," he said, "excepting the making of war, she was as simple as any other young girl. But in war she was very skilful, either in the bearing of the spear or in mustering an army, in appointing the order of battle, or in disposing of artillery. All were astounded to see her display the skill and foresight of a captain exercised by a practice of twenty or thirty years of war. But they admired above all her use of artillery, where she had a consummate ability." Now, a supreme capacity to use artillery is no more latent in the subliminal consciousness than a mastery of Greek or Latin or Hebrew. Neither is the ability to manœuvre thousands of troops of all arms in such fashion as to secure victory, when the ablest tacticians of the day deemed it hopeless, explicable upon any other theory than that of the direct communication to the mind of Jeanne of the superior wisdom of a higher mind. If your servant-maid were to return from marketing with her pockets stuffed with gold and jewels, it would be as reasonable to attribute their presence on her person to the spontaneous generation of some latent power of the mind, as to explain the military genius of Jeanne to the uprush of the subliminal consciousness.

WHAT IS THE EXPLANATION?

Whence then came these gifts? To say that they came from God is not to answer but to evade the question. All good gifts come from God, but they reach us usually by intermediaries, whose action can be traced with some degree of precision. How then did Jeanne receive her sudden and miraculous accession of military genius? I lay stress at present solely upon her admitted capacity to lead troops, to use artillery, to direct campaigns. I say nothing for the moment of her prophetic gifts. If a Suffolk ploughboy, fresh from the ploughtail, were to be suddenly put on board a modern ironclad on the eve

of a great battle, every one would admit that it could only be by a miracle if he should display in manœuvring and fighting that great conglomerate of complex machinery, the naval genius of Nelson or the skill of Admiral Hornby. Yet for an illiterate maiden of eighteen, who had never sat in a saddle or worn armour, to command an army of 10,000 men, with such consummate success as to destroy the established power of the English in France,

was not less extraordinary, not less demanding a miraculous or supernatural explanation. What then is that explanation?

A HOMELY ANALOGY.

I referred just now to the analogy of a servant

THE MAID AND HER STANDARD.

maid going a-marketing with a few pence and returning with her pockets stuffed with gold and jewels. What course would be adopted in such a case to ascertain the source of this extraordinary accession of wealth? Clearly the first and most obvious step would be to interrogate the girl herself! How came she to be in possession of such treasures? And in default of better evidence as to their source, her testimony, however incredible, would deservedly be accepted. Suppose she said that they dropped down from the skies, or that she found them growing in a cabbage, the natural conclusion would be that she had stolen them and was lying to conceal the fact. But if, after the most careful and minute examination of all the witnesses who could possibly throw any light upon her movements, it was proved incontestably that there was no other possible source from which she could have received them, except direct from the sky or from the heart of a cabbage, then, if the existence of the treasure were undisputed, we should be driven to accept the testimony not as necessarily true, but as supplying the only hypothesis by which her possession of the treasure could be accounted for. So it is with Jeanne. No one denies that she suddenly became possessed of an altogether abnormal genius for war. The proof that this was the case is overwhelming. It is supplied, in the first

WHAT IS THE RATIONALIST HYPOTHESIS?

A hundred years have elapsed since the worship of Reason was established in France on the ruins of the old religion which Jeanne loved. In our own day, as the authoress of "Robert Elsmere" glibly teaches, all belief in the miraculous has disappeared from intelligent circles. But, as I see in the stained window of the church in which I am writing, the old religion still holds its own, and exalts the heroic Maid among the saints and fathers of the Church; and, at the same time, Atheists vie with Churchmen in making processions and orations in her honour. How comes it that these factions, bitterly hostile in all things else, should agree in the culte of Jeanne d'Arc? That in itself, after the lapse of five centuries, is almost as remarkable as the deliverance of Orleans or the victory of Patay. But what explanation can the rationalists and materialists of our time give of Jeanne's suddenly-acquired military genius—a thing as inexplicable, surely, as the gift of tongues? There is no explanation. Natural genius may account for much, religious enthusiasm for more; but as neither natural genius nor religious enthusiasm will teach the unlearned how to conjugate irregular verbs, so these great qualities are as incapable of imparting to a village lass the art and mystery of the profession of arms.

From a Bas-relief

[at Orleans.]

RAISING THE SIEGE OF ORLEANS AND THE CAPTURE OF THE TOURELLES.

place, by the fact that, at the outset of her career, she was uniformly opposed by all the experts and veterans who commanded the King's troops, and that she as uniformly succeeded, by dint of a series of almost unprecedented victories, in convincing all these experts that they had been mistaken. And it is attested, in the second place, by the fact that the English, the bravest and most victorious fighters of the century, were so absolutely convinced that Jeanne wielded supernatural power, that not all the authority of the King, expressed by repeated ordinances, could induce their soldiery to take the field against the Maid. It may be said that these were superstitious days, and that a reputation for sorcery was easily established. But Jeanne's reputation was established, not by magical incantations or any occult pretensions, but by the matter-of-fact method of driving conviction into the national heart—the simple but effective method of chasing the English armies in headlong rout, whether they fought in the open or sheltered themselves behind all but impregnable ramparts. Two nations, her own and the enemy's, agreed five hundred years ago in believing that Jeanne's capacity and Jeanne's achievements could not possibly be due to any but a supernatural source. France held that they came from God, England from the Devil. Both agreed in believing that they were not and could not be the natural endowment of a Domremy shepherdess.

WHAT JEANNE DID.

Remember that the English in France at the beginning of 1429 were to the French what the Germans were at the beginning of 1871, only more so. Talbot, the English Achilles, was as great a military authority as Moltke, and the victories of Verneuil and Poitiers and Agincourt and the Herrings were as decisive as those of Sedan and of Metz. After a war of a hundred years the dominance of England had been accepted almost as a decree of destiny. Only eight years before a solemn treaty made over the crown of France to the English king. English garrisons were in Paris and Rouen and Bordeaux. English authority was supreme over more territory than the Germans covered even in their most venturesome marches. The French had neither money nor men nor sovereign nor prestige. Their nominal king was a vacillating incapable. His councillors dreaded success even more than defeat. Yet out of the midst of this hopeless prostration Jeanne arose, and in the course of a single year she had transformed everything. She delivered Orleans, crowned the king, broke the prestige of English victory, and in short re-created and regenerated France. How can we account for this incredible series of achievements wrought by the hand of this peasant girl, who in her own phrase did not know A from B, but who accomplished the salvation of France?

HOW JEANNE EXPLAINED IT.

Ask Jeanne, and hear what she says! Jeanne has no doubt, no indecision. Jeanne knows. She knows that it was not in her own strength she did her great marvel; she shrinks from the assertion as a blasphemy. She was enabled to do it by an invisible intelligence whom she called My Lord the King of Heaven, who communicated His will to her by the direct word of St. Michael the Archangel, St. Catherine of Alexandria, and St. Margaret of Scotland. Jeanne may have been mad, but she delivered Orleans. She may have been a mystic, a visionary, and a superstitious fanatic, but she rid France of the English conqueror. And Jeanne, the Maid of Orleans, the victor of Jargeau and Patay, never ceased to affirm that she received all her knowledge and all her capacity direct from St. Michael and the other saints. And as no one to this day has ventured to suggest any other possible hypothesis to account for this incredible phenomenon, is it unreasonable to ask that in this matter we should believe Jeanne?

HER VOICES.

I do not say that it is necessary that we should believe that Jeanne was correctly informed as to the identity of the invisible Guides who gave her the counsel which enabled her to baffle the sagest of the English captains. All that I ask is that it is evident, seeing Jeanne had not the knowledge in herself, she must have received it from some one else, and as there was no visible being who could communicate it, are we not of necessity driven by a strictly scientific process of induction to believe that she must have received the information from invisible beings? Jeanne believed that she could identify them, and named them with the utmost confidence. They were not, she declared, either invisible or intangible to her. She heard them at first as voices, but then she saw them as persons, and afterwards embraced them as friends. But I am not concerned to demonstrate the accuracy of her nomenclature. All that I ask is that it should be admitted that some power not her own, and not discoverable by the five senses of mortal man, did communicate to her the capacity by which she astonished the world.

HER PROPHECIES.

The argument in favour of this conclusion is much strengthened when we come to consider, not merely the capacity of Jeanne to do, but the ability of Jeanne to foresee. Here we are on firm ground. It is admitted by no one more than the most confirmed materialist that the gift of prophecy is not innate in the human mind. But Jeanne undoubtedly had the gift of prophecy. She prophesied not after, but long before the event, and her prophecies came true—with one or two exceptions. The evidence in her case is certainly quite as irresistible, to say the very least, as that of any of the prophecies which figure so largely in evidences of Christianity, down to quite recent times. Nor does she prophesy probable things. To state the fact in vulgar parlance, no one

JEANNE D'ARC AT THE TAKING OF THE TOURELLES, MAY 8TH, 1429.

would have been so mad as to risk a bet on the chance of their fulfilment even at a hundred to one. When she was a child by the spinning-wheel she foretold her journey to the king, and her mission to deliver France. When she was not eighteen she foretold that she would deliver Orleans and conduct the king to Rheims to be crowned. Before she went to Orleans she predicted that she would be wounded, and on the evening before she specified that the wound would be above her breast. When the operations began for raising the siege, she predicted that she would clear out the English in five days, which was fulfilled to the letter. When the most experienced captains declared that the Tourelles could not be reduced in less than a month, she foretold its capture next day, and it took place. She foresaw the death of a horseman of the guard at Chinon a few hours before it happened; of Lord Scales, two days before he fell, and she foretold her own decease at the end of a year. She warned the Duke d'Alençon to avoid a cannon ball, which slew the gentleman who took his place, and she predicted with the utmost confidence the result of the battle of Patay before a shot had been fired. For a similar series of prophecies so well attested, so precise, and so incredible at the time they were delivered, we may search in vain in sacred or profane history.

HER LIMITATIONS.

Nor is her claim to forevision at all vitiated by the fact that she declared she would enter Paris and drive the English from France, whereas it was not until seven years after her death that the spirit which she had evoked in France secured the expulsion of the English. Nothing is more notorious in all prophetic writings than the difficulty of fixing time. Clairvoyants in every age, and in our own time, see things of the past, the present, and the future as it were inextricably intermingled. Time, in our sense, does not exist on the other side. Only very rarely, and more frequently in Jeanne's case than in any other, the gift is added of discerning times and seasons. I need not allude to the absurd objection that Jeanne was not a prophetess because she did not foresee that she would be burned to death, for such a cavil is only possible to those who have not grasped the fundamental difference between a person to whose gaze all future things lie exposed, and one to whom from time to time certain specific events still in futurity are revealed. No one has ever claimed, and Jeanne least of all, that she had drawn aside the veil of the future. All that she asserted was that her Voices, or her Guide (*conseil*), did from time to time make definite communications as to what was about to happen, and that the event proved that she was right.

IF TO SAMUEL, WHY NOT TO JEANNE?

Was she wrong? I do not care to argue this question with those who say that they believe not on authority, but as a matter of reason, that communications from the invisible world were made to the prophets and apostles and saints and seers of whom we read in Holy Writ. I am not now arguing the question of the quality or the importance of these communications. I am only concerned with the fact of their occurrence, and it seems to me that the evidence that voices out of the invisible spoke to Jeanne d'Arc, and that she saw angels and the forms of holy women long since dead is, to say the very least, quite as well evidenced as the fact that Moses heard the voice of God from out the burning bush, that Samuel, as a child, heard the voice that foretold the destruction of Eli's sons, or that Peter and John saw the sainted forms of Moses and Elias on the Mount of Transfiguration.

EXPLAIN THIS MIRACLE.

But I am concerned to press this matter home to those

who reject all miracle and all inspiration, and who deny that there is any world other than this material sphere of which we take cognisance by our five senses; and who affirm that there are no intelligences with which man can communicate other than those he can see with his eye, hear with his ears, and touch with his hands. To them I would say, Account for Jeanne d'Arc! Explain the miracle of the Maid of Orleans! On

TRIUMPHAL ENTRY OF JEANNE D'ARC INTO ORLEANS.

her own hypothesis, which assumes the existence of a world which you deny, and of intelligences which you ignore, it is not difficult to account for what occurred. Some spirit, or spirits, of higher than mortal intelligence, with a capacity more than human of seeing into the future, were in constant communication with her. She spoke their words and acted upon their counsel. We have, in short, not to deal with Jeanne d'Arc as a single personality, but Jeanne d'Arc inspired, directed, and controlled by a higher mind, or minds, of whose existence and whose influence upon her she was constantly conscious. On that assumption, her hypothesis explains everything. But deny that assumption, and what remains? A manifest miracle, an inexplicable incredibility, in which, nevertheless, with the facts of history before us, we must believe.

JEANNE.

From such a conclusion human reason recoils. Better a thousand times accept any working hypothesis provisionally that will account for the facts, than give up the whole problem as insoluble, merely because we have an inveterate prejudice against admitting the existence

of another world than that whose inhabitants, though invisible to mortal eye, nevertheless exercise a constant and sometimes dominant influence upon the affairs of men. It is this which gives the story of Jeanne d'Arc its incomparable fascination to modern times. In itself it is a history of unequalled pathos. No myth of Greece or Rome, no fairy tale of the Christian hagiology can vie with the tragic horror and transcendent beauty of the story of the Maid of Orleans. Jeanne incarnates all that is loveliest in womanhood with all that is most admirable in man; she unites the virtues of the cloister with the romance of the camp. She was as tender and true as our own Douglas, but as brave as Deborah. She bore herself with equal charm in the cottage by her spinning-wheel and in the Court of the King. Misfortune did not disturb the serenity, nor victory spoil the humility of this superb soul. To have given birth to such a woman was an atonement in advance even for the crime of producing the author of *La Pucelle*, or Napoleon the devastator of Europe. As long as the human heart endures, the narrative of her captivity and her burning will rouse feelings that lie too deep for tears, and compel the English people and the Roman Church to admit that they have shared in the greatest crime in history since that which stands to the account of the Jewish Sanhedrim and the Roman proconsul for the Crucifixion. But all that is as a tale that is told, interesting, mournful, tragic enough, but it is a thing of the past.

THE LESSON OF IT ALL.

What is not of the past but of the ever-living present is the light which Jeanne's story throws upon the absorbing problem of life in this world and the next. For if Jeanne was correct, we who live, and move, and have our being in the midst of these temporal things, which are but for a day, are all the while in the con-

stant presence and within possible communication of spiritual Intelligences infinitely higher than ourselves. With these Intelligences it is permitted and even commanded that we should enter into close relations, as it is through them that our Lord the King of Heaven may deign to give us those directions necessary for our well-being and for the deliverance of those about us. Nor must we be deterred by the fact that those who said of Our Lord that He cast out devils by Beelzebub the Prince of the Devils, and who burnt alive as a sorceress the purest and noblest and most pious of women, will also invoke against those who keep their soul's eye open on the Godward side, the familiar cry of Sanhedrim and of council, that it is all of the devil or that they are mad. For if there be a God, Lord not only of all the Earth but of the Heaven and of the Heaven of Heavens, who is encompassed about by an infinite multitude of pure and lofty Intelligences, who are all ministering spirits to those who are called to be sons of God and heirs of heaven, what unfaith is there not latent in the shallow and empty cry that everything that is manifestly inexplicable on material grounds is of the Evil One! Is He who inhabiteth Eternity limited solely to the governance of material things, or is He not rather the Lord of all the spirits of all the worlds? Evil spirits there are no doubt, as there are evil men on this earth; and for those who dare not face the influence of their fellow-men the Roman Church has prepared the cloister, in order that they live retired and apart from the world. But why should we carry this cowardice of the cloister into the region from which, in the future as in the past, it may please the Almighty to reveal His will to the children of men? As for those who cry *cui bono?* it is enough to ask, What would have become of France if Jeanne d'Arc had closed her ears to her Voices, and rejected their counsel as temptations from hell?

PRIZES FOR AUGUST AND SEPTEMBER, 1893.

THE following Prizes are offered for competition to the Readers of the REVIEW OF REVIEWS. For conditions see last month's issue.

AUGUST 15. SUBJECT—THE LANTERN MISSION.

- £5 5 0 for the best lantern lecture, occupying about forty-five minutes in delivery, suitable for popular Sunday service, with list of at least twenty-five pictures illustrating the lecture. If pictures, photographs, or slides are sent in for this competition, they will be returned when adjudicated upon.
- £1 1 0 for the best list of pictures illustrating Heroism and Self-sacrifice; references to place where they can be found, and brief descriptions of their subject, in all cases to be given.
- £1 1 0 for the best three slides illustrating any familiar hymns.
- £1 1 0 for the best half-a-dozen photographs, by amateurs, suitable for reproduction as lantern slides; any subject.
- £1 1 0 for the best short story for children, original or selected, with twelve illustrations suitable for slides.
- £1 1 0 for the best half-a-dozen humorous slides, original or selected.

SEPTEMBER 15. SUBJECT—HOW TO IMPROVE OUR TOWNS.

- £5 5 0 for the best and most practical paper setting forth a realisable ideal standard for an average town of about 50,000 ordinary inhabitants, dealing with government, sanitation, education, recreation, etc. Nothing to be proposed that has not been actually realised somewhere under somewhat similar conditions.
- £1 1 0 for the best list of the most useful publications dealing with the improvement of town life, specifying price and nature of their contents.
- £1 1 0 for the best short story, not exceeding 2,000 words, taking the contrast between real and ideal town life as subject.
- £1 1 0 for best narrative of the personal experience of the writers, setting forth what conditions or institutions in the town in which they lived have most helped or most hindered them in their life.
- £1 1 0 for the best half-a-dozen photographs by amateurs of what they are proudest of in their own town.
- £1 1 0 for the best answer to the question, What gives me most hope for the improvement of my town, and what am I doing to help it on?

THE CHRONICLE OF THE CIVIC CHURCH.

HOW TO TEACH CIVIC DUTY.

By MR. BRYCE.

In December, 1892, Mr. Bryce delivered an admirable address to the London Association of the Head Masters of Public Schools, upon the duty of inculcating patriotism in schools. I am very glad to see this address re-published in the *Contemporary Review* for July.

DIFFICULTIES.

The sober, quiet sense of what a man owes to the community in which he is born, and which he hopes to govern, has been found specially hard, says Mr. Bryce, to maintain in modern times and in large countries. It is comparatively easy in small republics or in cities, but with a vast population the individual is lost in the multitude. Then, again, the piping times of peace are not productive of such heroic incidents as times of war, and, in the third place, party spirit overlays, if it does not supersede, national spirit. But Mr. Bryce exhorts us to remember that civic virtue is not the less a virtue because she appears to-day in sober grey. How then can civic virtue in sober grey, or otherwise, best be inculcated by schoolmasters? Mr. Bryce answers this question as follows:—

METHODS.

We must cultivate three habits. To strive to know what is best for one's country as a whole. To place one's country's interest, when one knows it, above party feeling, or class feeling, or any other sectional passion or motive. To be willing to take trouble, personal and even tedious trouble, for the well-governing of every public community one belongs to, be it a township or parish, a ward or a city, or the nation as a whole. And the methods of forming these habits are two, methods which of course cannot in practice be distinguished but must go hand in hand—the giving of knowledge regarding the institutions of the country—knowledge sufficient to enable the young citizen to comprehend their working—elements which still dazzle imagination from the conflicts of fleets and armies of the past.

SUGGESTIONS.

Mr. Bryce then condescends upon details, and makes some practical suggestions as to the way in which patriotism should be taught in schools.

The pupil should be made to begin from the policeman and the soldier whom he sees, from the workhouse and the school inspector, from the election of the town councillor and the member of the Legislature which, if he be an American boy, he will see pretty often, and about which, if he be an English boy, he is likely to have heard some talk. The old maxim of Horace about eyes and ears ought never to be forgotten by the teacher either of geography or of history, or of elementary politics. An ounce of personal observation is worth a pound of facts gathered from books; but the observation profits little till the teacher has laid hold of it and made it the basis of his instruction. I must therefore qualify the warning against details by adding that wherever a detail in the system of government gives some foothold of actual personal knowledge to the pupil, that detail must be used by the teacher and made the starting-point from which general facts are to be illustrated and explained.

Current history, or elementary politics, Mr. Bryce thinks, would be easier to teach than history in the usual sense of the term.

HISTORY AND POETRY.

So much for giving instruction. A much more important side is that of stimulating interest in public affairs and inspiring a sense of civic duty.

If well-written historical narratives, fresh, simple, dramatic, were put into the hands of boys from ten years onwards, given to them not as task books but as books to read for their own pleasure, not only would a good deal of historical knowledge be acquired, but a taste would often be formed which would last on into manhood.

After good historical reading comes poetry, but, unfortunately, comparatively little of our best poetry runs in the historical and patriotic channel. In an eloquent passage, Mr. Bryce expounds and expands the principle upon which our proposed historical pilgrimage is based. When a man sees the spot where some great deed was done, he is roused to emulate the spirit of those who did it; but in England interest in national history is less than in most of the other countries.

THE WASTED WEALTH OF ENGLISH HISTORY.

England is much worse in this respect than either Ireland or Scotland. Mr. Bryce says:—

In England intelligent patriotism and historical curiosity are almost confined to the small well-educated class. Among the Nonconformists there still lingers a warm though (as it would seem) steadily cooling feeling for the Puritan heroes and divines of the Commonwealth. But with this exception, the middle class, scarcely less than the agricultural peasantry and the city artisan, care for none of these things. This is less true of the smaller nationalities within the British Isles. In Ireland the misfortunes of the country have endeared to the people names like those of Sarsfield, Wolfe Tone, Emmett, and O'Connell. Wallace and Bruce, Bothwell Bridge and Culloden, are more vividly present even to the peasant of Scotland than Harold (son of Godwin) or Hampden and Blake, than Agincourt or Fontenoy, or perhaps even Salamanca and the Nile, are to the average Englishman.

FAITH IN THE FUTURE.

But it is not only as to the past that our people need to be educated. We need to be instructed still more as to the immense possibilities of the future:—

The masses of the British people in these isles, and probably to a large extent also the masses of the people in our colonies, are still imperfectly familiar with the idea of a great English-speaking race over the world, and of all which the existence of that race imports. Till we have created more of an imperial spirit—by which I do not mean a spirit of vain glory or aggression or defiance—far from it—but a spirit of pride and joy in the extension of our language, our literature, our laws, our commerce over the vast spaces of the earth and the furthest islands of the sea, with a sense of the splendid opportunities and solemn responsibilities which that extension carries with it—till we and our colonies have more of such an imperial spirit, hardly shall we be able to create the institutions that will ere long be needed if all these scattered segments of the British people are to be held together in one enduring fabric. But if sentiment ripens quickly, and we find ourselves able to create those institutions, they will themselves develop and foster and strengthen the imperial spirit whereof I have spoken, and make it, as we trust, since it will rest even more upon moral than upon material bonds, a guarantee as well of peace as of freedom among the English-speaking races of the world.

THE BEST LIBRARIES FOR STUDENTS.—In the *Educational Review* for June, an American writer, describing the facilities offered a student in European libraries, says that the student will find they should be ranged in the following order of merit—from that point of view:—“Bodleian, British Museum, Munich, Brussels, Stockholm, Berlin, Stuttgart, the university collections, Paris. Of those at St. Petersburg and Rome I am not prepared to speak.”

THE SOCIAL QUESTIONS UNION, MANCHESTER. QUARTERLY REPORT.

THE quarterly meeting of the Council of the Social Questions Union for Manchester, Salford, and District, was held at the Y.M.C.A., Peter Street, Manchester, on Tuesday evening, June 27th, and was well attended. The Rev. Dr. Goodrich presided. The following report of the hon. secretaries of the Union was presented by the Rev. W. M. Westerby:—

WHAT HAS BEEN DONE.

Since the last meeting of the Council, on March 27th, the General Purposes Committee has met monthly. On April 11th twelve new members of the Union were elected. A sub-committee was appointed to deal with the question of forming ward committees for Manchester and Salford in connection with the Union. The hon. secretaries were instructed to put upon the agenda paper for the next meeting of the General Purposes Committee a resolution defining the attitude of the Union in respect to the drink traffic; and a sub-committee was appointed to make inquiries and arrangements for the appointment of a vigilance officer, subject to the approval of the General Purposes Committee.

On May 9th eight new members of the Union were elected. A resolution defining the attitude of the Union towards the drink traffic was adopted in the following terms:—"Upon questions of imperial policy affecting the drink traffic, this Union declares itself in favour of giving absolute power to the people in a given area to control the number of licences within that area." The appointment of a vigilance officer was made, and the date and place of the next Council Meeting were fixed.

On June 13th one new member of the Union was elected. The Temperance Committee was authorised to engage legal assistance in matters requiring to be brought forward at the next Brewster Sessions. The officers of the Union were instructed to oppose any application which the Palace Theatre of Varieties might make for a drink licence at the expiration of its present engagement with the City Watch Committee. The hon. secretaries were instructed to take steps with the view of drawing up a list of questions to be submitted to municipal candidates; and the reprinting of the pamphlet containing the constitution, officers, committees, and members of the Union, was authorised, the issue of it to be deferred until after the Council Meeting on June 27th.

The Rev. Canon Hicks then submitted reports from the departmental Committees of the Union.

TEMPERANCE.

The Temperance Committee has taken steps to procure returns from the Watch Committees of Manchester and Salford relative to the number of licensed houses which provide board and lodging, and the Salford Watch Committee has placed the particulars asked for at the service of the Union, but the consent of the Manchester Watch Committee has not yet been received. The co-operation of the Chief Constables of Manchester and Salford in matters affecting licensed premises has been sought, and, in the case of the Chief Constable of Manchester, has been promised. The report further dealt with work for which preparations are being made.

MORALITY.

The report of the Social Purity Committee showed that its strength had been much increased, and attendance at its meetings had been large. It referred to the appointment and work of the vigilance officer. Since April 1st seventeen brothels have been discovered, watched, and reported against. Five persons have been proceeded against by the police, two of whom were sent to prison for six months, two fined £20 and costs, one fined £2 and costs. Two children have been removed from dangerous surroundings. Two persons have been re-

moved from brothels and sent to their homes. Shops to which young people of both sexes resorted for gambling and other purposes have been watched. Two have been warned, and their objectionable practices have been suppressed. The vigilance officer is doing all that is possible for him to accomplish the purposes of the Committee. Manchester and Salford have been divided into districts, and each district placed in the charge of two vigilants for observation. At the request of the Social Purity Committee the Rev. R. A. Armstrong, B.A., of Liverpool, has visited Manchester, and had a conference with them, from which much advantage is hoped. Lady members of the Union are taking active interest in this department of its work.

GAMBLING.

The Report of the Committee on Gambling referred to the use of shops, etc., for betting, to raffles at bazaars, to foreign lotteries, and to the convictions lately secured by the police in the first-mentioned matter, and stated that methods and plans for dealing with these and kindred matters are being matured.

In the absence of official reports, statements were made by members of the other Committees of the Union, which showed that active steps are being taken to deal with the problems confronting each.

OTHER BUSINESS.

The Treasurer, Mr. John F. Haworth, reported that since January last the total receipts to date amounted to £68 9s. 6d., and the total payments to £64 6s. 0½d. Accounts delivered but not yet paid amounted to £3 9s. Eight new members of the Union were elected. As an instruction to the Committees of the Union, it was proposed by Mr. Gilbert Kirlaw, seconded by Mr. Buss, and resolved—"That the Committees be requested to collect, as far as possible, information as to how far the work they have in hand is already undertaken by other organisations in Manchester and Salford, and to report to the General Purposes Committee or Council."

THE HELPERS AT LIVERPOOL.

MR. JOSEPH EDWARDS, 64, Carter Street, Liverpool, Secretary for the Liverpool Association, asks for more helpers. A plan of campaign for the winter months is in course of preparation, and a directory is being compiled of all the social centres at present at work. It is to be hoped that social workers in Liverpool will communicate with Mr. Edwards.

OLD SWAN.—The "Social Scheme," which was initiated in February, 1892, is doing good work, and deserves success. In addition to the building of a "People's Hall," now in progress, there are several branches of social work actively carried on. The "Scheme" is divided into sections, viz.:—(a) Vigilance, devoted to suppression of gambling saloons, temperance matters, and general social work; (b) Entertainment, for supplying penny concerts and lectures; (c) Buildings, a company formed for acquiring a "People's Hall." The last-named has bought the old police buildings in Prescot Road and structural alterations are being proceeded with. So far all the money required has not been raised, but it is hoped that this difficulty will soon be surmounted. At present the entertainments are being held in a room over a stable belonging to a public house. Already the police say that the improvement in the neighbourhood on "concert nights" is very marked. The hon. secretaries are Messrs. J. Houlst, junr., and I. E. Atkinson, and the secretary for the "People's Hall Co.," Mr. Clough.

THE BRIGHTON CIVIC CENTRE.

THE HOUSING OF THE WORKING CLASSES.

THE Brighton Civic Centre, as I stated last month, has taken action on the subject of the Housing of the Working Classes. It has issued the following circular to the ministers of religion, medical men, and trades unionists, which may be useful to Civic Centres elsewhere:—

The Brighton Civic Centre wishes to place before you and their fellow townsmen generally the desirability of the municipality of this town undertaking the erection of artisans' dwellings.

Brighton largely depends on its reputation as a health resort, and it is of importance to all interested in the town that a low death rate should be maintained. Unfortunately, the overcrowded state of the artisans' dwellings, and in many cases their unhealthy character, run up the death rate far beyond its normal level.

Thus, whilst the greater part of Preston had a death rate under 10 per 1,000, a portion of the poorer parts of the town has shown a mortality of over 36 per 1,000.

The same state of things, produced by the same causes, existed in Liverpool, Glasgow, Edinburgh, and Birmingham.

The municipalities of these towns have, by the removal of unhealthy buildings and the erection of improved dwellings, greatly reduced their death rate. In Liverpool in the crowded districts the death rate was 40 to 44 per 1,000, but now, in the Corporation buildings, the death rate is about 20 per 1,000, less than one-half of the former rate.

At Edinburgh, by the removal of unhealthy dwellings, the death rate has been reduced from 26·26 to 19·94 per 1,000.

At Birmingham the death rate in some of the worst streets was from 40 to 97 per 1,000, and that for the whole town nearly 24 per 1,000; but this has been reduced to 19 per 1,000 by the same means.

The report of the Medical Officer of Health shows how very needful it is for immediate steps to be taken in the same direction in Brighton.

One of the Brighton Town Councillors writes under the date of February, 1893:—"We must have more houses. The overcrowding in our poorer districts is disgraceful. I know one instance (and there are many nearly as bad) of a man and his wife and six children all living in one low room 8 feet by 10 feet."

The enclosed report on the dwellings of the poor in the Pier Ward supports the views of this town councillor.

Whilst the need of better dwellings is admitted, all are not agreed that it is absolutely necessary that the municipality should take upon itself the duty of providing a certain proportion of wholesome dwellings at a reasonable rate for artisans and labourers. The feeling amongst some has been that this might be left to private enterprise. It has been so left, and has resulted in such high rents and consequent overcrowding as to call for an immediate change, not in the interest of the workers only, but for the advantage of the whole town. It will be seen, from the summary sent herewith, that other towns are taking action in this direction. It has been urged that if the town owned houses of this character, the rents would be difficult to collect. The experience of Liverpool and Birmingham show that this is not the case. The Liverpool Corporation surveyor, in a letter dated 1st February, 1893, says, "With regard to the point raised, that the rents would not be paid, I think the best answer is, that since Victoria Square has been opened—1885—and Invenal Buildings—1888—to the present time, the weekly rents collected amounted to £22,779 8s. 9d., while the bad debts amounted only to £67 3s. 0d. Of course," he adds, "this is, to my mind, simply a question of management, as no doubt if the tenants were not sharply looked after, bad debts would accrue."

The Manager of the Improvement department of the Corporation of Birmingham, writing January 21st, 1893, says:—"The Corporation are owners of a large number of artisans' dwellings, and we experience no difficulty in obtaining payment of the rents."

It is obvious that if buildings are erected by the town, they

can be let at a lower rent than if erected by private individuals, as the town are able to obtain money at three and a quarter per cent., whereas a private individual would expect much larger interest.

There appears no valid reason why the poorer inhabitants should not share the advantage of the good credit enjoyed by the town.

At the present time the rents are unduly high in proportion to the income of the artisan, and much higher than in many other towns where the average rate of wages is greater.

Not only could a smaller rent be charged, but a greater amount of comfort afforded in the town dwellings.

The statement that accompanies this letter of what other towns have done, shows that with judicious management artisans' dwellings will repay a fair interest on the outlay, and involve no extra burden on the ratepayer.

Beyond this, the diminution of sickness has a direct tendency to reduce the poor rates.

Apart from all questions of humanity and good feeling, and from the standpoint of self-interest only, it would be to the advantage of all classes that the town should at once provide improved dwellings for its workers, who so materially contribute to its prosperity.

The Civic Centre trust, therefore, you may see your way to assist them by obtaining as many signatures as possible to the enclosed memorial.

WHAT HAS BEEN DONE ELSEWHERE.

The Corporation has held for some twenty years a property known as St. Martin's Cottages.

Expenditure on these cottages was:—£17,929, which included cost of site.

The net average return on the capital for twenty years has been £3,179.

More recently they have erected artisans' dwellings in Victoria Square, at a cost of £68,000, the net return on which has been 3 per cent.

These dwellings consist of:—86 three-room tenements let at 5s. 6d. to 5s. per week, 164 two-room tenements let at 4s. 3d. to 3s. 6d. per week, 21 one-room tenements let at 2s. per week.

They have also erected:—Labourers' dwellings at a cost of £7,056. The weekly rents are 4s. to 3s. 9d. Net return, 4 per cent.

Speculative builders have built on land sold by the Corporation inferior four-room cottages charging 6s. 6d. a week, and thus obtaining a return of 10 per cent. on their outlay.

They have further erected several buildings containing 100 tenements and one shop; expenditure, £16,145. Net return on the average of the last two years, £3,126.

A higher return of interest would be shown if the Corporation charged the same rents as those paid to private owners.

The authorities have preferred to give the tenants the benefit of a low rent, and the rentals are 20 per cent. below those usually charged.

The moral effect produced by these improved dwellings (says the Corporation Surveyor) has been excellent, whilst the death rate, which in the crowded districts was 40 to 44 per 1,000, has, in the Corporation buildings, averaged about 21 per 1,000.

Glasgow.

The Corporation of Glasgow has spent £87,212 on seven lodging-houses, and £20,000 on model tenements. The model dwellings are of a superior class, and are chiefly occupied by artisans, and are never empty. The rent of a single room is £8 per year; of two rooms, £9 18s. per year; of three rooms, £13 per year, the tenant paying in addition rates and taxes. The cost of the seven lodging-houses has been £85,000. The net return from 1881 to 1890 has averaged £4 16s. 8d. per cent. on the capital invested.

The gross revenue for 1889-1890 was £10,886 16s. 2d.; expenditure, £6,248 4s. 11d.; net revenue, £4,638 11s. 3d.; equal to nearly 5½ per cent. on the cost.

Cardiff.

The Corporation have formally adopted Part 3 of the Artisans' Dwellings Act, and the whole matter is under consideration at the present time.

Halifax.

The Corporation has closed a large number of houses unfit for habitation, and have bought up and removed considerable areas of such property. They are now applying for powers to borrow and expend money in the erection of artisans' dwellings. The Mayor remarks: "Opinions differ very much as to the desirability of the Corporation doing this work. In this town the weight appears to be on the side of erecting buildings, and in all probability we shall do so."

Birmingham.

The Corporation, under their improvement scheme, acquired 1,867 houses; of these 886 were taken down, and the remainder repaired and put into a sanitary condition by removing buildings when too crowded, rebuilding out-offices, paving the yards, and providing a proper system of drainage and water supply. The Corporation has also built upwards of one hundred model artisans' dwellings, which are let at rents varying from 5s. to 6s. per week. Before the improvements in question the average death rate for three years 1873, 1874, 1875, in one area of the town, ranged from 40 to 97 per 1,000. For the whole town, from 1875 to 1879 the rate was 23·91 per 1,000, but 1880 to 1884, 20·83, and 1885 to 1889, 19·19.

Newcastle-upon-Tyne.

The Corporation have decided to build a lodging-house for 300 men, a lodging-house for 100 women, and a building to contain fifty single tenements.

THE PROPOSED MEMORIAL.

To the Corporation of Brighton.

The memorial of the undersigned ratepayers of the Borough of Brighton respectfully sheweth:—

1. That in the opinion of your memorialists it is desirable that immediate steps be taken to improve the dwellings of the artisans of this town.
2. That this can only be efficiently done by the town erecting and holding, as owners, not less than 300 dwellings, to be erected from time to time as suitable sites can be obtained.
3. That the experience of other large towns has shown that this can be done without increasing the rates, and that the rents of such houses are punctually paid, and yield a fair return to the town.
4. That experience has also shown that in Brighton, as well as in other large towns, private enterprise has generally failed to provide wholesome dwellings at moderate rents. That the high rent of artisans' dwellings in Brighton produces overcrowding, and that such overcrowding frequently results in disease and death.
6. That the prosperity of Brighton largely depends on its character as a health resort, and that, in the interest of all classes, it is desirable that a low death rate should prevail.
7. That the report of the Brighton Medical Officer of Health conclusively proves that if better dwellings were provided for the artisan class the death rate could be considerably decreased for the whole town.

Your memorialists therefore pray that you will instruct your officials to make inquiries for suitable sites for artisans' dwellings, to obtain all legal powers, and that you will, at the earliest possible period, take all needful steps to provide and hold as landlords wholesome dwellings at moderate rents for the artisan class of this town.

NAME.	ADDRESS.	OCCUPATION.
-------	----------	-------------

AN APPEAL FOR LITERARY LUMBER.

I VENTURE to make a special appeal to my friends to overhaul their bookshelves and their cupboards to see whether they could not spare with advantage to themselves some portion of their accumulated mass of literary lumber. When at the beginning of the year the "Free Literature Society" was established for the purpose of supplying the inmates of our workhouses and public institutions with a regular monthly supply of reading matter, we succeeded in obtaining contributions from various publishers who were good enough to place every month a certain number of their returns at the disposal of the society; but as we have to supply parcels to nearly two hundred workhouses in various parts of the country, and as you cannot send many duplicates to the same institution, we stand in need of fresh supplies of magazines and illustrated newspapers. The Free Literature Society at Bouverie House, Salisbury Square, will send to any part of London to collect any store of literary lumber of which the owner may wish to dispose. I especially press this subject upon those persons who are about to travel or to leave the country for a term of years. Persons who are giving up housekeeping, or who are ridding themselves of any unnecessary impedimenta, cannot do better than send a postcard to the Free Literature Society, or if they forget that address, to me at this office, and we will undertake to have their surplus books and magazines and illustrated miscellanies carted down to the distributing centre, and re-made up into parcels for the workhouses in our list. It is only a question of giving an order, or of spending a little time to put together printed matter, which but for some such agency as this would never be looked at by human eye.

OUR LANTERN DEPARTMENT.

FOR some time past I have been much troubled in my mind as to the difficulty of carrying out the ideal upon which the National Lantern Society was originally invented. That society continues to perform a certain function, but in the opinion of the present secretary it does not supply the basis upon which we could hope to realise the larger scheme that first led me to take the subject up. What people want—especially those who are just beginning lantern work—is to be able to lay their hands upon the slides and lectures which they require. So long as these slides are provided by the ordinary channels of trade, there is no necessity for troubling ourselves in the matter. But everyone who has ever undertaken to conduct a series of lantern services will testify with me as to the difficulty of obtaining suitable slides for the purpose. I have therefore decided to set on foot the production of a series of Sunday evening lectures with suitable slides, which will be available for the coming winter. Further particulars will be announced next month; meantime it is sufficient to say that the office of the Lantern Department of the REVIEW OF REVIEWS is established at 18, Pall Mall East, where Mr. Eaton, late of Liverpool, will be very glad to see any reader of the REVIEW who may wish for information on the subject, or to have hints as to the best method of conducting lantern services. The series of lectures will be so arranged as to be available for the regular Sunday services; they will deal largely with questions of social Christianity; they will also include themes of general interest, handled by leading representatives of various branches of the Christian Church.

THE WASTED WEALTH OF KING DEMOS.

THE REVIVAL OF THE PILGRIMAGE.

NEW proposals ever submitted to the public have been received with such unanimous acclaim as the suggestion that the pilgrimage should be revived and brought up to date as a means of reviving popular interest in the historical associations which cluster so thickly around the southern coast of our island. The press has enthusiastically hailed the scheme as one deserving of all support, while many correspondents have written urging that similar pilgrimages should be organised on a smaller scale and in other localities.

LINCOLN AS A PILGRIM CENTRE.

Here, for instance, is a letter from Precentor Venables:—
“May I be permitted to say that the idea you have broached has my hearty sympathy. It has long been a grief to me that our people generally know so little of, and therefore care so little for, the grand past of their country, and that individualism seems taking the place of patriotism among us. Your idea of rendering history more living by visits to historic cities appears to me an excellent one, and I hope I may live to see it carried into effect.

Should this be so, may I suggest that Lincoln would be an admirable centre for such a pilgrimage, or series of pilgrimages? The city itself, with its glorious cathedral and historic memories linking England of the present day with the darkest ages of our country's history, would be full of instruction, while from it might be made excursions to Gainsborough, where Alfred was married, and Sweyn died. Sleaford, Newark, the scene of John's last days. Southwell, with its Cathedral and memories of Charles I.'s last night as a free man. Worlthorpe, the birthplace of Sir Isaac Newton. Epworth, the birthplace of John Wesley. Bosworth, the cradle of New England Puritanism; the Tennyson land, and many other places too numerous to mention, that would make receptive minds all the richer and teach them lessons of value. Of course to render such visits profitable there must be precedent preparation and accompanying descriptions by duly qualified persons. Each pilgrimage should have its own handbook, which I think ought to contain passages from well-known historic writers, such as Macaulay, Carlyle, Freeman, Frode, etc., etc., descriptive of the events illustrating the places visited, and care must be taken to have really good exponents on the spot, otherwise the whole thing might degenerate into a mere picnic excursion. May I say that should Lincoln be made the centre of the pilgrimage, I shall have the greatest pleasure in doing what I can to make it successful?

OR, BETTER STILL, OXFORD.

Another, and even more practical, correspondent writes to me from Southport as follows:—

May I suggest a cheaper alternative pilgrimage? Take £7 as a sum within the reach of an average man. Oxford to London, about 5s. Meet, say, at Oxford three days.

First Day.—Address on Early Oxford, by Parker; visit St. Martin's (Saxon); St. Alban's Hall (a specimen of institution older than colleges); oldest buildings (in Merton); Port Meadow Castle.

Second Day.—Mediæval Oxford. Address: “The Friars in Oxford,” by editor of that volume in Oxford Historical Society, or the beginnings of a University; visit New College, as perfect specimen of mediæval college. Friars Garden, Magdalen. Address—“The Great Strike of 1381, and Oxford's Share in It.”

Third Day.—The Civil War in Oxford. Address by Gardiner; visit Merton, Royal lodgings, new Town Hall, the then Mint, Bodleian for Parliament sitting; excursion to Edgehill or to Milton's cottage; Oxford to Worcester about 4s.

Fourth Day.—Worcester and Tewkesbury. Cromwell and Charles II. at Worcester; John Halifax's country. Address:

“Wars of Roses”; visit battlefield, abbey and memorials, Abel Fletcher's house; paper in garden of same on “John Halifax.”

Fifth Day.—To Warwick, fare about 3s. See castle of Kingmaker, Leicester hospital, Beauchamp chapel, scene of execution of Gaveston. Address: “Edward II.”

Sixth Day.—To Stratford, fare 1s. Address: The inevitable William, of course.

Seventh Day.—Coventry, fare 2s.; George Eliot's country. Address: City Life Six Hundred Years Ago. Visit Guildhall, St. Mary's Churches, hospitals, etc., Combe Hall.

Eighth Day.—Kenilworth, fare 6d. Address on Scientific Growth of a Castle.

Ninth Day.—Drive to Rugby, if possible, say 2s. 6d. “Tom Brown's School-days.” Visit Naseby field.

Tenth Day.—Say put in at Worcester between 3 and 4. Ten days' lodging and food at 10s., £5; fares for fifty or more, almost certainly less than 30s.; tips, say 10s.

This, of course, is very rough; done in my office without books to guide me; but I feel sure that something of this sort could be done at much less cost than I have named; 10s. a day each for board, etc., is needlessly high if the pilgrims will consent to live simply.

OR COLCHESTER.

The Mayor of Colchester suggests that the Eastern Counties are as well worth a visit as the South, while various correspondents suggest historic pilgrimages in Scotland and Ireland. The Scotch last month have been celebrating the anniversary of the battle of Bannockburn on the battlefield, and their example may be followed with advantage elsewhere. The Mayor writes:—

If you should choose to include Colchester in your pilgrimage, I should be only too delighted to entertain your party, and to provide them with a well-qualified guide to this ancient town. Colchester, as you may be aware, is the great repository of Roman-British remains. We have more treasure of this kind than any other part of the country. Two fine museums, a grand Norman castle, a large and architecturally unique Norman Priory, a Saxon Church, a mediæval abbey gate, and about a dozen ancient churches are among the many objects of interest within the old Roman walls of Colchester. Within a few miles is the beautiful village of Dedham (Constable's Country) various castles, and by the sea (at Walton-on-Naze) the finest piece of “Red Crag” in the kingdom. Our oyster fisheries might also be worth seeing. This is the first Capital of England, and you would do well, I think, to introduce it to your Pilgrims.

Of the projected pilgrimage round the South Coast to Bristol, I have only to repeat what I said last month—that if two hundred persons are willing to pay twenty guineas each for the trip, I will undertake to organise it. But at present I have not received two hundred applications for berths on board the *Mayflower*, and unless I do, the realisation of the proposal will have to stand over, and I shall return the deposits paid for berths already booked.

Whether the great pilgrimage does or does not take place next year, I sincerely trust that all those engaged in teaching will avail themselves of every opportunity to take their pupils to scenes of historic interest in their own locality.

This winter might be profitably utilised by drawing up schemes of cheap popular pilgrimages in the various counties of our land. I invite suggestions from my readers, and I shall be glad if our amateur photographers would be so good as to send me specimens of their art illustrative of the relics of our national past in their own locality.

THE PATROLS OF KING DEMOS.

MORE LETTERS FROM CHIEF CONSTABLES.

THIS month I publish a fresh batch of letters from the Chief Constables of large towns on the subject of the utilisation of the police force for other than punitive operations. These letters, taken together with the communications published in the two previous numbers of the REVIEW, are very significant, and I respectfully commend them to the attention of Mr. Asquith and Mr. Fowler, as well as to their predecessors, Mr. Matthews and Mr. Ritchie. They show that, if the police are not "spoiling for something to do," they are by no means averse to accept new duties, and are even disposed to welcome the recognition by the State and the local authorities of their importance as agents for superintending the distribution of charitable relief. This is a sign of the times well worthy of being studied by all observers of social and administrative evolution. It will be very interesting to see what Mr. Herbert Spencer and his school have to say of this new and significant development of government by police. The example of Edinburgh is being followed elsewhere. I read the following paragraph in the *Westminster Gazette* :—

The Editor of the REVIEW of REVIEWS will be delighted to hear that the Glasgow police, acting in conjunction with the Charity Organisation Society, are about to carry out a scheme for clothing all the destitute children of the city free. A register of the city arabs is being made by the policemen on each beat, and cast-off clothing is to be collected, re-made under the superintendence of the Charity Organisation Society, and distributed to the children. Every article of clothing will be stamped, and pawnbrokers will not be permitted to take it in pledge. Similar steps are being taken at Cardiff.

Without further preface I print the letters from the Chief Constables.

ASHTON-UNDER-LYNE. J. SNELL.

I have read the article with much pleasure, and I think the Edinburgh scheme a good one; but I do not agree with Capt. Henderson in some of his remarks. Should a similar association as that in existence in Edinburgh be started in this borough, I am sure the police will with pleasure render every assistance.

BLACKPOOL. J. C. DERHAM.

I am of opinion that the police in many places could, without in any way interfering with their ordinary duties, help any society whose object is to find out and relieve destitute or neglected children in the manner now done in Edinburgh. In the winter of 1890 there was a considerable amount of distress amongst the outdoor workers living in this police district; soup-kitchens were organised by a committee of ladies and gentlemen, and the aid of the police was sought. I instructed the police while working their beats to find out and report upon all cases where need of help was apparent; these were inquired into by the superior officers of the force, and their reports summarised and forwarded to the Soup Kitchen Committee; tickets for soup, bread, tea, bacon, coal, clothing, etc., were sent to me for distribution, and all applicants for help came to the police-station, when their cases were inquired into and reported upon by the constable on the beat. This system worked to the perfect satisfaction of the committee, and certainly prevented the money, etc., of the charitable being expended upon many persons who were not in need of it. A little extra work was thrown upon the police, but it was done most willingly, and would be again if required; but I am happy to say that at present there is no need of this or any organisation to deal with the class of children referred to in your articles. I might also add that the good feeling engendered at that time between the police

and the poorer class of population here is still evident, and I have no doubt has appreciably tended to a reduction of offences and the preservation of better order. I am also of opinion if the services of the police in large towns and cities could be obtained by the charity organisations, their funds would be expended with greater economy and to better purpose. The police also would gain, inasmuch as they would obtain a better knowledge of many who are, through want, often tempted to commit crime; thus the police by bringing timely aid would prevent crime.

BIRMINGHAM. T. FARNDALE.

In reply to your letter of the 12th inst.—Upon my return from a short holiday, Mr. W. J. Clarke, a local gentleman from the Hurst Street Domestic Mission and People's Hall, had an interview with my superintendents and self in reference to the subject, "The Wasted Wealth of King Demos." As he was the representative of a local committee, we discussed the subject-matter with him in its entirety, and expressed our complete sympathy with the principle of the scheme, and

CHIEF CONSTABLE FARNDALE.

promised that we would render the local society all the assistance we possibly could towards carrying out its object successfully, but not to the extent sketched out by Mr. Henderson. I do not think that I can add anything further in way of observations to those you have already received. What is true as regards the necessity of such a scheme, notwithstanding the various charitable institutions we have already in this city, cannot be gainsaid; but there may arise a conflict of opinion as to whether the said committee or the police should be the executive. Here, evidently, through the publicity you have given to the scheme in the REVIEW of REVIEWS, that difficulty had been cleared away, as you have evoked the enthusiasm of local gentlemen to form a kindred society which can vie with the other charitable organisations in looking after the neglected poor in this city, and which you may rest assured will receive our cordial support and assistance.

BRISTOL. EDWIN COATHUPE.

Mr. Henderson's scheme for looking after and providing for destitute children is one in which I think we must all take an interest, and I am sure that the police authority of this city will offer no objections whatever to the police being employed in such a good work.

CARLISLE. GEORGE MACKAY.

About five years ago a number of benevolent ladies and gentlemen in this city formed a "Children's Aid Society," for the purpose of providing poor and neglected children with free dinners and clothing during the winter months. Last winter they supplied 29,404 dinners, a daily average of 450, at a cost of £99 9s. 9d., and, in addition to this, poor children were supplied with such cast-off garments and new shirts as were at the disposal of the ladies' committee, the members of which visited many of the homes of the children, and were thus enabled to find out where distress was most pressing, and distribute such articles of clothing as were most required. In this work they were ably assisted by the teachers in the

various schools and by the school attendance officers. This society has done much good. Beside the "Children's Aid Society," the school attendance officers have what is known as a "Clog Fund," formed from contributions of clothing and money supplied by the citizens. Last winter 500 pairs of clogs were given to poor children and many articles of clothing. There is now an energetic inspector from the National Society for the Prevention of Cruelty to Children stationed here who is doing some good work. The police of this city assist all who are engaged in any way for the benefit of poor or neglected children, by giving such information as comes under their observation calculated to forward such work. Last year I suggested that all articles of clothing issued to the children should be marked in such a manner as to prevent these articles being pawned or otherwise disposed of. It is very gratifying to learn that Captain Henderson, Chief Constable of Edinburgh, has so thoroughly taken up the cause of destitute children in that city, and has so perfected the scheme which has been in operation in several towns, in various forms, for years. The members of the police force of this city, however, are not "spoiling for something to do," but are always willing to give assistance in any scheme having for its object the alleviation of suffering children, but the work has been so well carried out here in the past that I consider it could not possibly be in better hands than it is now.

GATESHEAD. JAMES TROTTER.

I agree with a great deal of what has been put forward by Captain Henderson. However, this being practically a working class borough, it is consequently a very poor borough, with a very large number of very poor, ill-clad and ill-cared for children, and I am afraid would compare very badly with a wealthy city like Edinburgh. I may say that I have now been upwards of twenty-two years a member of this force, and during these years several temporary movements, supported by the police, have been set on foot during severe winters, when trade was bad, with a view of relieving those in distress by feeding and clothing their children; and although I believe, like Captain Henderson, that the police machinery is the safest and best machinery which can be employed in work of this kind, and by which deserving cases can be reached, I must admit that my own personal experience of this work is not of a flattering nature. Nevertheless, I would heartily approve of any scheme which would assist in elevating from their present distressed condition the large number of ragged children who can be too easily seen in the streets of this borough and who are practically foreigners to the comforts of this life. With that object in view, I shall see that your article is brought under the notice of some of our philanthropic ladies and gentlemen. What can be done by the police in Edinburgh can be done by the police of this and every other town, if their numbers are in proportion to the duties required of them; but the old saying that "if a person has too many irons in the fire he is sure to burn some of them," can be as practically applied to the police, in the discharge of their duties, as to any other calling that I know of. I have no doubt that the more the police are brought into civil contact with the public in charitable work of this kind, the more will the public realise the value of the police, and the more efficient will the police become in the discharge of their very numerous and difficult duties.

GREAT YARMOUTH. W. BROGDEN.

I have read with interest not only Mr. Henderson's scheme, but the letters from the different chief constables. I may state that in this town we have had for years homes for friendless girls and boys, such homes having every assistance from myself and the men under me, and we have both ladies and gentlemen, who, every winter appeal to the public for boots and clothing for the poor children, and I must say their appeals are not in vain. We have also an officer belonging to the R. S. P. C. C. stationed here, and both the officer and his wife are doing a large amount of good. I have also eighty boys, from ten to fourteen years of age, as market porters, and we have under consideration a scheme for licensing shoeblacks, so I think you will agree with me the youngsters of both sexes

are pretty well looked after. I have shown your REVIEW to one of the lady workers, and she is of the same opinion as myself, that great credit is due to Mr. Henderson for the good work he is carrying out.

HANLEY. H. WINDLE.

I do not think the surroundings of the Potteries are at all to be compared with Edinburgh. We have in Hanley alone, with a population of 55,000, something like forty churches and chapels. We have also three armies, or missions, viz., the Salvation Army, the Salvation Mission, and the Christian Mission, the two latter being offshoots of the former. The leaders of these missions, together with the police-court missionary, and the officer of the Charity Organisation Society, devote their whole time to the amelioration of the condition of the working classes. Great credit is due to Mr. Henderson and his lady for the good work they have embarked in, and I trust that still further success will attend their efforts; but I do not think the time has yet arrived when the police can be used with such advantage in this district.

LEEDS. F. T. WEIB.

I shall be very brief, because in reviewing the opinions expressed by the different chiefs of police of cities and boroughs, I select and follow those of Capt. Bower of Liverpool, and Chief Constable Wood of Manchester. So far as Capt. Henderson's idea goes, it is highly commendable; but the opinion of his men as to there being too little to do will certainly not bear out here. Leeds, with its population of nearly 400,000 resident persons, certainly occupies the whole of the attention of the police with their actual duties, which are not, as Mr. Wood states, simply catching thieves and attending police and other courts. I undertake to say that when men have beats to work such as in this city, they have quite sufficient to do to occupy their attention, if they do their work properly, without taking the initiative in such a matter as Mr. Henderson suggests, although they might assist a society such as you describe. If I take the matter home to myself, I would say, that in the borough I left to take up office in this city, I inaugurated a soup-kitchen for "waifs" and "strays," and fed, through the winter, two or three hundred children, two, three, or four days a week, according to the severity of the weather, and I met with every possible support from the public, and it was the greatest pleasure of my life to witness these poor, half-starved, and almost nude children enjoying their basin of soup and a piece of bread. This led up to clogs and different things being given out; so that whilst warming the inner body, the outer was kept warm; but I regret much to say the parents of many of such children disposed of the clogs, etc., given to the children. As to the clothing, unfortunately in the majority of instances, so far as my experience serves, you may issue to this class good clothing, and it is allowed to go to shreds, without the slightest attempt on the part of the mother (so-called) to put a stitch in. Regarding "shoeblacks" and "Industrial brigades," there, again, I am sorry to say, lads have been started with complete equipments, but have given it up in a very short time, in order to take to selling matches, etc., which must either be more profitable, or easier work. In conclusion, allow me to say that my seventeen years' police experience has taught me that the members of the force are most kind to children, whether "lost" ones taken to the police-station, or "waifs" and "strays" in the street; for any person must know that if men on duty were to lock-up, or summon all children for breaches of the law, where we have ten cases now, we should have tens of hundreds. Again, let me add, should such a society be formed in this city, the men of the Leeds City Police Force will not shirk a little extra work in the cause of humanity.

NOTTINGHAM. PHILIP CLAY.

The Edinburgh scheme is good, and undoubtedly the best that has come under my notice for the purpose of "dealing with the shivering children of the street," and I am quite of your opinion "that the Chief Constable corresponds more nearly to the ideal of a secular bishop than any of the functionaries in the Modern City." It must of necessity be so. For "the chief" is in reality a father-confessor and

general adviser to the great mass of poor persons of both sexes, who, unable to pay for legal advice, seek his assistance daily on matters ranging from broken windows to broken heads, from broken vows to broken hearts, and so on over the whole sad circumstances that go to make up human life under certain conditions. However, to the point. I am afraid it would be impossible to obtain a census of *all* the neglected children in our streets. But the great majority could, I have no doubt, be got hold of. I should say that if such a scheme were started here, the police would be able to (1) make inquiries into the cases; (2) secure the co-operation of pawnbrokers and second-hand clothes dealers (perhaps the most vital point in the whole scheme); and (3) to a certain extent keep observation on the children clothed. As security that the children's clothes shall not be sold for drink, Mr. Henderson says that it is the duty of the constable who reports deserving cases on his beat to see that the children wear the clothes, and if they appear without them he is to inquire and report. This plan may be workable in Edinburgh, but here, where constables change their beats every fortnight, some other plan of supervision would have to be devised. I am afraid I must disagree with Mr. Henderson when he states that the police "are spoiling for something to do." I can assure you such is not the case. If a constable perform the many things required of him *properly*, he is much more likely to wear out both mentally and physically than to rust out. Having served a term of seven years as constable, I can also claim to speak with some little authority on this point. Although I cannot forget that we are necessarily policemen first and philanthropists afterward, I consider, speaking personally, that it would be putting my experience to very poor uses and be failing in my duty to the neglected little ones if I did not support such a scheme as this if it were started within my jurisdiction, and feeling quite sure of obtaining the willing consent of my Local Authority to do so. While dealing with this matter, I may say that I have under my care a Bootblack Brigade of a dozen lads, who are supplied with a suitable uniform, for which they pay ninepence per week. They start about eight a.m. in the summer, rather later in winter, and finish about noon. Their average earnings are about seven shillings per week. As they grow up they are helped to better situations, their places being filled by other lads, who would otherwise be loitering about the street corners. A police inspector continually looks after them, and once a year they are formally inspected by the Chief Constable, who afterwards entertains them to a "high tea" and a little good advice. The boys become quite attached to their posts, and salute the principal police officials with the exactitude of veterans. This little brigade has been in existence for some years, and is handed over as a legacy from one Chief Constable to another. While I was Chief Constable of Southampton I had the pleasure of inaugurating, in conjunction with every member of my force, an annual meat tea and musical evening to poor and needy old people, both men and women, who usually numbered about a hundred. For some weeks before the event sergeants and constables made private and careful inquiries into the condition of the old and poor persons living in their districts, and sent a report to headquarters, when the most deserving were selected. On many occasions it was found that they never had fresh meat but on Sunday, and then often of the poorest quality and very little of it. I think it right to add that "The Cruelty to Children Act" is very actively enforced by the police in Nottingham, the Watch Committee and the Town Clerk taking a very earnest interest in its provisions.

OLDHAM. R. PEACOCK.

I see nothing to prevent such a noble work being carried out in other large towns, providing the necessary funds were forthcoming. Personally I should render all the assistance that lay in my power, and I feel certain that the police under my command would do the same, although I cannot agree with the remark that the police "are spoiling for something to do"; it is quite the reverse in most Lancashire towns. I quite agree with Mr. Henderson that the better the relationship between the police and public the more efficient the police will become. A number of new duties have been added to the police during the last twenty years, but I am sure this is one they would

accept and carry out with the utmost pleasure. I have always had the greatest sympathy with poor children, and am at present a member of the Executive Committee for the Prevention of Cruelty to Children, which society has done and is doing a grand work in Oldham for the many suffering and helpless children; and the police here work in perfect harmony with that society, although their labours are

CHIEF CONSTABLE PEACOCK.

somewhat impeded in consequence of not having a home where the rescued children can be removed. I should like to see permanent homes established in every large town, where neglected children could be properly cared for without having to be taken to the workhouse. There are several agencies at work for assisting the poor in this town, but I feel certain one on the lines suggested in your number would not be subject to the same abuses. I should also like to see homes in different centres for the rescue of fallen girls, and I think the Social Purity Association might extend their labours in this direction, for I have tried several times during the last twelve months to get a home for girls who were desirous of leading better lives, but have failed; the consequence has been that the justices have had no alternative but to send them to prison or allow them to go amongst their old companions. When I was Chief Constable of Canterbury there was no difficulty in getting homes for such girls, for there were ladies who undertook to receive them into a home fitted up for that purpose, where a matron was engaged, and after remaining there a short time they were removed to a larger home and afterwards sent out to service, and I have known some remarkable cases where girls have been reclaimed in this way. The amount of quiet and truly Christian work Mrs. Scott Huxley and Mrs. Payne Smith have done for fallen girls (never mentioning the expense) is known to very few persons besides those concerned, and I have often thought they would receive their reward in that well known passage of Scripture where it says "by their works ye shall know them."

PERTH. J. WELSH.

One cannot but sympathise with any and every attempt to relieve distress, whether it take the form of feeding the hungry or clothing the almost naked, more particularly when those who are fed and clothed are suffering from no fault of their own. Every town, according to its population, has its number of ill-fed and sparsely clothed children, and it is the greater pity that the largest number of these children need neither be hungry nor in want of clothing. It is well known to the police of every grade in all populous places that nine-tenths of all the wretchedness and misery they see and come in contact with is actually caused by intemperance, and cases of ill-fed and poorly clothed children are rare when such is not the case. In August, 1889, an Act was passed "For the Prevention of Cruelty to and Better Protection of Children;" but the cases brought before the courts, as far as I have observed or had to do with, all showed a continuance of ill-treatment of the children for weeks and often for months. By the Borough Police (Scotland) Act, 1892, which came into force on the 15th instant, a person found drunk in the street and incapable of taking care of himself, and not under the care of some suitable person, may be fined in the sum of 40s., or be sent to prison for a period of thirty days if the fine be not paid. Since it is a police offence to get helplessly drunk, and be in any street in that condition, and entailing as it now does a heavy penalty or a long imprisonment, surely it is a much more serious offence for any one to keep his children

hungry and cold and almost naked, while the money spent for drink would be sufficient to feed and clothe all less or more decently and comfortably. If it was made a police offence for a man or a woman to spend their money in drink and leave their children destitute of food and clothing even for a very limited time, one could for see, not far in the distance, a time when ill-fed and ragged children would be scarce upon our streets; but till the root of the evil is attacked I cannot but look on all such movements as Mr. Henderson is engaged in, which no doubt are laudable under present circumstances, as merely temporary relief. I cannot at present give an opinion as to the employment of the police in the manner Mr. Henderson is doing. It is a new experiment, and after a time, if it is a success, I have no doubt but the police authorities everywhere would be glad to follow his example, as far as they have opportunity.

WALSALL. C. TAYLOR.

I have delayed answering, as I wished to give the matter very careful consideration before writing you, and I have come to the conclusion that much good might be done if the matter were taken up by the police of the country generally. The class of people in a town like Walsall, who would need to be assisted, are migratory in their habits, and unless a system could be devised in the black country towns to follow those who were recipients of the clothing, etc., I am afraid there would be a deal of imposition. The opinion of Mr. Henderson, that it is the duty of the police to assist in any movement of the kind, I unhesitatingly agree with. I have always looked upon the police force as possessing within its ranks, men who are specially qualified to deal with the class of persons who require attention when they have been the recipients of charity, whatever form that charity might take. There is, however, in my opinion, one objection to the scheme, viz., that a number of dissolute and improvident parents would hail with delight any society or organisation that would relieve them of the responsibility of clothing their children, because it would mean so much additional money for them to spend in drink and debauchery, and my experience in a large town in the north of England (with which I know you are well acquainted) proves to my mind beyond doubt that amongst a certain class of people who have been the recipients of charity, during times of exceptional distress, there is always a tendency to let things run on in as easy a manner as is consistent with their obtaining food to eat, and money to spend in drink. I shall be pleased to co-operate with any society, or number of persons that might be induced to take up this very important matter; although in Walsall there is not that amount of acute distress such as you will find in large towns like Liverpool, Manchester, Edinburgh, etc. It is very gratifying to chief constables, who have been in the service for any number of years, to find how much closer is the bond of citizenship between the police and inhabitants than was the case in years gone by, and this, I think, is due to the fact that the public generally, and more especially the poorer class have for some time recognised the fact that the police are their protectors, and not their persecutors. I am certain that in speaking for myself I am only expressing the opinion of other chief constables, that anything that will reduce the number of offences which we are compelled to report annually, will reflect greater credit upon the police service than any smart capture or acts of zeal on the part of any particular department of the service. I am not a literary man, and have expressed my opinions somewhat crudely, but I think you will be able to gather from these few remarks that you would have the assistance of myself and the men under my command in any crusade or movement that might be undertaken for the benefit of our fellow workers.

WOCESTER. T. W. BYRNE.

I consider the scheme an admirable one. The police have undoubtedly better facilities than any other existing body for knowing of and reporting cases of children in need of clothing, and also keeping them under supervision after clothing has been supplied. They also have another advantage in being in constant touch with pawnbrokers and second-hand clothes dealers, to whom clothing may be offered for pledge or sale. They would, therefore, be a splendid auxiliary to any society formed to carry on such a work as described in your article.

While the police may—and no doubt in many instances with very good reason do—feel that they have at present plenty to do, I venture to say that they will be prepared to perform with pleasure the extra duties which would be entailed upon them in carrying out a scheme like the Edinburgh one, dealing as it does with the “helpless” section of the destitute. I fully concur in the opinion of Captain Henderson, that help of this kind would improve the police themselves, and tend to establish friendly relations between the police and the public—a result which would be of great assistance to the police in the performance of their manifold duties. There are several societies in this city having for their object the relief of the destitute, but none dealing directly with the welfare of children, except a branch of that excellent Society for the Prevention of Cruelty to Children. I see no reason why a scheme similar to the Edinburgh one could not, in a great measure, be carried out in the city. If a society were formed here for that purpose, it would have my hearty support.

By an error in making up, which I much regret, the portraits of the Chief Constables of Manchester and Preston were transposed in a portion of the May number, Major Little's portrait appearing over Mr. Malcolm Wood's name, and *vice versa*.

MR. WAUGH'S PROTEST.

In the *Child's Guardian*, Mr. Waugh raises a word of caution, to which I am very glad to call attention, although I cannot accept Mr. Waugh's somewhat characteristic, exaggerated statement that he cannot conceive a more pernicious undertaking, or one more calculated to aggravate the evils in which the destitution of children has its origin, than giving boots, clothing, and food to them. Mr. Waugh says:—

That charity of this kind creates destitution is beyond doubt. If the man who spends all his wage on himself can get his children rigged out by other people, that man's neighbour is seduced into spending all his wages on himself. If the idle have their children provided for, why should the prone-to-be-idle work? With very few exceptions, clothes providing for the destitute child is not a cure for the evil, it is an aggravation of it. The cure is to provide treadmills for those who make it destitute. In either way the naked are clothed; but in the latter they are clothed under conditions which are consistent with parental duty and self-respect and with national policy.

Mr. Waugh is the most benevolent enthusiast for the beneficent treadmill that ever trod shoe-leather, and every one must heartily approve of his zeal in the good cause; but while serving out his treadmill prescription galore, it can hardly be such a bad thing to take the best possible security that charity is not abused—that is the gist of the Edinburgh Scheme, which distinguishes it from other schemes. It will be a bad thing to feed the hungry, clothe the naked, but it is a less bad thing to do so under the supervision of authorities who are able to minimise the evils which fly from charitable relief.

Mr. Waugh has a particular bone to pick with Captain Henderson, inasmuch as he says the Edinburgh police do not enforce his Children's Charter:—

We are not surprised that Captain Henderson finds so much to do in Edinburgh, for, sitting upon the Bench with an Edinburgh magistrate some time ago, we discovered that some of the provisions of the Children's Charter were a dead letter in Edinburgh.

The London police put the law in motion, and, says Mr. Waugh, with this result:—

That a city, once a scandal to Europe for the numbers of miserable children visible in its streets, especially in periods of cold and rain, is now a city of which its inhabitants may, at least in this respect, begin to be proud. All the graver child-sufferings have disappeared from it; their parents have fed and clothed them, and by the new parental sentiment the rest are going.

THE CHILDREN'S COUNTRY HOLIDAY.

A FORTNIGHT'S FRESH AIR FOR TEN SHILLINGS.

At Walworth it is the rule not to take more than three children from one family to the country.

JANE'S STORY.

W E did it by pence in our family. When the Committee of the Children's Country Holidays Fund told mother that three of us might go into the county ef she paid two and sixpence for each on us—then she chose us by pence.

There were ten on us at 'ome, so you see she 'ad to make some sort of choice, and that wor the way we liked best. It seemed fair enough. Heads went to the country, and tails stayed at 'ome. Ef there were too many 'eads, we tossed agen. I wor always tails, always, until larst year, and then I come up 'eads.

I wor glad, I can tell yer. I'm Jane—I'll soon be gone fourteen, and I ha' never been in the country. We live in Walworth, and there ain't much country 'bout that 'ere part. There ain't no flowers to speak on, and no trees worth looking at. The year before, three on us went to a place where there wor trees as big as 'ouses and flowers so as you could pick 'em up like dirt, and sheep, and 'orses, and donkeys and cows, and—but there, I can't tell yer the 'arf.

You see, too, I worn't there, so I can only tell wot t'others told to me.

Well, larst year I come up 'eads.

They were all s'prised when I did, for I'm called unlucky Jane at 'ome.

Mother said—

"Yer luck's a turnin', my gal, only I'll say one thing—I wish as it 'ad been Bess."

I thought that bitter 'ard of mother, for Bess 'ad been to the country, and knew hall about the trees and flowers hand heverythink, and I 'ad never been—never in the 'ole course o' my life.

They don't take yer when you're gone fourteen, so you see this wor, so to speak, my werry larst chance.

I run out of the 'ouse when mother said, "I wish it 'ad been Bess," and went orf to tell a pal o' mine as I 'ad turned up lucky Jane and wor gwine to the country in a fortnight's time.

My word! I danced and skipped as I went down the street, and I hollered like anythink when I seed my pal a-comin' to meet me. 'E sells matches, and 'e 'adn't been in any luck, but I give 'im a 'apenny instead of playing pitch and toss with it, for I wor so glad, you mind, that I felt quite good-like.

I ain't good most times, and I don't know as I want to be. I like larks, and I don't see 'ow poor folks like us can be too partic'ler. Ef it weren't that I'd be nipped by one o' they p'licemen, I wouldn't see no 'arm in pick-pocketin' now and then. I go to school in course, and I larn my lessons right smart, but I never listen to lectures on goodness and that sort, and I wouldn't go inside a church, nor a meeting 'ouse, nor go near that Salvation Harmacy to save my life.

You see that's me—that's Jane. I ain't a good sort, but I wor so right-down glad to think as I'd 'ave my lark in the country, and get away from the 'ot street, and the 'ot hattie, and the ot, 'ot, 'ot bed where I lie o' nights with Bess at one side o' me and baby Joe at t'other, that I felt good-like, and I give the 'alpeny to my pal Dick.

Well, it wor all settled, and the Committee 'ad passed

me, and I wor s'pected by the Medical Hoffer, and a lady wot called herself a doctor pulled me about, and looked into my ears and at my teeth, and seed ef my 'air wor all right, and Mother set to washing up my bits o' duds. The label had come too to be sewed on me when I went to the country. Heverythink wor a getting ready, and I can tell yer I wor pleased at the fuss. Lor! it wor prime, and I felt 'appier and more larky day by day.

Course there's allers some drawback, and mother did fret me the way she 'arped about Bess.

Willie and Bob were the other-two in our fam'ly as 'ad tossed 'eads—Willie wor ten, and Bob eight and a 'arf.

They worn't to go with me at all, they were gwine to a place sixty mile North o' Lunnon; but I—Lucky Jane as I called myself then—I wor to go over a 'undred mile south o' Lunnon hall away, away, down to a place somewhere in 'Ampshire. A place nothink but trees as big as 'ouses, and grass greener nor you ever see, under yer feet, and flowers and birds heverywhere.

Bess 'ad gorn to that place the year afore, and she 'ad telled me all about it—so yer see I knew.

I wor glad, and ef mother 'ad asked me to go to meeting with her, why I'd ha' gorn, for I felt real down-right good.

Well, you'll say that I'm Lucky Jane—but wait till you 'ear.

Willie and Bob were to go orf to the country with a big party two days afore me.

Well, Mother she stowed up their duds inter a paste-board box, and tied it with string, and pasted their names on it, and then a big wan come and fetched 'em, and there wor a lot of other children in the wan, and they all went orf singin' and 'ollerin' like anythink, and I stood in the street and watched 'em, and I sang and 'ollered to.

It 'ud be my turn to go in two days, and I can tell yer I wor 'appy.

Bess come with me to see the boys start orf.

Bess wor the quietest child you ever see. Real purty you mind, with a thin, gentel kind o' face, and heyes that looked at you werry pleading. I don't know what their colour wor, but I allers said as Bess's eyes 'ud plead anythink out o' anybody.

"I'm so glad you're gwine to the country, Janey," she said.

"Right you air, Bess," said I. "It's my turn now, ain't it?"

"Yes, Janey, to be sure," said Bess, and then she went back to the 'ot hattie and sot on her little stool wid baby on her knee.

"Dear, dear, dear," said mother, as she wrung out one o' my duds with all her might and main. "I do wish as it wor Bess as wor gwine. She wants it, Bess do. She's that peaky, and I jest 'ates the sound o' 'er cough. It's 'ack, 'ack; not much to listen to, but jest the kind as cuts you in the 'eart, for you know what it means."

"It means nothing at all," I said quite hangry, for I knew that mother wor 'inting at me to give up my bit o' pleasure to Bess, and I didn't mean to do it.

Not I! I worn't sech a fool as that. I meant to go to the country and 'ave my fill o' larks. You see I didn't never 'ave luck, and it worn't to be 'spected as I'd give up my werry larst chance, for I couldn't go to the country at all next year, mind.

So when Mother began to grumble on, I jest clapped my 'ands to my ears and run downstairs and out into the street, for I worn't gwine to listen to any more o' that kind o' stuff.

"Let me come with you, Jane," sings out Bess.

Oh dear, oh dear, I didn't want her a bit. She's sech a peaky sort, you mind. I thought I'd 'av a lark with my pal Dick, and that maybe we'd go shares in some torf or other; but when Bess looked at me with her pleading sort o' eyes, I couldn't say no, though I wor right down cross, I can tell yer, at 'avin' 'er then, and I says, "Come along, kid, ef yer must," and I took 'er 'and, and we walked down the 'ot street.

Some'ow I worn't 'appy. The minit I 'eld Bess's 'ot little 'and, what wor thinner nor anythink you ever gripped 'old on, I felt pricks in my 'eart.

"Stay at 'ome, Jane," says a voice in my 'eart.

"Not I, you shut up!" cries I back at it, and I ground my teeth and set orf runnin'.

Bess ran too, and panted and puffed, and then I stopped, and we sot down on a doorstep and wiped our fore'eads.

The run made Bess cough, and there was my 'eart a-pricking at me again and saying again so ugly and loud—

"You stay at 'ome, Jane, and let Bess go to the country."

"Shut up," I says, and then I turns and begins to talk to Bess about the fun I'd be 'avin' in two days' time.

"Tell me what 'll 'appen when I gets there," I says.

"Oh, I know," says Bess. "There'll be a donkey cart. There wor when I went last year; a donkey cart, and an old 'ooman to drive it, and you'll set in the cart, and the donkey 'll go jest when he pleases, and he'll stop jest when he pleases. Ef he sees something green in the 'edge as 'e likes to nibble, why 'e'll nibble it, and you can't stop 'm, nor Mother Beech—that's the old 'ooman as keeps the donkey, and where we lodges—she can't stop 'im neither.

"Oh, I know all about that donkey," I said; "you ha' told me about that donkey and his misbehaving of hisself hover and hover and hover."

Bess stopped torking, and looked at me with her pleading eyes.

"I think I ha' told you heverythink hover and hover," she said; "but praps I didn't say what I liked best of hall the things in the country."

"Wot's that?" says I.

"To wake in the morning and feel cool," says Bess. "They'd leave the winder open, and the hair 'ud come in cool and soft, and there'd be the doves cooing. I liked that the best. I'd listen to 'em doves and shut my eyes, and think o' heaven. I'd do it every morning, all the time I wor in the country."

"What a little stupid you ere," says I, "as ef I'd bother myself listening to 'em doves! you wouldn't catch me lying awake."

"No," says Bess, looking at me with her pleading heyes and her little thin mouth a-quivering, "but ef you do wake some morning quite early, Jane, and ef you hear the doves, you'll think o' me, won't yer; you'll 'member that's wot I likes best when I'm in the country."

"Come 'ome now," says I, quite rough-like, for you won't believe me, but that pricking in my 'eart wor a-driving me mad.

"Let Bess go to the country," says the voice.

"SHUT UP, OR I'LL KILL YER," says I.

But the voice kep' talking, and the pain kep' pricking, for Bess did look that pale you could 'most see through her cheeks, and her eyes wor all shiny, and the blue veins come out on her fore'ead like the streaks on marble.

"Come 'ome," says I. "I can't be bothered 'avin' yer out with me no more; I told my pal Dick as I'd meet him this afternoon, and we'd 'ave a spree together."

"I can go 'ome by myself," says Bess, "ef you'd like to go to your pal now, Janey."

"All right," said I, "run along then, do."

I watched 'er a turning the corner; she wor a shrimp o' a little thing; she looked as ef a puff 'ud blow her clean out o' the world.

"Now what right 'ave a poor weak thing like that to come a worritin' me?" I mutters. "There's that voice again at me to let 'er go to the country, but you won't find me doin' that kind o' thing. No, no, *that's not Jane*. Jane ain't the good sort, and she's gwine to 'ave her own spree, I can tell yer."

I stayed out all day. I met Dick an we 'ad a bit o' fun together. I wor in a twitting sort o' mood, and I twitted Dick with 'avin' no luck, and me 'avin' it all, and Dick turned sulky at last and we 'ad a bit o' a quarrel. It wor dark night when I went 'ome.

Bess wor in bed and I 'eard that sickenin' little 'ack o' 'ers as I went up the stairs.

The minit I 'eard it that voice begun again.

"You let Bess go to the country, Jane."

"No," I says back at it, "and ef you tork any more like that at me, I'll strandlé yer—so there!"

Then I come inter the room where mother were ironing the last o' my duds.

My word! 'ow nice they looked. I never knew I wor so 'spectable afore.

"I'm going to wash yer 'air the werry fust thing in the morning, Jane," says mother.

"Hall right," says I; "but I think I'm going to bed now, for I'm real tired out."

"My sakes!" said mother, "wot tired yer? It ain't the 'elp you 'as been giving me. Look at the muck I'm in."

I might ha' offered to 'elp mother, ef I 'ad been good, but then you see I worn't. I wor the mean, selfish sort, and I lay down by Bess's side and went orf inter a jolly, deep sleep.

Well, well, when I woke it wor pitch dark. I 'eard mother and father snoring in their bed t'other side o' room, and there were Bess 'ackin' away. I thought Bess wor asleep. The minit I 'eard 'er, up starts the voice.

"That's a churchyard cough," says the voice, "and you'd better let 'er go to the country—you'll be real sorry ef yer don't."

"Shut up," says I.

"No, I won't," says the voice back again; "I won't never shut up till you listens to me. You may go to the country if yer like, but hall the time yer're there I'll be torking to yer about Bess and her cough, and you won't 'joy it a bit—no, not a bit. Bess may die from that cough, and then 'ow'll you feel? You tell me that—'ow'll you feel when Bess goes and dies and the worms is a heating of her up?"

You may believe me or not as yer like, but to 'ear that voice going on in the middle of the night, and Bess lying by my side 'ack 'acking, wor enough to turn a gal's brain.

"Dear, dear, dear," I said to the voice, "wot a fret and worrit you is! Well, s'pose I pertend ter oblige yer. It'll be only pretence, you mind, but jest to obleege yer—jest to see 'ow it feels."

"Bess; I say, Bess."

"Yes, Janey," says Bess at once.

"I thought you wor asleep," says I.

"No, but I thought you wor," says she back.

"Well now, Bess," I says; "s'pose you wor to go to the country."

"Oh, don't," says Bess with a little shiver.

"No; but s'pose you wor."

"But I'm not," she says, "and I ha' my eyes shut up tight so that I needn't see nothink."

"See what?" says I.

"The green grass," she said, "and the little donkey, and Mother Beech, and the little bedroom wid the winder wide open all night. I ha' my eyes shut tight so as a mayn't see 'em, and I ha' my ears shut so as I mayn't 'ear the doves a cooin'. Let's talk er somethink else, Jane."

"You're glad I'm goin', I s'pose?" says I—"you 'low as it's fair as I should go?"

"Oh yes, Janey, I 'low as it's werry fair."

"But you'd like ter go yerself, wouldn't yer now, Bess?"

Wid them words the pore little kid put her head under the bed-clothes and begun to sob werry faint and weak-like.

When I 'eard 'er sob I growled and gnashed my teeth, and tossed over to t'other side o' the bed.

Presently I 'eard Bess sleeping and breathin' reg'lar, but there wor no sleep fer me.

Well, you'll guess what 'appened. You'll know fer yerselves what 'ad ter come. You'll see now why I'm allers and allers Onlucky Jane.

I didn't say a word to mother nor to Bess, but I went orf to the ladies of the Committee, and I telled 'em somehow, I don't know 'ow, that I wished Bess to go 'stead o' me.

I dunnow whether they were s'prised or not—I don't 'spects they cared, and I don't mind a rap whether they cared or not. Hall I know is, they give in, and they give me a label to take 'ome to Mother to put on Bess's things 'stead o' mine.

I didn't much care—hall my nice clean duds wor ready, and Bess might 'ave em—they'd be a bit big for 'er, but she could manage some'ow.

I took the label 'ome to mother and telled her what I 'ad done, and then I went straight out.

The voice was quiet as quiet could be.

But now do yer think I felt 'appy? not a bit o' it—I never felt sorer, nor crosser, nor meaner in my whole life—I quarreled with Dick, and I palmed off withered flowers on some ladies wot thought they wor fresh, and I stayed out late and I didn't 'elp mother a bit.

I had obeyed the voice, but I felt real 'orrid.

Well, Bess went to the country and I stayed at 'ome.

That wor a year ago.

I s'pose it did 'er good going, and I s'pose I'm real glad now as I let her go. She wor there for a fortnight, and she 'eard the doves cooin', and she rode in the donkey cart, and she come 'ome wid a little tint of pink in 'er cheeks, and a little glint o' sun in her eyes, and her mouth war soft-like, and her face wor like satin when I kissed it. Bess 'ad a 'appy fortnight, and course I'm glad to think on it now.

It did 'er good o' course, but, bless yer, it didn't save 'er—her cough got worse agen when the cold weather come, and she died in the winter.

She put her arms round me larst thing o' all and she says—

"Janey, I love yer, and I 'ear the white doves a-cooin'."

And she smiled wonderful then and looked hup as ef she wor staring straight through the ceilin'.

I'm glad I let her go, o' course, now.

Well, wot do yer think?

Country 'Oliday time is comin' round agen, and I'm to go this year.

Mother ha' jest come in and told me. She says the Committee ladies 'eard about me and Bess, and some'ow or t'other they managed as I should 'ave my lark this year, though I thought I wor too old.

I'm ter go! I'm ter go! I'm real *Lucky Jane* this time, and no mistake.

It's 'arf an hour sence mother come in and told me, and I ha' run out cause I'm so real glad I jest can't stay stified up in the 'ot hattie.

Dear, dear, I am 'appy. Why look you 'ere, I'm so down right 'appy, that ef mother said to me: "You come along to meetin' with me, Jane," why I think I'd jest up and go. I feel so 'appy I wouldn't mind turning good for a bit. Seems to me that bein' 'appy 'grees with me, and takes the fierceness out o' me, and makes me sort o' gentle.

I wonder ef I'll be sent to Mother Beech's, and ef I'll sleep in Bess's bedroom, and ef I'll 'ear the doves a-cooin'. Bess is hall right you see this year—she's in 'Eaven, and I can listop to the doves, and think on her and 'ave my own lark, and that voice won't keep a worritin'.

It's real wonderful 'ow good I feel, and all cause I'm gwine to 'ave my bit o' pleasure at larst.

But that's me, you see—that's Jane.

Wanted: A Reformed Pawnbroker!

IN the *Charities Review* of New York there is a brief paper describing the movement to establish people's banks in America, which, being examined, really comes to the establishment of a philanthropic pawnbroker. Mr. Tournier, who writes the paper, thus gives the following explanation of what is aimed at:—

The scheme of the proposed Provident Loan Company is to open offices, where the poor can borrow money at a low rate of interest. It is hoped that within a year the first of these offices can be opened. The scheme has the endorsement of the Charity Organisation Society, but the movement is not a charitable one, and is not part of the work of the Society. One hundred thousand dollars is being raised by persons interested in the movement, to put the scheme into operation. Shares will be issued with the distinct understanding that at no time will more than a limited dividend be paid. Any surplus of profits, after paying necessary expenses, will be used to extend the usefulness of the benefaction. Only one per cent. interest per month will be charged, and every opportunity will be given to borrowers to redeem their goods. Instalments of one dollar will be received until the full amount loaned is paid, and if necessary an extension of the time allowed by law wherein to release articles will also be given. No charges will be made for "hanging up" articles. There is no doubt in the minds of the promoters of the Provident Loan Company that from a moral and a financial point of view the scheme will be a success.

A Steam Man.

IN *Cassell's Family Magazine* it is mentioned that Professor George Moore, an American inventor, has devised a mechanical man actuated by steam, which is described and illustrated in an American scientific journal. The figure is six feet high, and made of steel in likeness of a mediæval knight in armour, with the top of the funnel concealed by the plumes of his helmet, and an escape-pipe from his visor resembling a cigar. The trunk of the body contains the furnace, boiler, and engine, the limbs the mechanism for walking. The figure is intended to pull a cart, and walks briskly at a pace of five miles an hour.

THE CIVIC CHURCH AND ITS WORK.

A VOICE FROM AMERICA.

MR. B. O. FLOWER in the *Arena* for June has a very singular and useful paper entitled "Union for Practical Progress." It is in substance a plea for the establishment of an association that would promote good work on lines broader than that of any of the Churches. Mr. Flower maintains, rightly enough, that the name of such an organisation should be broader than that of any sect, and therefore he rules out the Brotherhood of Christian Unity as being too narrow. One of his correspondents suggests that they should be called the order of "Servants of Humanity," while another proposes "Sons and Daughters of Columbia"; Mr. Flower prefers the "League of Love," or the "Federation of Justice," and he has drawn up the following pledge which he proposes all members of the League should take:—

A SUGGESTED PLEDGE.

Believing that the progress and the happiness of the race depend on the supremacy of that lofty love which comprehends the highest expression of justice, and stands for soul-developing freedom, I hereby agree, in so far as lies within my power, to express by my every thought, word, and action a deep, pure, and abiding love for every child of humanity; especially will I seek to brighten the lives and strengthen and develop the characters of those who, through unfortunate environment, through weakness or adversity, most need my assistance.

I promise at all times to demand the same ample and impartial justice for the most unfortunate of my fellow-men as, under similar circumstances, I should demand for myself. I promise to demand that each individual be accorded the same fair and candid consideration in the expression of his honest convictions which I should demand for myself.

Furthermore, appreciating the value of a broad or comprehensive education in developing an ideal manhood or womanhood, I promise to improve every opportunity to cultivate all that is best and noblest in my own life, while seeking incessantly to stimulate the intellect and develop the character of all coming within the scope of my influence who may need my aid.

Something like this might be adopted as a general pledge, while associations could organize and adopt such bye-laws as might seem most desirable.

THE TEACHING OF STARVELINGS.

One of the most important objects of the League would be to seek and save poor little starving children whose brains and souls are being shrivelled up both in country and in town. He would organise these children into clubs, with some members of the League as elder brothers and sisters, whose duty it would be to guide and direct the young into paths of rectitude, and create the hunger for knowledge; others would teach the children to sing, others again would tell them stories once or twice every week, emphasizing some of the great lessons prominent in noble lives. Once a month members might give a picnic supper to the children and their fathers and mothers, brothers and sisters.

OTHER FORMS OF HELPFULNESS.

Now, through orders or leagues such as we are discussing, the members would be brought into *rapport* with these unfortunates, while the various beneficent measures inaugurated would have a tendency to divorce them from the worst influences in our social life, as a part of the regular work would be to provide concerts and various forms of healthful amusement, and establish circulating libraries, coffee houses, reading rooms, free lectures, kindergarten and sewing schools for Saturday afternoons.

Mr. Flower describes Dr. Coit's Neighbourhood Guilds, and Dr. Adler's Society for Ethical Culture, and then adds:—

THE CIVIC CENTRES.

Since writing this paper, I have read with great interest, in the English edition of the *REVIEW OF REVIEWS* for March, Mr. Stead's account of a movement along these general lines which is already gaining a strong foothold in England. I refer to the establishment of Civic Centres in the various cities. These are organizations which are formed to aid the best and discourage the worst in city life. The progress being made in England is glorious, and confirms my impression that the heart-hunger of the age calls for a new crusade—a great world union for the betterment of men.

THE REFORM OF THE POOR LAW.

A HINT FROM DENMARK.

WHILE the Royal Commission on the Relief of the Aged Poor continues to hold its meetings in England in secrecy, evidence is accumulating which shows that instead of leading the world in the treatment of her aged poor, England has much to learn from some of her neighbours. We published in a recent number of the *REVIEW* some account of the Austrian poor law. The *Economic Journal* for June contains an interesting account of the conditions of state relief in Denmark by C. H. Leppington, from which it would seem that only two years ago Denmark remodelled its system of poor law relief.

The new Poor Law Act of the 9th of April, 1891, came into operation in Denmark the following January. Its framers appear to have shared the view that the repugnance felt by the decent poor towards the workhouse, and their readiness to endure considerable privation rather than enter it, is reasonable, and entitled to consideration. It is therefore provided that only such persons as cannot be assisted in their own homes may be removed to a poorhouse. Even if they have to go in, they must not be compelled to herd with persons of bad character, but must be accommodated in separate establishments, or at least in separate wards. The same rule applies to children. To make such a separation easier, the Act directs that a workhouse (*Arbejdsanstalt*), as distinguished from a poorhouse, must be set up in every county. The practice, familiar in the history of our own poor law, of refusing house-accommodation to workpeople newly arrived in a neighbourhood, lest they should obtain a settlement in a commune of which they are not natives, is indirectly prohibited by a clause which imposes on the authorities of such a commune the duty of providing new-comers with rooms at the ordinary rent of the locality, if they cannot otherwise obtain them. A member of a sick-club who continues to be unable to work after his club-allowance has ceased, is to receive relief from his commune to the amount of his club-allowance until he can return to his work, and this assistance is not to be counted as poor-law relief. Nor does the receipt of medical relief bring with it medical disqualification. And although relief given to any person for whom another is responsible (e.g. as parents for their children) is to be reckoned as relief given to the latter, this rule does not refer to the case of blind or deaf and dumb children, nor to the insane. By other Acts passed within the past few years, it has been provided that, when the authorities have made an order on the father of an illegitimate child to make the mother an allowance in respect of it, the mother can demand payment of the allowance from the Guardians of the commune in which the man resides, who have, of course, their remedy against him. In 1889 there were 1,181 such cases. And the conditions imposed by the Act of 1891 upon the nature of the relief to be granted to the better class of aged poor have been supplemented by another Act, which prescribes that the communes are to receive a subsidy from the State towards the support of the poor of this class. This relief, too, which usually takes the form of money, is not to entail the disadvantages incident to ordinary poor-law relief, nor are the recipients regarded as paupers. The resulting effect of these two Acts is to create something very like a system of State pensions.

TEMPERANCE SOCIALISM IN SWITZERLAND.

MONOPOLY AS A SHORT CUT TO REFORM.

MR. JOSEPH KING, in a recent number of the *Economic Review*, has an interesting paper upon "The Alcoholic Monopoly in Switzerland." Mr. King is much enamoured of the attempt which has been made by the Swiss to grapple with the drink problem as a socialistic basis. The consumption of spirituous liquors per head has fallen from 8 litres to a little more than 6 litres per head. He points out, however, that this is only one phase of a general movement in Switzerland towards the establishment of State monopolies:—

The financial and administrative success of the alcohol monopoly has given a strong impulse to the idea of the Swiss Government acquiring further monopolies. Of course, the Swiss Post Office is a Government monopoly, and in a larger sense than our British Post Office is, since it owns the whole telephone system of Switzerland, with ten thousand subscribers, and over six million conversations annually, and it owns the network of diligences which carry passengers over hundreds of miles of road and over a score of mountain passes. The manufacture of gunpowder has long been a Government monopoly. The privilege of the banks, which now issue the paper currency of the country, has long been the subject of criticism; it has been proposed that the issue of bank-notes should be a Government monopoly. In 1880, the proposal was submitted to the popular referendum, but rejected by a majority of 139,027; only a year ago it was again submitted to the referendum, and carried by a majority of 72,963. The subject will certainly form the matter of early legislation. A step has already been made towards the State ownership of the Swiss railways, and there is a growing feeling in its favour. The system of national insurance against sickness and accident, which was demanded two years ago by the referendum, and a majority of nearly 200,000, and which will soon be in working, is admittedly the beginning only of a policy by which the State will undertake more and more in the interests of the citizen. The leaders of this policy frankly say that other State monopolies must follow to provide the necessary funds for this policy of State beneficence. The various objects which have been seriously suggested as the subject of fresh monopolies are very varied; besides bank-notes, railways, and insurance, which have been just mentioned, there are proposals in the air for State monopolies of petroleum, water-power, sugar, condiments (viz. salt, pepper, etc.), public advertisements (the French *annonces*, German *annoncen*), and, lastly, tobacco. Tobacco is already a State monopoly in other countries, e.g. Austria and Italy; and it is easy to create a monopoly of an article which, like tobacco, cannot be produced without every one in the district seeing it grow. But before all these monopolies comes one which is at the present time one of the most pressing questions before the Swiss people, viz. whether or not the manufacture and importation of matches shall become a Government monopoly, as it has already been for some years in France. The Swiss Council of State (or Senate), the more conservative of the two Chambers, has already passed a law for creating a monopoly of matches; and if the Lower Chamber and the popular vote of the referendum go in its favour, this will be another Government monopoly. The reasons in favour of this monopoly are almost entirely philanthropic: it would not bring in any appreciable income, but it would enable the Government to stop that awful disease of the match-maker known as necrosis, which factory inspection has hitherto been unable to do.

It is remarkable, and a good omen for the future, that the greatest step which the Swiss have yet taken in Socialism was taken to cope with the greatest moral evil besetting Europe to-day—the evil of excessive alcohol drinking. The Swiss nation has shown, what all Europe should be glad to learn, that legislation may lessen the evils of drink without interfering with individual freedom; that a policy of State Socialism may be one of higher morality and of economical and efficient administration, and that moral regeneration and progressive statesmanship cannot afford to part company.

THE SCANDINAVIAN SYSTEM.

There was an interesting and elaborate article in the *Scottish Review* on "The Regulation of the Drink Traffic," by John Mann, jun. He, like most people who are not wedded to the doctrines of the United Kingdom Alliance, is a strong Gothenburger. He sums up his conclusions at which he has arrived after a study of the subject, as follows:—

The Scandinavian people as a whole are richer by some millions of pounds, which would otherwise have gone into the pockets of private traders.

Broadly, the whole record may be said to prove that the system of eliminating private profit from the sale of drink is not only possible, but expedient; that the traffic may be undertaken successfully and efficiently by companies or corporations which supplement their negative policy of control and restriction by the equally important constructive policy of directly ministering to the welfare, comfort, and happiness of the people.

It is understood that a large section of American politicians regard the system as the solution of many of the difficulties of the drink traffic. Further, a very important Commission in New South Wales has also investigated and reported in favour of the system. In 1887, Switzerland, after careful inquiry, adopted the principle in regard to the wholesale trade, and the reports received at our Foreign Office bear testimony to the satisfactory results of the policy, for it has been attended by financial success, great care and precaution against adulteration, and a remarkable reduction in the amount of spirits consumed. One tenth of the profits are devoted to combating the evils of alcoholism, a provision worth incorporating in any future legislation.

Drink Bills in America and Australia.

MR. FITCHETT, writing in the *Australian Review of Reviews* on the Drink Bills of New South Wales, says:—

Tectotalism, somehow, with all its eloquence and all its "triumphs," never seems to affect the huge flood of intoxicating drinks poured annually down the national throat. The figures prove that the Drink Bill of New South Wales for the last ten years amounts to nearly £50,000,000 sterling; and the colony has thus accomplished the astonishing feat of pouring down its own throat during that period more than the sum total of all its loans, or the cost of all its railways! The value of all the minerals produced in the colony since the first white man landed on its shores is barely £100,000,000 sterling; but all the gold and coal and iron which this richest of colonies produces in fifty years it drinks in ten! The financial difficulties of New South Wales are plainly only skin deep. The sacrifice of every fourth glass of beer would bring them to an abrupt end.

An advocate of prohibition, writing on the "Annals of Alcohol," makes a very startling statement as to the enormous increase of drink in the United States. Considering all the Temperance agitation that has been going on there for so many years, it is rather disheartening to be told that the drink is increasing to £20,000,000 sterling per annum. The writer says:—

Mr. Brown states that there is annually spent for liquor in this country \$900,000,000. This was a true statement three or four years ago. But this amount is increasing at the alarming rate of almost \$100,000,000 per annum. In 1891 it had increased to \$1,200,000,000. This is to say, that the amount of money uselessly spent for liquors in the United States simply to satisfy the appetite (leaving off the revenue derived from the traffic, and the good results from the use for industrial, artistic, mechanical, and medicinal purposes) would, each year, pay all the expenses of the United States Government, and all the collections made on account of tariff, and for all property destroyed by fire in the United States, and leave the nice little sum of \$77,811,525 for "pin money."

THE CIVIC LIFE OF CHICAGO.

AN IMPRESSION LEFT ON A GUEST AFTER A VISIT OF A DOZEN DAYS.

THE science of cities promises to become one of the most fascinating branches of the new sociology.

At present but slightly developed, its rudiments stir even an amateur to enthusiasm. The civic sense has been re-born amongst us, and as we pass, though hurriedly, from city to city, we look on them with "other, larger eyes" than those of the mere sightseer. We see no longer mere shows of the builder's skill or of the landscape gardener's art. We look for embodiments of the civic soul. Even where there is a magnificent display of ancient architecture and a rich store of historical associations—as, for example, in Oxford—the absence or meagreness of the civic spirit affects us painfully. It is perhaps in the New World that we become most conscious of the new attitude. Being there undistracted by the glamour of antiquity, we are able to view the city simply as a corporate expression of the existing local life. We see the civic idea of modern humanity taking shape before us, unfettered by the petrified conceptions of the past. Few things, I may confess, have given me keener pleasure than to watch the fresh forms assumed by the English town as it springs up on totally new soil. My opportunities were limited. They rarely went beyond a day or two of sympathetic observation, and sometimes amounted to only a few well-filled hours between trains. But the local individuality is not slow to reveal itself, and one soon comes to discern the peculiar flavour of the local life. Memories of glimpses of Montreal, Toronto, Hamilton, and, among other lesser towns, the Ontarian namesake of our imperial capital, are as precious to me as any specimens gathered by naturalists in a newly-discovered land. But these Canadian impressions, pleasing and striking as they are, may not compare with the impact made on the mind by the gigantic Queen of the West, the chief warden and chief wonder of the World's Fair—the city of Chicago.

THE FIRST IMPRESSION OF CHICAGO.

Perhaps one of the first ideas suggested to the stranger by Chicago is that of vastness. This is due not merely to the great extent of the actual area, it is possibly as much caused by the flatness of the surface, the length of the streets, and the wide intervals of houseless land. It is an impression dear to the Chicagoan heart. "This is certainly a city of magnificent distances," I remarked somewhat impatiently, on reaching a friend's house, after pacing several miles of one of the seemingly interminable avenues. "It is very good of you to say so," rejoined my host, graciously, "after coming from London." I may be mistaken, but I rather imagine that already Chicago has begun to eye the British capital as the only serious rival to the civic immensity which she counts on as her certain future. To remind a Chicagoan that after all the Old Country possesses the very biggest city in the world is felt by him to be something of an affront. He has one retort, which is unailing. "Look at the time you've had. You have taken nearly two thousand years to get together just about four times as many people as we have gotten here in fifty years. Give us as good a start, and then see!" The words may vary, but the point remains the same. Even a small boy of some ten years, whom I came across one day in the streets, had it all ready to fire off at the Britisher.

THE CAPITAL OF BROODINGNAG.

The variety of things that Chicago possesses which are truly described as of their kind "the greatest in the world," naturally induces in her citizens a certain superlative self-consciousness. The stranger grows somewhat weary of this comparison with the achievements of the rest of the planet, and is tempted to be a trifle-malicious. "We have in Chicago the longest street in the world," said a friend to me one day. "Ah, and how long is that?" "Halstead Street, sir," was the reply, "is eighteen miles long." "We can beat that in the Old Country," I could not resist saying. "Impossible!" "Yes; we have a street over three hundred miles long. It is called Watling Street." Yet, I must admit, that until I was in Chicago I never saw so vividly the reasonableness, not to say necessity, of the "tall talk" which we have remarked in our American cousins. The scale of language which applies to the Old World does not come up to the requirements of the New. I had not been twenty-four hours in the Lake City before I found my lips becoming perilously familiar with "enormous," "tremendous," "colossal," and other such grenadiers of speech. I began to admire the diction of my American friends as something quite moderate.

BUT ONLY HALF BAKED.

Next to its vastness, the unfinished and unequal appearance of the city must strike the European visitor. Beside it even our sprawling leviathans of towns seem compact and trim. It is in many respects a huge cluster of incongruities. The rectangular regularity which so severely rules the lines of the streets is balanced by the most startling irregularity of architecture. The "skyscraper" and the shanty stand side by side. The slight wooden or frame house alternates with buildings of granite put together in the most massive style. Where stone is used, whether for places of business or dwelling-houses, I noticed that the architecture generally bore a very ponderous and somewhat sombre appearance. Villas on the boulevards seem to have been constructed on the model of a feudal keep. One might be tempted to fancy "They dreamt not of a perishable home Who thus could build," did not a neighbouring villa, obtrusively wooden and fragile, suggest precisely the opposite conclusion.

A CITY OF CONTRASTS.

Even the sidewalks know no mean between extremes. These are either of solid, impervious, perfectly level concrete, or a flooring of deal irregularly laid, dropping now a foot or six inches without notice, now rising equally suddenly, and by even more treacherous depressions and elevations of an inch or so, playing havoc with the toes and the temper of the unwary pedestrian. "Ponder the path of thy feet" is a precept the stranger learns to value in Chicago streets. The same genius for contrast presents you with great patches of raw prairie within a few yards of some of the finest boulevards in the world. Nay, in the very heart of the city, at the corner of one of the busiest blocks, where the whirl of traffic is at its fiercest, and all the appliances of the latest modern civilisation are in full swing, close to sky-soaring "temples," elevators, telephones, electric light, almost grazed by the cable-cars, I found a veritable unmistakable tree-stump. It was, of

course, cut down to the level of the road, but there it stood, an eloquent reminder of the wilds which reigned around it sixty years ago. What a place for some Chicago laureate to meditate—O stump what changes hast thou seen! There where the long street roars hath been The stillness—of the dismal swamp.

THE MOUNTAIN SCENERY OF THE CITY.

The enormously tall buildings for which Chicago is famed did not impress me quite so unfavourably as I had anticipated. Seen from the Auditorium tower, they serve agreeably to diversify the civic scenery, a service which the flatness of the situation and the monotonous straightness of the streets renders peculiarly acceptable. What other cities possess in the natural undulation of the ground, Chicago creates for herself by her irregular mountains of masonry. The Woman's Temple is an imposing erection, though in its architecture scarcely suggestive of feminine grace; and the meagre dimensions of its assembly hall struck me as hardly in keeping, either with the rest of the edifice or with the colossal projects of "the World's Women." Yet would that London boasted an equally splendid monument to the progress of the woman's movement!

A WORLD CITY.

The heterogeneousness which I observed in the appearance of the place was not less marked in the people. "Chicago is a foreign city," is a frequent remark of the American resident. She would be better called a world-city. So great is the crowd of nationalities present and so swiftly has the population gathered that the distinction of "native" and "foreign" is out of place. Chicago is one vast crucible, wherein is being poured ingredients from all races, and one looks with wonder to see what strange amalgam promises to result. There is here a sort of civic epitome of mankind, and if Brother Jonathan can succeed in thoroughly Americanising Chicago, he need not despair of Americanising the world. From the faces I met in the streets I judged that the preponderant type is the German, slightly sharpened towards the American. On looking up my guide-book I was glad to find statistical corroboration of this opinion; for Germans form one-third of the population. Native Americans make less than one-fourth. If the national ingredients should become more fairly proportioned, will the Chicagoan of the future prove to be, as it were, the composite photograph of man? It is the possibility involved in this question which invests the civic life of Chicago with such interest for the student of humanity.

CORRUPTION IN THE MUNICIPALITY.

At present, however, disproportion reigns not merely in the composition, but also in the character of the corporate life. In some respects Chicago is a model of civic unity. The *Christian Union* quotes from "a thinker and observer of rare philosophic mind" the proposition that "Chicago represents better than any other American community the true principle of civic life. It stands for the civic spirit; it is an organic community." This is high praise, which, in presence of the World's Fair alone, a stranger cannot declare to be undeserved. A colossal city which has sprung into being in less than sixty years, and has twice risen again from a tomb of fire, must, he is bound to argue, possess a tenacious unity of will. And yet he finds her best citizens groaning under the sway of the saloon-keepers. After Mammon, the most potent demons in Chicago are confessedly those of drink, debauchery, and gambling; and when these three vile

powers combine to corrupt municipal politics, the result may be imagined.

THE WORST SLUMS IN THE WORLD.

A few days after my arrival I was fortunate enough to meet a group of earnest social reformers, who were discussing the condition of the lower strata of Chicago life. One of them, a friend of mine connected with a University settlement in East London, and well acquainted with the darkest districts in the metropolis, startled me by saying that he had found worse slums in Chicago than he had ever seen in London. "Our rookeries," he said, "are bad enough, but they are at least built of brick or stone. Here, however, the low tenements are mostly of wood, and when the wood decays or breaks away the consequences are more deplorable than anything we have in London."

This was the testimony of a visitor. It was confirmed by the testimony of resident sociological experts. One of these was a lady, at present engaged by the National Government in investigating and reporting on the life and homes of the poor in Chicago. The awful state of things she described greatly surprised me, and I suggested that it was due to the presence of the large foreign element.

NOT FOREIGN, BUT AMERICAN.

"On the contrary," she replied, "the very worst places in the city are inhabited by native Americans." And she showed me the official chart of one of the lowest streets, on which the tenements were marked white when occupied by native Americans, black when occupied by foreigners. The rooms to the front which possess the worst character were white.

These carefully ascertained facts knock the bottom out of the complacent assurance which I have since so often heard expressed, that foreigners were responsible for the darkest shades of Chicago life.

"Is this state of things allowed by law to exist?" I asked.

"Certainly not," replied the lady; "it exists in flat contravention of every municipal ordinance."

"Can nothing be done to enforce the law?"

"The very men whose duty it is to enforce the law are the nominees of the classes interested in violating it."

"Can you not rouse the churches to combine and put a stop to this municipal corruption?"

"The churches!"—the lady spoke with infinite scorn—"the proprietors of the worst class of property in Chicago are leading men in the churches. I have more hope of arousing the poor Polish Jews to a sense of their civic duty and opportunity than the churches. The Poles, poor as they are, and ignorant, do want to lead a decent life."

A TIMOROUS PRESS.

"Is there no one who will stir the public conscience on these questions? Have you no pressman who will dare to do it—no journalist of the heroic type—no knight-errant of the pen?"

"We tried hard to induce the proprietor of one of our leading newspapers to take up the matter on his own account, and to compel the municipality to do its duty. But he absolutely declined. He said he would publish signed communications from us, but he could on no account commit the paper to the crusade. The reason he gave for his refusal was that the persons most concerned in the maintenance of these abuses were among the principal men of the city, and, though he fully admitted the justice of our complaint, he dared not alienate them. It would ruin his paper."

These statements, I need hardly say, I heard, and I repeat with great regret. Any city has come to a serious pass in which those who make their fortune out of the squalor, disease, and shame of their fellow-citizens are powerful enough not only to control the municipal authorities, but also to check the Church and awe the Press into silence. I was not, of course, in a position by personal research to corroborate or qualify what I was told. But the responsible official position of my informant more than justifies me in making it public.

THE DOMINATION OF BUNG.

I rather fancy, however, that the people who are in earnest about civic righteousness were in a somewhat desponding mood. They had rallied for a great fight over the last mayoral election, and had felt themselves badly beaten. The nominee of the party—civic laxity, let us say—had been swept into office by a majority of some score thousand votes, and during the World's Fair he represents Chicago to mankind. This was naturally dispiriting. Yet, if a judgment formed on knowledge as meagre as mine necessarily is possess any value, I should regard that mayoral contest as the beginning of better days for municipal integrity. Much was achieved when the forces of religion and morality were organised into something like electoral unity, and fought a pitched battle on great issues independent of party. It is possible that the discipline of defeat may do more than the elation of any easy victory to make the civic conscience permanently and compactly effective. Time will show.

A HEROIC CHIEF OF POLICE.

In the meantime, Chicago is fortunate in possessing and retaining at the head of her police a man who thoroughly believes in the supremacy of conscience. Major McLaughrey was appointed Chief of Police by the late mayor in 1891, but he happily regards himself as responsible to a higher than vote-made authority. He is an avowed Christian man, and a Presbyterian to boot. He has not shrunk from doing what he conceived to be his duty in the very teeth of municipal opposition. He has dared the wrath of the worst elements in Chicago, and so far he has come off victorious.

Let me tell the story of the struggle as it was told to me. The fight for civic reform is after all not less interesting than the exploits of our military heroes, and, alas! is not without its sanguinary episodes. Towards the fall of last year a combination of persons, which obtained the expressive sobriquet of "the Gamblers' Syndicate," made evident their intention of organising a deliberate revolt against the law. Their "hells" were kept open in defiance of statute and police order. But the head and front of their offending, as well as the point around which the battle raged, was the carrying on of races without a license in a certain park. This was described to me as the most notorious race-track in America, thousands of people being there regularly robbed and fleeced.

HOW HE CLOSED THE RACE-TRACK.

At last the crime against public decency, as well as public order, evoked a great outcry. Major McLaughrey

MAJOR E. W. McLAUGHREY.

ordered the track to be closed. Then came the hornets' nest about his ears. The powers behind Slum Saloon and Gambling Hell marked him out for their prey. The City Council was against him. The mayor also wavered. Here was a spectacle for brave men to admire: a chief of police heroically maintaining the claims of law and probity against a vast conspiracy of evil, and refusing

the displeasure of his municipal masters. It was expected that the chief would be deposed. Suits for heavy damages, said to have been caused by his closure order, were brought against him, in the hope of intimidating him, or, in the event of some distortion of justice, ruining him financially. For the municipality declared it "one of the privileges" of the chief's office that he should be left to defend himself for his official acts at his own cost and own risk. This was "facing fearful odds." The spirit in which he stood his ground is shown in a letter to a friend, Mr. H. H. Van Meter, in which he wrote, "I trust they will not be able to pile up damages high enough against me to frighten me from my line of duty. If they take my all, it will not help them much. If I can come out of this ordeal with my good name unimpaired, and the interests of the city at least uninjured, if not

advanced, and the cause of general morality and decency somewhat promoted, I shall feel rewarded for the labour and annoyance of this very trying and vexatious position."

Happily for the credit of the city, the brave man was not sacrificed to his foes. An appeal was issued by a zealous apostle of civic reform, and distributed broadcast, calling on all "reputable citizens" to unite in defence of their chivalrous officer. Such a vigorous expression of public opinion was evoked as dispelled all fears of the chief's dismissal, and strengthened by the support thus afforded, he proceeded to yet more decisive measures. His order for closing the race-track he rigorously enforced. He had to deal with desperadoes who "did not hesitate to shoot." Several of his officers were killed in the struggle. But the Major was finally triumphant. The race-track was permanently closed.

THE SUNDAY CLOSING OF THE WORLD'S FAIR.

When the municipal elections came round this spring, and the representative of civic laxity was elected mayor by an enormous majority, the fear was general that here was a notice to Major McLaughrey to quit. While the matter was still in uncertainty, the World's Fair was opened. And now emerged an incident which throws a strange light on the Sabbatarian sentiment of Christian Chicago. During the first week of the Fair there was a general apprehension that in defiance of what then appeared to be the law the gates of the Fair would be coolly opened on the Sunday. Now it so happens that while the Columbian Guards have police powers inside the Fair grounds, Major McLaughrey's jurisdiction extends at least up to the very gates of the Fair. If to enter the Fair on Sunday were an infraction of the law, then the city police would be within their duty in preventing any persons from entering. But the City Council had voted unanimously in favour of allowing the park gates to be opened on Sundays. Here was the

material for a fine complication of authorities which might result in something more serious at the gates were they actually opened. Yet religious people confidently looked to Major McLaughrey—with his position hanging in the wind at the mercy of a mayor elected by his foes, with the City Council unanimously approving Sunday opening—to bar the way to the crowds on Sunday, even were the entrance open. This expectancy shows the stuff the Major must be made of.

WANTED: "MEN WHO CAN FIGHT."

The eager advocate of civic reform, to whom I have already alluded, was prepared for the emergency, should it arise. "See here," he said to me, producing a sheet of signatures. "These are names belonging to some of the best families in Chicago. They are names of men who hereby pledge themselves to stand by Major McLaughrey should the Fair gates be opened on Sunday. He will have a difficult task, and he needs to have his hands strengthened."

I naturally thought of moral support only being thus tendered. My friend seemed to perceive this, and so he proceeded, "These are the names of young men, strong men," and lowering his voice to a whisper, he added, "*men who can fight!*"

I understood it now. This is the way the Christian conscience enrolls its special constables in Chicago. It seems rather strange to British minds, this possible spectacle of stalwart Christian young men, armed with Derringers, going down on a Sunday to "stand by" the Chief of Police, as he endeavours to uphold the law of the Sabbath against a mob of pleasure-seekers who are eager to enter the open gates of the Fair.

Fortunately, the sanguinary possibilities were not realised. The directors did not venture to open the gates on Sunday until they had legal warrant for doing so. And our valiant Chief of Police has not been dismissed. His retention in office was signified by the mayor pleasantly replying to his request for instructions with the bidding to mind his own business. Visitors to the World's Fair may go the more securely in that they know the city is in charge of an officer who represents the best elements of Chicago life.

THE LADIES OF HULL HOUSE.

There are many other signs of the growth of civic religion. Of these, not the least promising is the work carried on at Hull House. This is a woman's university settlement, which has been planted right in the midst of the darkest district of the city. It is the centre of many-sided social amelioration. Its Ward Improvement Committee especially is doing splendid service in educating the local municipal conscience. My friend from East London, to whom I have before alluded, tells me that he has visited all the principal university settlements in England and the United States, but nowhere has he seen such excellent work as is done by the ladies at Hull House. To compare this outpost of civic reform with the dream of Tennyson's "Princess" is to learn afresh how much more poetry may be found in real life than in romance. The Lady Ida of this Academy combines the broad and healthy culture and the brilliant charm of the modern American woman with the unobtrusive devotion of a mediæval nun. Among the civic saviours of Chicago I should judge that few will rank higher than Miss Jane Addams.

SOCIAL CHRISTIANITY.

The churches also seem to be waking up in earnest to the need of what Mr. Hugh Price Hughes calls "social

Christianity." I spent some delightful hours in the Armour Institute, a glorified polytechnic or scientific academy, which the millionaire whose well-known name it bears has just built in one of the poorer districts. To this noble agency, with its threefold aim of imparting "knowledge, skill, and culture," Rev. Dr. Gunsaulus, one of the leading preachers of the city, devotes no small amount of his multifarious energy. The Chicago Congregational College has taken an important step towards socialising the ministry of the future by founding a Chair of Christian Sociology, and by drilling its two hundred students in actual social work. Mr. Moody complains, indeed, that between the churches of Chicago, with their luxuriously carpeted and cushioned places of worship, and the working classes, the gulf of separation grows every day deeper and broader. The sociologising of theology will, however, prove one of the best means of counteracting this baneful tendency.

A WORLD CENTRE.

For there is something in the very air of Chicago life which it is an exhilaration, almost an inspiration, to breathe. It is hard precisely to hit off, but it may perhaps be described as the blending of an imperial outlook with a world-conquering energy. Possibly owing to her cosmopolitan population Chicago possesses what may be called a sort of omni-national consciousness. Her plans and projects have no mere local or continental range. She has an eye ever to the whole world. Even in her religious arrangements this wide vision is apparent. Dr. Goodwin, pastor of the First Congregational Church, in talking to me about the work which Chicago Congregationalism has to accomplish, spoke of the entire North-West and even of remote Alaska as though they were but an annexe to the Lake City. Mr. Moody, in arranging evangelistic operations during the Fair, brings Dr. Pindor from Poland, Dr. Stöcker from Berlin, Dr. Monod from Paris, besides a host of noted evangelists from Great Britain. It is quite in keeping with the general ecumenical temper of the city that it is the home of the first Parliament of the world's religions. In ideas, as in breadstuffs, it aspires to be the market of mankind. And behind this ambition lies a will of feverish speed and iron peremptoriness. The indomitable enterprise of Chicago has imprinted itself on the universal consciousness. The city itself is a monument of mastery over circumstance. It has reared the greatest buildings in the world on a foundation of treacherous swamp, and has risen twice in twenty-five years from a fiery ruin to be the second city in the hemisphere. As a venerable missionary from Zululand accompanied me from one spectacle to another of Chicago's colossal activity he repeated with deep feeling a saying of the Zulus: "O white men, nothing ever conquers you but death." One feels as though nothing short of the annexation of a new planet will furnish outlet sufficient for the exuberant energy everywhere manifest.

Born of the most masterful decades of the nineteenth century, the child of steam, electricity, and world-wide exchange, reared in the simultaneity of world-consciousness which the daily newspaper creates, with no traditions to hamper or internal *vis inertiae* to overcome, Chicago stands out as the very embodiment of the world-conquering spirit of the age. If she only succeeds in subduing the vices of her youthful blood, and in rounding out the finer capacities of her intellect, her destiny may yet prove to be not less imperial than is her present temper.

F. HERBERT STEAD.

THE NEW BOOKS OF THE MONTH.

NOTICE.—For the convenience of such of our readers as may live at a distance from a bookseller, any Book they may require, mentioned in the following List, will be forwarded post free to any part of the United Kingdom, from the Publishing Office of the REVIEW OF REVIEWS, 125, Fleet Street, on receipt of Postal Order for the published price of the Book ordered.

Index to Periodicals for 1893. (Horace Marshall and Son, 125, Fleet Street.) 4to. Cloth. Pp. 192. 5s. net. Illustrated.

I publish this month the third annual "Index and Guide to the Periodicals of the World." The new volume, although it has been carefully weeded of all bibliographical matter which appeared in the previous numbers, shows an increase in size upon its predecessors. Seventy-one pages are devoted to a brief description, with the addresses, of all the periodical publications of the world, containing a mass of information that is not to be found in any other publication issued from the press. This first section of the Index constitutes, in fact, a *Gazetteer and Guide* to the magazines of the world.

The second part, which occupies 120 pages, is an index to the contents of the leading English and American periodicals of 1892. For any one studying any subject, which compels him to refer to the articles published in periodicals, this Index is simply invaluable. There is no similar publication issued in this country; and in America, Pool's "Index" and the "Co-operative Index of Periodicals" are neither so handy nor so up-to-date.

The best illustration that can be given of the value of such an Index is to quote the entries under any one head. The entries under "Art" occupy over three columns of the Index; "Armies" more than two; and "Africa" more than a couple of columns. Here, for instance, are the entries under "Mashonaland," which is one of the sub-heads of the African division:—

- Mashonaland:
Bent, J. T., on, *New R.* VI. May, 580
Boggie, A., on, *G B*, IV. July, 185
Golden Mashonaland, by F. Mandy (*map and ill.*), *Scrib.* XI. Apr. 455 (V. Apr. 394)
Mashonaland and its Development, by E. A. Maund, *J R C I*, XXIII. May, 363
With Mr. Rhodes through Mashonaland (*ill. and map*), *R R*, V. Feb. 189
The Road from Mashonaland, by J. T. Bent, *F R*, LI. Feb. 182 (V. Feb. 182)
The Geography and Meteorology of Mashonaland, by R. M. W. Swan (*map*), *P R G S*, XIV. May, 299
The Tribes of Mashonaland and Their Origin, by J. T. Bent, *Scot G M*, VIII. Oct. 534
The Ruins of Mashonaland, J. Theodore Bent on (*ill.*), *P R G S*, XIV. May, 273
Some Features of the Ruined Temples of Mashonaland, by R. M. W. Swan (*ill.*), *Scot G M*, VIII. Oct. 539
The Ruins at Zimbabwe, H. A. Bryden on, *G B*, IV. Jan. 14
The Orientation of the Buildings at Zimbabwe, R. M. W. Swan on (*ill.*), *P R G S*, XIV. May, 306

The following notice prefixed to the Index explains the principle upon which the Index is constructed:—

In addition to the abbreviations of the titles of magazines, the date the number of the volume, the month, and the page of the magazine in which each article will be found are given, while the figures in parentheses refer to the volume, month, and page of *THE REVIEW OF REVIEWS* (London edition) where the article is summarised or otherwise noticed. In case of a series of articles on one subject in one magazine, the name of the magazine is not repeated with each reference, only the month and the page, and the number of the volume where necessary.

Thus *N. C.* XXXI. Mar. 391 (V. Mar. 283) would read *Nineteenth Century*, Vol. XXXI, March, page 391, with a notice in *THE REVIEW OF REVIEWS* (London edition), Vol. V., March, page 283. Similarly, *J. R. A. S.* III. June, 205 (VI. July, 153), Sept., 463, would mean *Journal of the Royal Agricultural Society*, Vol. III., June, page 205, with a notice in *THE REVIEW OF REVIEWS* (London edition), Vol. VI., July, page 153; *Journal of the Royal Agricultural Society* again, same Volume, September, page 463.

(*Map*) means that the article is accompanied by a map, and (*ill.*) that it is illustrated.

The magazines are indexed from January to December, 1892, irrespective of volumes.

Articles are classified as much as possible, and authors' names, when available, are added. Where the title of an article affords no clue to the subject-matter, the title is given in parentheses. Poems are indexed under the authors' names; the same holds good with novelists and most other writers whose books are reviewed in the periodicals. A notable exception is Theology, which will be found under "Bible and Biblical Criticism," "Church and Christianity," etc. Critical and biographical notices of artists are given under the names of the artists, and new musical works under the composers' names. A list of artists noticed will be found under the heading "Artists"; musicians and composers under "Musicians"; dramatists, playwrights, and actors, under "Theatres and the Drama"; novelists under "Fiction," etc., etc.

A brief introduction chronicles the births and deaths of the year, and I reprint the excellent article which Miss Hetherington contributed to the *REVIEW OF REVIEWS* on the "Indexing of Periodicals," in the hope that it may induce those who index our magazines to bestow a little more pains upon the production of these useful finger-posts to their annual volumes. The Index, as a whole, is indispensable to librarians, and reflects the greatest credit upon Miss Hetherington and her staff of assistants.

HAWEIS, REV. H. R., M.A. **Sir Morell Mackenzie: Physician and Orator.** (W. H. Allen.) 8vo. Cloth. Pp. 376. 12s. 6d.

This is a brightly-written volume, giving a pleasant picture of one of the most familiar figures in English society, who during one memorable year figured so conspicuously on the stage of European politics. It is to be regretted that so genial a tribute to so remarkable a man should have been the occasion for a miserable dispute between the family, the publisher, and the author. Mr. Haweis, who undertook to write this book at the suggestion of the family, by whom he was furnished with most of the material which he required, no sooner found the work finished than for some mysterious reasons, which may be guessed at rather than asserted, the family desired the life of Sir Morell Mackenzie to be suppressed. To this Mr. Haweis agreed, on the understanding that the publisher was recouped for his expenditure on the work. For some reason or other this part of the bargain was not kept, and the publisher, being left to his own resources, appears to have cut the Gordian knot by publishing the book. Therein he has deserved well, both of the family and Mr. Haweis. It is easy to understand the desire of some eminent personages to prevent any revival of the dispute that raged round the deathbed of the Emperor Frederick.

KIPLING, RUDYARD. *Many Inventions*. (Macmillan.) Crown 8vo. Cloth. Pp. 365. 6s.

Mr. Kipling's budget of short stories grows apace, and there is no sign of failing invention or weakening power. Here are Indian tales as fine as anything in "Soldiers Three" or "Plain Tales from the Hills"; and we have, too, as a proof of his marvellous versatility and adaptability, the East End tragedy, "The Record of Badalia Herodesfoot," which on its first appearance a year or two ago did so much for the reputation of its author; the imaginative fantasy, "The Finest Story in the World"; the terror of "A Disturber of Traffic," a study of madness weird and moving in the extreme; and the rich farcical humour of "Brugglesmith." And through all these stories, widely different though they are, is to be seen Mr. Kipling's almost uncanny gift of observation, his faculty of remembering the most minute and technical details. In our opinion the cleverest stories are "A Disturber of Traffic" and "Love-o'-Women," an almost too powerful and relentless picture of remorse and disease, narrated by Private Mulvaney, who, with Learoyd and Ortheris, plays no inconsiderable part in more than one of the Indian tales. "One View of the Question" is not a story but a letter descriptive of London, and of British rule and policy, written by a native in England to a friend in India. It is a keen criticism of our social life, our state and, more particularly, of our policy in relation to India, and it is difficult to believe that it is not what it professes to be—the work of an Oriental. Mr. Kipling commences and ends his volume with a poem: the first, "To the True Romance," is rather high-falutin; the second is naval and exceedingly technical in subject, and suggests the hope that he may yet do for sailors what he has done for soldiers in his "Barrack-Room Ballads."

GOSSE, EDMUND. *Questions at Issue*. (Heinemann.) Crown 8vo. Buckram. Pp. 333. 7s. 6d.

Of all the writers of literary criticism who make a practice from time to time of collecting and republishing their critical essays from the magazines in which they first appeared, Mr. Edmund Gosse is perhaps the most interesting and the most generally readable. A wide knowledge of all literature, unequalled by but few of his contemporaries, a pleasant style, a catholic taste: these are Mr. Gosse's qualities, and they have made his new volume of essays very excellent reading. His "questions at issue" are contemporary problems. He deals with present-day reputations and controversies, not with the literature of the past. The difficulty, as Mr. Gosse suggests, of mapping the ground around one's feet is proverbial, but we have only to turn to the admirable appreciations of Mr. Robert Louis Stevenson as a poet, and of Mr. Rudyard Kipling, to see that he has come as near success as is possible. Perhaps the most notable article is that upon "The Tyranny of the Novel," in which Mr. Gosse prophesies a sudden crash in fiction unless novelists enlarge their borders and cultivate more of life than the little plot which deals with the sentiment of love. Other articles are: "The Influence of Democracy on Literature," an encouraging survey; "Has America Produced a Poet?" "What is a Great Poet?" "Making a Name in Literature;" "The Limits of Realism in Fiction;" "Is Verse in Danger?" "Tennyson—and After;" "M. Mallarmé and Symbolism;" and the "Election at the English Academy," a fantasy of extreme brilliancy, which, on its first anonymous appearance in 1891, excited much curiosity as to its authorship. In appendices, Mr. Gosse prints a lengthy letter from Mr. George Gissing, supporting his views of the poor

appreciation that poetry receives at the hands of the poorer classes; and a letter of thanks from M. Mallarmé, in which he speaks of the essay upon himself as "un miracle de divination."

BIOGRAPHY.

BISHOP, M. C. *The Prison Life of Marie Antoinette and Her Children, the Dauphin and the Duchesse D'Angouleme*. (Kegan Paul.) Crown 8vo. Cloth. 6s. New Edition. With Portrait.

DU CAMP, MAXIME. *Théophile Gautier*. (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. xviii., 231. 3s. 6d. With Portrait.

A volume of the Great French Writers series, translated by Mr. J. E. Gordon, and with a preface by Mr. Andrew Lang.

LEGOUVÉ, ERNEST. *Sixty Years of Recollections*. (Eden, Remington and Co.) Two volumes. 8vo. Cloth. Pp. 325, 330. 18s.

Translated from the French by Mr. Albert D. Vandam, the editor of "An Englishman in Paris," with which book it has a somewhat similar interest, being full of amusing and entertaining stories and anecdotes of French celebrities of the last sixty years. It is scandalous, however, that a work of this sort should be allowed to appear without an index.

TOUT, PROFESSOR T. F. *Edward the First*. (Macmillan.) Crown 8vo. Cloth. Pp. 238. 2s. 6d.

A volume of the English Statesmen Series.

ESSAYS, CRITICISMS AND BELLES-LETTRES.

DENNIS, JOHN. (Editor.) *Jeremy Taylor's Golden Sayings*. (A. D. Innes and Co.) Crown 8vo. Buckram. Pp. 181. 3s. 6d.

An admirable selection of short passages from Jeremy Taylor's works, thoroughly calculated to inspire the reader with the desire of further study. Mr. Dennis's introduction is an excellent piece of work.

DOWDEN, EDWARD. *Introduction to Shakespeare*. (Blackie.) Crown 8vo. Cloth. Pp. 136. 2s. 6d.

A revised reprint of the general introduction contributed by Professor Dowden to the "Henry Irving Shakespeare." Some paragraphs on the great tragedies and a brief notice of the interpretations of Shakespeare by great actors from Burbage to Macready have been added.

LE GALLIENNE, RICHARD (Editor). *Haslitt's "Liber Amoris; or, The New Pygmalion"*. (Elkin Mathews and John Lane.) Fcap. 8vo. Boards. Pp. xciii., 182. 5s. net.

A very beautiful reprint of a little book of Haslitt's which has long been unobtainable, but which, from the singular and curious light which it throws upon the essayist's nature, has a very real historical and literary value. But it is not as literature, Mr. Le Gallienne tells us in his charming introduction, that we must consider this narrative of the unfortunate passion for the daughter of his landlady which possessed Haslitt through so many months of his life, "but as a document, 'a document in madness' . . . and nympholepsy." In three appendices, Mr. Le Gallienne has printed all matter from Mrs. Haslitt's diary, Haslitt's own correspondence, his "Memoirs," and Mr. P. G. Patmore's "My Friends and Acquaintances," which in any way bears upon the story of the essayist's passion for Sarah Walker; and in his introduction he has striven to put the whole episode in its proper relation and proportion to the rest of his career. A facsimile of the original title-page adds to the interest of the reprint.

PATMORE, COVENTRY. *Religio Poetae, Etc.* (George Bell and Sons.) 18mo. Cloth. Pp. 229. 5s.

Some of the twenty-three essays in this volume have appeared already in the *Fortnightly Review*: the majority deal with theological and kindred subjects; the remainder are purely literary. Among the most notable are "Christianity and 'Progress,'" "Bad Morality is Bad Art," "Emotional Art," "Simplicity," "Ancient and Modern Ideas of Purity," "Distinction," and papers upon William Barnes the Dorsetshire Poet, Madame de Hautefort, Mrs. Meynell, and Valera's "Pepeita Jiménez." Each essay is replete with the closest thought, and admirably written, for Mr. Coventry Patmore has a style singularly distinguished. A certain immoderation of phrase, however, marks more than one of his essays—as, for instance, when he speaks of "that disgusting abortion, the English religious novel," or when, in writing of "Distinction" in modern literature, he says that "Mrs. Meynell alone, in both in prose and verse, almost always thoroughly distinguished." Mrs. Meynell deserves, and has had from all quarters, the most enthusiastic praise, but surely in taking account of distinction there are at least two writers who should rank as high, if not higher, than the author of the "Rhythm of Life."

STREET, G. S. *Miniatures and Moods*. (David Nutt.) 12mo. Cloth. Pp. 111. 8s. 6d.

These "miniatures which are mainly the outcome of a mood and moods which are indicated in miniature" have been reprinted from the *National Observer*, and they have the distinguishing characteristics—the preciousness of phrase and intolerance of thought—of that paper. The "Miniatures" deal

in a sprightly and interesting fashion with various historical and literary characters: Grammont, George Villiers Duke of Buckingham, Claverhouse, Rochester, the second Lord Sunderland, Etherege, the Duchess of Cleveland, Mrs. Manley, John Lord Hervey, Selwyn; the "Moods" with such subjects as Matter and Form, Insomnia, Cruelty, the Curse of Cleverness, and the Path of Rejection. These last are the sort of short papers with which readers of the *National Observer* are well acquainted, and are neither better nor worse than their fellows; but two or three of the literary "Miniatures" are admirably suggestive and thoroughly deserved reprinting.

Selections from the Writings of John Ruskin, D.C.L., LL.D.
First Series: 1843-1860. (George Allen.) Crown 8vo.
Cloth. Pp. 524. 6s. net.

Selections from "Modern Palaces," "The Seven Lamps of Architecture," "The Stones of Venice," "Lectures on Architecture and Painting," "The Elements of Drawing," "The Political Economy of Art," "The Two Paths," "Arrows of the Chase," "On the Road," etc. A steel-engraved portrait appears as frontispiece.

FICTION.

ALLEN, GRANT. Ivan Greet's Masterpiece. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 330. 3s. 6d.

In this volume Mr. Grant Allen has collected such of his more recent stories as seemed to him to possess the best claim to literary treatment. "They are," he says, "mostly those which have been written more or less to please myself. Others, however, are cast as a sop to Cerberus." Of the sixteen stories, with two exceptions, all have appeared in magazines already. These exceptions, by which Mr. Allen evidently sets some store, were "unanimously declined by the whole press of London."

BRONTË, CHARLOTTE. Shirley. (J. M. Dent and Co.) Two volumes. 12mo. Cloth. 4s. 6d. net.

The third and fourth volumes of the new and very pretty edition of the works of the Brontë sisters, which Messrs. J. M. Dent and Co. are now issuing in a form similar to their already published editions of *Pearce* and *Jane Austen*. The two volumes contain six illustrations by Mr. H. S. Grieg.

COBBAN, J. MACLAREN. The Red Sultan. (Chatto and Windus.) Three volumes. 31s. 6d.

In this story of Western Barbary at the end of the last century, Mr. MacLaren Cobban has come very near perfect success. He has opened up new ground, and has presented with great picturesqueness a race of people and a condition of life vivid and interesting in the extreme, which, if we except Mr. Hall Caine's "Scapegoat" has escaped treatment by the English novelist. "The Red Sultan" is avowedly an "adventure-story," and in telling it Mr. Cobban has evidently been much influenced by Mr. Stevenson, whose style of title-page he copies. It tells of the journey which a young Scotch lad made to Barbary in order to discover the fate of his grandfather, who had fled to Africa after the abortive Jacobite rising. The story of the "red sultan's" revolt against his father's tyrannical rule, and of the exciting incidents which follow his success, make excellent reading, but of the treatment of the plot as a whole it is impossible to speak well: it wants pulling together, and many of the characters require more careful portrayal. The "red sultan" himself, however, with his mixed nationality, his strangely inconsistent nature, and its warring elements of good and evil, is lovingly and admirably drawn.

COPE, C. ELVEY. The Pursuit of a Chimera. (Digby and Long.) Crown 8vo. Cloth. Pp. 229. 3s. 6d.

CRICHTON, MADELINE. Like a Sister. (Digby and Long.) Three volumes. 31s. 6d.

DE SAINT PIERRE, BERNARDIN. Paul and Virginia. (Gay and Bird.) Crown 8vo. Parchment. Pp. 191. 6s. net.

In view of the interest which the publication of M. Arvède Barine's biography of Saint Pierre in the Great French Writers Series has awakened, this extremely pretty translation of "Paul and Virginia" comes very opportunely. It forms a volume of the "Edition Jouaust," is illustrated with an etched portrait of Saint Pierre and five successful etchings by Laguerrière, and is in printing and binding as dainty a book as we have lately seen.

GISSING, GEORGE. The Odd Women. (Lawrence and Bullen.) Three volumes. 31s. 6d.

A few more novels such as this and Mr. Edmund Gosse will have to give something more than a passing reference to Mr. Gissing in that article in "Questions at Issue," in which he says that "the one living novelist who has striven to give a large, competent, and profound view of the movement of life is M. Zola." But Mr. Gissing is a world realist whose gloomy pessimism will have to be modified before he ever gives us first-rate work. In this book he attempts to deal with the whole question of woman's position. His "old women" are the half a million women who, one of his characters declares (incorrectly, as Mr. Grant Allen explained some time since), are destined to spinsterhood, for the reason that by that number do the men exceed the women in the England of to-day. Selecting a family of six girls, the motherless daughters of a doctor who is killed in an accident on the eve of taking out an insurance policy which shall, at least, keep them from absolute want, he traces their careers through the different stages of genteel poverty to which, by the carelessness of their parent, they are fated. Educated to no special business or profession, there is nothing open to them but to become governesses or to go into shops. The youngest marries, for the sake of a home, with tragic results; her sisters either die, or live such lives of toil and deprivation that they sink into premature old age. The lives of these women, and of the women with whom they come in contact, Mr. Gissing depicts with many way-side discussions on

burning questions. "The Odd Women" is not a little depressing; but it is likely to do much good and to provoke a deal of thought if it only drives home to its readers "the crime that middle-class parents commit when they allow their girls to go without rational training."

GOLDSMITH, OLIVER. The Vicar of Wakefield. (Gay and Bird.) Two volumes. Crown 8vo. Parchment. 12s. net.

There have lately been so many editions of this story, boasting memoirs and notes, that one is especially glad to welcome a reprint innocent of such attractions, and relying entirely upon the distinctness of its "get up" to ensure popularity. Like "Paul and Virginia" above, it is part of the "Edition Jouaust," and is illustrated with an etched portrait of Goldsmith and eight etchings by Ad. Lalauze. In its beautiful binding this edition will make an admirable present. Its text is a reprint of that of 1773, the last published in Goldsmith's life-time.

HARDY, THOMAS. Far from the Madding Crowd, and The Trumpet-Major. (Sampson Low.) Crown 8vo. Cloth. 2s. 6d. each.

The first and second volumes of a new edition of the seven novels by Mr. Thomas Hardy which Messrs. Sampson Low and Co. publish. In appearance the volumes, the first of which contains a new and excellent colotype portrait of Mr. Hardy, are uniform, except in colour, with the new edition of Mr. William Black which the same publishers are now issuing.

HOWELLS, WILLIAM D. The World of Chance. (David Douglas, Edinburgh.) Crown 8vo. Cloth. Pp. 375. 6s.

This story commences excellently with a description of the reflections of a young journalist who is leaving the country town in which he had made for himself a certain reputation, to seek literary fame and fortune in New York. But after the interesting account of his first attempt to induce some friendly publishers to take the novel which he had brought with him, and on which he had based his hopes of success, it begins to drag somewhat, and the reader is not likely to have his attention awakened by some tedious economic and political discussions which, for no apparent reason, Mr. Howells has imported into his story. At the end, however, it brightens up, and although one is sorry that it was not written to half its present length, one finishes it with a distinct feeling that, if not as good as the majority of its author's previous works, it is a novel above the average. Much of the characterisation is excellent, and the glimpses one gets into the working of a New York publishing house are very interesting.

PEARCE, J. H. Jaco Treloar. (Methuen.) Two volumes. 21s.

In spite of its crudeness and immaturity, Mr. Pearce's last book, "Inconsequent Lives," was the work of an artist, of an artist who had not thoroughly accustomed himself to his medium of expression. "Jaco Treloar" has all the faults of that story exaggerated, all the immature tricks of style, the angularities of presentment. A disciple of Mr. Hardy, Mr. Pearce has caught all his master's least pleasant characteristics without showing one tithe of his power. An occasional consciousness of feeling, if not of expression, a habit of using scientific and obscure words: these are peculiarities which we can forgive in the master, but not the pupil. Like "Inconsequent Lives," "Jaco Treloar" deals with the peasantry of the extreme west of Cornwall, and like that story again it is unrelievedly grey in tone. Mr. Pearce calls it "a study of a woman": it is rather a study of two animal natures; and it is not treated with sufficient skill or art to excuse its sordid character. In one thing, however, Mr. Pearce is successful: his Cornish peasantry and peasant scenes are faithful and lifelike. But his style is awkward and tautological; and the note of sex is dwelt upon with quite unnecessary persistence.

SCOTT, SIR WALTER. The Bride of Lammermoor, and Ivanhoe. (A. and C. Black.) 8vo. Cloth. 5s. each.

The latest volumes of the new Dryburgh edition of the Waverley Novels which Messrs. A. and C. Black are publishing at monthly intervals. The illustrations to "The Bride of Lammermoor" are by Mr. John Williamson; those in "Ivanhoe" by Mr. Gordon Browne.

SCOTT, SIR WALTER. Ivanhoe. (J. C. Nimmo.) Two volumes. Crown 8vo. Cloth. 12s.

One naturally turns with special interest to "Ivanhoe" in following the fortunes of the "Border" edition of Scott's novels, and there is by no means any falling away in the interest of the editor's critical introductions or in the excellence of the artistic element in the get-up. The twelve illustrations for "Ivanhoe" were entrusted to one hand; all are both etched and engraved by M. Ad. Lalauze, discriminating care having been taken in the selection of the most dramatic situations in the story for such treatment. The student of Scott is familiar with the circumstances under which "Ivanhoe" made its appearance in 1819—the success with which it was received by the general public, and the family troubles which, to the author, spoiled the effect of the reception of his work. Mr. Andrew Lang enters fully into the severe criticisms of the novel by Mr. Freeman and others, and his appended notes are, as in the case of previous volumes in the same edition, very useful to the reader.

TWAIN, MARK. The \$1,000,000 Bank-Note and Other New Stories. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 310. 3s. 6d.

A collection of nine short stories.

WIGGIN, KATE DOUGLAS. The Story of Patsy. (Gay and Bird.) Crown 8vo. Cloth. 2s. 6d.

A slight story running only to 68 pp., but full of the pathos of slum life in a Western city. The author is at her best when describing the child life of the poor, and "Patsy" is a characteristic creation which is, alas! only too true to life, although so touchingly sad. It was written and sold some years ago for the benefit of a free Kindergarten in San Francisco.

YONGE, CHARLOTTE M. **Grisell Grissell; or, The Lairdly Lady of Whitburn.** (Macmillan.) Two volumes. 21s.

This story, dealing with the Wars of the Roses, is written in Miss Yonge's well-known style, and is admirably suited for young girls and boys. The accident by which little Grisell Dacre has her face incurably scarred and disfigured makes a good starting-point to the tale; and her adventures in different parts of England, where she is everywhere shunned because of her misfortune, prove excellent reading. How she wins over her relations to love her, how she is accused of witchcraft, how she escapes from her persecutors, how she is married against her will to a knight, who afterwards comes to love her, are all very well told.

ZANGWILL, I. **Children of the Ghetto: A Story of a Peculiar People.** (Heinemann.) Crown 8vo. Cloth. Pp. 410. 6s.

The appearance of the third, and popular, edition of his wonderful study of the London Jewry has given Mr. Zangwill an opportunity of restoring its original sub-title and of adding—reluctantly, it seems—a glossary of the "Yiddish" words and phrases which occur throughout the book. Mr. Zangwill is evidently anxious that his work should not be considered as a novel. "It is intended," he says, "as a study through typical figures of a race whose persistence is the most remarkable fact in the history of the world, the faith and morals of which it has so largely moulded."

HISTORY.

CLARKE, H. BUTLER, M.A. **Spanish Literature.** (Swan Sonnenschein.) Crown 8vo. Cloth. Pp. 288. 6s.

Mr. Clarke, the Taylorian Teacher of Spanish at Oxford, intends this elementary handbook as an answer to the question he is so often asked as to what there is to read in Spanish literature besides Cervantes and Calderón. Occasional translated extracts are given from the works of writers mentioned, a list of the cheap and easily obtainable editions of the books best suited for a preliminary course of Spanish reading, and a list of some of the principal writers on Spanish literature for those who wish to continue the study of the subject. The volume is provided with an index.

DUTT, RAMESH CHUNDER. **Ancient India: 2000 B.C.—800 A.D.** (Longmans.) 18mo. Cloth. Pp. 196. 2s. 6d. With two maps.

This volume is the first of a series of Epochs of Indian History.

PRIDEAUX, S. T. **An Historical Sketch of Bookbinding.** (Lawrence and Bullen.) Small 4to. Cloth. Pp. 303. 6s.

An extended reprint of the introduction contributed to the catalogue of the Exhibition of Binders, held at the Burlington Fine Arts Club in 1891. Miss Prideaux does not intend her book as an exhaustive historical treatise, but simply as a help to those interested in the subject, as such information as it contains is only to be found scattered up and down expensive illustrated works. The volume also contains a chapter on "Early Stamped Bindings," by Mr. E. Gordon Duff, an exhaustive bibliography, an index, and, as frontispiece, a colotype reproduction of a binding of St. Cuthbert's Gospel. The beautiful "end-paper" used in the volume is a copy of one made at Nuremberg at the end of the last century.

SNELL, F. J., M.A. **Primer of Italian Literature.** (Clarendon Press, Oxford.) 12mo. Cloth. Pp. 184. 3s. 6d.

A short elementary handbook to the history of Italian literature, forming one of the Clarendon Press Series.

LEGAL, POLITICAL AND PHILOSOPHICAL.

DU CANE, COLONEL SIR EDMUND F. **The Punishment and Prevention of Crime.** (Macmillan.) Crown 8vo. Cloth. Pp. 235. 2s. 6d.

The new volume of the cheap re-issue of the series devoted to the English Citizen: His Rights and Responsibilities.

HOBHOUSE, L. T., M.A. **The Labour Movement.** (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. xii, 98. 3s. 6d.

A volume of the Reformer's Bookshelf Series designed "to state and briefly defend certain principles of economic reform; to show that under many differences of application and detail these principles are common to various industrial movements of the present day; and, accordingly, to argue that the movements in question have a natural basis for a closer alliance with one another, and a reasonable claim on the support of all who desire a remedy for economic ills." It professes to give neither a history of the Labour Movement nor a statistical account of the present industrial position.

MINTO, WILLIAM, M.A. **Logic Inductive and Deductive.** (John Murray.) Crown 8vo. Cloth. Pp. 373. 4s. 6d.

One of the University Extension Manuals completed by Professor Minto a short time before his death. In this book he has attempted to put the study of logical formulae on a historical basis, and to increase the power of logic as a practical discipline. The different chapters embody a large part of his teaching in the philosophical class-room of his University.

MISCELLANEOUS.

School Libraries. (The Schoolmaster, 14, Red Lion Court.) 6d.

This pamphlet, reprinted from the *Schoolmaster*, contains some useful hints upon the formation of a school library—both for boys and girls—and a lengthy, and apparently very complete, list of suitable books.

BROWN, JAMES D. **A Handbook of Library Appliances.** (David Stutt.) Paper covers. Pp. 56. 1s.

A handbook dealing with the technical equipment of libraries from fittings and furniture to recipes for paste, etc.

THOYTS, E. E. **How to Decipher and Study Old Documents: being a Guide to the Reading of Ancient Manuscripts.** (Elliot Stock.) Crown 8vo. Cloth. Pp. 143. 4s. 6d.

With an Introduction by Mr. C. Trice Martin, Assistant-Keeper of Her Majesty's Records.

The Amateur Photographer's Annual, 1893. (Hazell, Watson and Viney.) 8vo. Cloth. Pp. 216. 2s.

Contains a complete guide to carbon printing, practical articles, and a holiday guide to the leading photographic haunts in the Empire. It is illustrated with one carbon print and thirteen collotypes.

What to Read: Fabian Tract, No. 29. (Fabian Society, 276, Strand.) Pp. 32. 3d.

A valuable list of books on economic problems for all interested in the study of social questions.

WILSON, EDWARD L. (Editor.) **Photographic Mosaics: an Annual Record of Photographic Progress.** (Gay and Bird.) Paper covers. Pp. 282. 2s. 6d. net. Illustrated.

This is an American work, and it is interesting to note from its illustrations that the best American "half-tone" reproductions are much inferior to the best English. The articles upon different technical subjects contributed by the editor and various specialists will be of the greatest value to photographers.

POETRY, MUSIC AND THE DRAMA.

BEATTY, PAKENHAM. **Sprete Carmina Musæ.** (George Bell and Sons.) Fcap. 8vo. Cloth. Pp. 140. 4s. 6d. net.

There are many pieces among these "songs of a despoiled muse" above the average of minor verse, but Mr. Beatty is unable to remain at the high level that he occasionally reaches. It is not so much that his verses are facile, as that they are laboured and unequal, and sometimes rough and unmusical. One or two of the sonnets are successful, and some of the dramatic fragments are dramatic; but Mr. Beatty is at his best in his dedication to Robert Browning, and in the section entitled "Pilgrimage." "The Wreck of the *Birkenhead*," too, is a striking piece of verse which might well be applied to a more recent calamity—the loss of the *Victoria*.

DE GRUCHY, AUGUSTA. **Under the Hawthorn.** (Elkin Mathews and John Lane.) Crown 8vo. Cloth. Pp. 85. 5s. net.

A very pleasing collection of minor verse. The title-page is from a design by Mr. Walter Crane.

ELLIS, HAVELOCK (Editor). **The Best Plays of Christopher Marlowe.** (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. xlvii, 430. 2s. 6d. New Edition.

A volume of the Mermad Series of the Old Dramatists, containing, in addition to Mr. Havelock Ellis's critical essay upon Marlowe, a general introduction to the series by the late Mr. J. Addington Symonds in the shape of an essay on "The English Drama during the Reigns of Elizabeth and James I.," and an etched portrait of Edward Alleyn from the picture in Dulwich College. The plays printed are "Tamburlaine the Great," "Dr. Faustus," "The Jew of Malta," and "Edward the Second."

EYRE-TODD, GEORGE. **Scottish Ballad Poetry.** (William Hodge and Co., Glasgow.) Crown 8vo. Cloth. Pp. 323. 5s.

A volume of the Abbotsford Series of the Scottish Poets, which attempts to furnish, in authentic form, a collection of what is finest in the ballad poetry of Scotland. There is no index of authors, but the chronological order has been retained as far as possible, and the editor, besides contributing a lengthy introduction, writes a brief bibliographical note to each ballad.

Golden Treasury Psalter. (Macmillan.) 2s. 6d. net. Pp. 266.

The first edition appeared in 1870; it was re-issued in 1871, and now a third edition is called for. It still bears on its title-page the information that it is an abridgment of "the Psalms chronologically arranged" by "Four Friends." The identity of the "Four Friends" has only within the last few weeks been disclosed. The gentlemen who thus concealed their identity were Mr. F. E. Kitchener, formerly headmaster of Newcastle-under-Lyme School, now of Stone, Staffordshire; Dr. A. W. Potts, of Edinburgh, now deceased; Mr. J. S. Philpotts, of Bedford School; and Mr. M. Arnold (not Matthew) also deceased.

HOUSMAN, LAURENCE (Editor). **Selections from the Writings of William Blake.** (Kegan Paul.) 12mo. Parchment. Pp. xxxi, 259. 6s.

A volume of the well-known Parchment Library, whose beautiful format, even in these days of dainty books, no publisher has been able to excel. Mr. Housman is an illustrator thoroughly steeped in the traditions of Blake's art, and is by sympathy and knowledge admirably qualified to prepare this selection from the writings, both in prose and verse, of the poet whose work formed the subject of an article in a recent number of this Review. His introductory essay is an excellent piece of work. A reproduction of one of Blake's most characteristic designs forms the frontispiece of the volume.

IBSEN, HENRIK. *The Master Builder.* (Heinemann.) Paper covers. 1s.

This is more than a popular edition of Ibsen's latest drama, for it contains a biographical and theatrical note by Mr. Edmund Gosse, and "An Appendix for Critics" in the shape of an open letter by Mr. William Archer to his friend, Mr. A. B. Walkley, the dramatic critic of the *Speaker* and of the *Star*. In his criticisms upon the play, and in an article in the *Fortnightly*, Mr. Walkley had protested his inability to conquer the "true inwardness," the symbolic intention, of the play; and in his letter—extending over nearly thirty pages—Mr. Archer endeavours to make clear the fact that "the melody, the plot" of the play, apart from its symbolism, is in no way obscure, and that Mr. Walkley's objections and criticisms are rather the result of an undue desire to find out an inner meaning, when, after all, an inner meaning is not altogether necessary to its enjoyment, than to any inherent defect in Ibsen's treatment of his theme.

NICHOLSON, BRINSLEY, M.D. (Editor). *The Best Plays of Ben Jonson.* Volume I. (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. lxxii., 382. 2s. 6d.

A volume of the Mermaid Series of the Old Dramatists. For some time this series has been out of print, but Mr. Fisher Unwin has now arranged for its publication, and the present is the first of three volumes which are to be devoted to Ben Jonson. It contains three plays: "Every Man in his Humour," "Every Man out of his Humour," and "The Poetaster." The critical introduction is by Mr. C. H. Herford, and a portrait of the poet appears as frontispiece.

Selections from the Poems of Walter C. Smith. (Maclehose, Glasgow.) Crown 8vo. Cloth. Pp. 175. 3s. 6d.

The author of "Olrig Grange" has, in this country at least, never achieved his due popularity; and it is to be hoped that this selection from books that he has already published will help to make his work more widely known. He is a poet of unusual versatility: his songs have the true lyric grace, his "character sketches" and "dramatic fragments" are admirably conceived and executed, and in every poem that he has written there is a depth of thought, combined with a fitness and picturesqueness of phrase, which make this collection unusually interesting. Among modern minor poets Mr. Smith has certainly no mean place.

SHEEDLOCK, J. S. (Editor). *The Beethoven-Cramer Studies.* (Augener.) 2s. 6d.

Forty-one studies for the pianoforte, by J. B. Cramer, with comments by Beethoven, and preface, explanatory notes, etc., by Mr. Sheedlock. It is a volume for which students and teachers will be grateful, Beethoven's terse comments on each study having been translated into English, while all other marks by Beethoven are carefully reproduced.

STATHAM, H. HEATHCOTE. *Form and Design in Music.* (Chapman and Hall.) Cloth. Pp. 114. 2s. 6d.

This outline of the æsthetic conditions of music and musical composition formed originally the first chapter of the author's "My Thoughts on Music and Musicians." In its present form it has been revised, and some additional information has been added.

SHAW, G. BERNARD. *Widowers' Houses.* (Henry and Co.) Crown 8vo. Cloth. Pp. xxiv., 126. 2s. 6d. net.

The first of the Independent Theatre Series of Plays which Mr. J. T. Grein, the president of the Independent Theatre Society, proposes to edit. No recent English play has excited so much attention as "Widowers' Houses," and however it may have been acted, it at least makes amusing reading. Mr. Shaw's preface, in which he criticises his critics, and his appendices, in which he reprints various letters which he wrote to the papers after the appearance of the play, are very interesting, and go to prove in what a perilous state is the average dramatic criticism of the present day. Mr. Grein's short general introduction to the series is somewhat fatuous and ill-written.

SCIENCE.

BURNETT, J. COMPTON, M.D. *Curability of Tumours by Medicines.* (Homœopathic Publishing Co.) Fcap. 8vo. Cloth. Pp. 332. 3s. 6d.

Mr. Burnett is a consistent opponent of the practice of removing tumours by operation, believing that in the majority of cases it may be avoided by medical treatment. He includes cancer under the heading of tumours, but he intends treating of that malady in a separate work.

Fournet, 1892. (Fournet, 18, Bentinck Street.) Folio. 42s.

M. Fournet is a French oculist who has settled in London. His original ideas upon his science have led him to publish this volume, in which, in a manner hardly to be understood of laymen, he makes some astonishing attacks upon the methods of treatment prescribed by well-known eye specialists: Mr. Critchett, Mr. Brudenell-Carter, Mr. Nettleship, Mr. Comper, Dr. Quarry Silcock and Mr. Lawson. The size of the volume is explained by the fact that M. Fournet has reproduced in facsimile a number of letters, prescriptions, and other documents.

GALTON, FRANCIS, F.R.S. *Decipherment of Blurred Finger Prints.* (Macmillan.) 8vo. Cloth. 2s. 6d. net.

A supplementary chapter to Mr. Galton's "Finger Prints" in which he discusses the objections that have been raised to this method of criminal registration, on the ground that ordinary officials would fail to take the prints with sufficient sharpness, and that no jury would convict on finger-print evidence. A number of plates are given, showing examples of different prints enlarged by photography.

THEOLOGICAL.

GARNIER, JOHN. *Sin and Redemption; or, The Spirit and Principle of the Cross of Christ.* (Elliot Stock.) Crown 8vo. Cloth. Pp. 508. 9s.

This work is written from a Christian standpoint, and is addressed principally to believers in Christianity. Some, however, of the arguments recently taken by opponents of Christianity are discussed.

GLADDEN, WASHINGTON. *Tools and the Man: Property and Industry under the Christian Law.* (James Clarke and Co.) Crown 8vo. Cloth. Pp. 308.

The substance of a course of lectures delivered to the students of the New Haven Theological Seminary, and portions of which have also been delivered at Cornell University and at Mansfield College, Oxford. Mr. Gladden believes that the Christian law, when rightly interpreted, contains the solution of the social problem, and that Christianity not only holds up a beautiful ideal, but that it presents the only theory of industrial and social order that can be made to work.

Meditations and Devotions of the late Cardinal Newman. (Longmans.) Long Crown 8vo. Cloth. Pp. 611. 5s. net.

These papers were likely, most of them, to have formed part of a "Year-Book of Devotion" for reading and meditation according to the seasons and feasts of the year, which Cardinal Newman had for many years intended to compile, but which many circumstances prevented his finishing.

VOYSEY, REV. CHARLES, B.A. *The Sling and the Stone.* Volume X. (Williams and Norgate.) 8vo. Cloth. Pp. 440. 10s. 6d.

This volume is divided into four sections: (a) Revelation Tested on Moral Grounds; (b) The Bible and Modern Criticism; (c) On the Book entitled "Lux Mundi"; (d) The Voice of God.

TRAVEL, GEOGRAPHY, AND TOPOGRAPHY.

BARTHOLOMEW, J. G., F.R.G.S. *The Tourist's Atlas-Guide to the Continent of Europe.* (George Philip and Son.) Crown 8vo. Cloth. 168 Maps. 5s.

A series of admirably clear section maps and plans, with brief notes for travellers as to hotels, railway stations, restaurants, etc. The plans of the different towns will be found particularly useful.

BARRETT, C. R. B. *Illustrated Guides to the Eastern Counties.* (Lawrence and Bullen.) Paper covers. 6d. each.

The third, fourth, and fifth volumes of this excellent series. No. 3 deals with St. Oysth, Wivenhoe, Fingringhoe, and Brightlingsea; No. 4 with Southend and its surroundings; No. 5 with Ipswich, and the routes from Ipswich to Harwich and Felixstowe.

BELL, NANCY. *The Tourist's Art Guide to Europe.* (George Philip and Son.) Fcap. 8vo. Cloth. Pp. 328. 5s.

A handbook, very excellently illustrated, to the art treasures of every important town on the Continent. Good indices add greatly to the volume's usefulness.

HOWARD, B. DOUGLAS, M.A. *Life with Trans-Siberian Savages.* (Longmans.) Crown 8vo. Cloth. Pp. 209. 6s.

This is a result of an intimate study made by Mr. Howard of the natives of the Island of Saghalien, the ultimate penal colony to which are now sent all the most dangerous of the Russian exiles. He considers these natives to be "the most ancient, distant and least known savages surviving in Asia," and the value of his researches can be understood when it is said that for nearly three hundred years no other observer has written upon the subject. Mr. Howard was specially lucky in the conditions under which he worked, for he lived in Saghalien as the guest of the governor, who gave him every opportunity and facility for observation.

INGLIS, H. R. G. *The Great North Road Map.* (Gall and Inglis.) 18mo. Cloth. 2s.

A very handy and distinct map of the road between London and Edinburgh, arranged in an ingenious manner which allows of an unusual amount of detail. When opened to its full length, the map is some yards in length.

MILES, E. J., M.D. *Byways in the Southern Alps.* (H. K. Lewis.) 8vo. Boards. Pp. 120.

Illustrated sketches of spring and summer resorts in Italy and Switzerland.

WHARTON, CAPTAIN W. J. L., R.N., F.R.S. (Editor). *Captain Cook's Journal during his First Voyage Round the World made in H.M. Bark "Endeavour," 1768-1771.* (Elliot Stock.) 4to. Cloth. Pp. lvi., 400. 21s.

Oddly enough this is the first volume to contain, entire and untouched, the original journal kept by Captain Cook upon the earliest of his voyages; for Dr. Hawkesworth, in whose hands, upon the return of the bark, was placed the task of preparing the account of the voyage, decided that it would be better to compile it from the journals of Captain Cook, Mr. Banks, Dr. Solander and others; the result being a jumble of facts somewhat unsatisfactory to the modern reader, anxious, not unnaturally, to get as clear an idea as possible not only of the voyage itself but also of the great mariner who made it. Now the Journal has been literally transcribed from the original manuscript, its interest and value being enhanced by the addition by Captain Wharton of a memoir of Captain Cook's life, and a number of notes. A portrait appears as frontispiece.

CONTENTS OF REVIEWS AND MAGAZINES.

ENGLISH AND AMERICAN.

Amateur Work.—Ward, Lock, Salisbury Square. July. 6d.

Scene-Painting for Amateurs. Illustrated. H. L. Benwell.

The Spectroscope: How to Construct It. Illustrated. O. Beckerlegge.

American Journal of Politics.—114, Nassau Street, New York. June. 35 cents.

White Supremacy in the South—How Perpetuated without Violation of Law. J. H. Pitman.

The Immigration Question in Congress. Richard H. Sylvester.

Woman's Sphere not in Politics. Wm. W. Phelps.

The Woman of To-day as Wife and Mother. Mrs. Mabel Cronise Jones.

The Danger of the Hour: Luxury and Extreme Poverty.

Money and Civilization. G. S. Kimball.

Patriotism, Morality, and Pensions. Allen R. Foote.

Drunkenness and the Remedy. Leslie E. Keeley.

Andover Review.—Gay and Bird, 27, King William Street, Strand. June. 2s.

Switzerland as a Nursery of Politics. Joseph King.

Primary Qualifications for the Ministry. Rev. D. N. Beach.

The Ethics of Confucius, as Seen in Japan. Rev. J. H. De Forest.

Wealth. Rev. Dr. A. P. Peabody.

The Double Advantage of the Modern Preacher.

Archæological Notes. Prof. Taylor.

Anglo-Continental.—16, Tokenhouse Yard, Lothbury, E.C. June. 6d.

German Dialects in Tyrol and Vorarlberg.

Peter Pindar. R. Murray Gilchrist.

Antiquary.—Elliot Stock. July. 1s.

The Proposed Demolition of a Part of Sheriff-Hutton Castle. Illustrated.

Researches in Crete. Illustrated. Prof. F. Halbherr.

Notes on Archæology in Ilkley Museum. Illustrated. Roach Le Schoenitz.

Gatesborough during the Great Civil War, 1642-1648. Edward Peacock.

Arena.—Brentano. June. 2s. 6d.

Insanity and Genius. Arthur McDonald.

The Liberal Churches and Scepticism. M. D. Shutter.

Women Wage-Earners. VI. Helen Campbell.

MR. GEO. THOS. CONGREVE'S TREATMENT.

CASE OF "HOPELESS PHTHISIS"

BROUGHT HOME TO DIE!

BUT CURED! BY THE TREATMENT OF
Mr. GEO. THOS. CONGREVE.

"DEAR SIR,—I have much pleasure in writing you to say that one of my sons, *whose life was despaired of* in consequence of Consumption having supervened an attack of inflammation of the lungs, *has been completely restored to health* by your invaluable treatment. I cannot speak too highly of your medicine, for a more complete and wonderful cure, I think, has never been effected by any other medicine. My son returned home in a hopelessly dying state. By accident I heard of your remedy, and determined to try it. My wife and other members of my family were surprised and delighted to notice some change for the better, after a few days only; and in a few months, I am glad to say, my son was entirely restored to health, and is now one of the strongest and most robust of our family.

"As the publication of this case would, I think, do much good, you can make any use you like of this letter, &c. I shall write an account to my relatives living in Tasmania and Queensland, and should suggest your inserting this in the papers there.—I am, dear Sir, yours gratefully, JOHN B. HARDWICK, Selby Villas, Prettlewell Street, Southend, Essex."

In confirmation of the above, Mr. Hardwicke has sent me the certificate of his son's discharge from the Royal Navy: "*Sydney Hardwicke invalided; case, Pneumonic Phthisis.*" Also a certificate as to his present state of health from a surgeon at Southend:—"I hereby certify that *Sydney Hardwicke is sound in body and of good constitution.*"—9th August, 1892.

**THE MOST SUCCESSFUL TREATMENT IN THE WORLD FOR
CONSUMPTION, AND ALL CHEST DISEASES, AND RESULTS OF INFLUENZA.**

Read Mr. CONGREVE'S Book "ON CONSUMPTION, ETC.," which may be had, post free for ONE SHILLING, from the Author, Coombe Lodge, Peckham, London, S.E.

FOR THE

RADICAL CURE OF RUPTURE

IS A

Certain Remedy.

EXTRACTS FROM TESTIMONIALS.

Dr. ALLINSON, L.R.C.P., 4, Spanish Place, Manchester Square, writes, in reply to an inquiry in the *Weekly Times and Echo*, of September 3rd:—"To not be operated on for your rupture, but wear one of Atkinson's Patent Trusses for a time."

"I have for over fifteen years worn trusses of many kinds, but my rupture got gradually worse, until Dr. Allinson advised a trial of yours, since which time I have had no trouble, and am now cured."—ALFRED LOVE, Esq., 6, The Broadway, Wimbledon.

"I have had no return of the rupture since wearing your truss."—S. MARCHANT, Esq., 21, St. Thomas Road, South Hackney.

"Since wearing your truss there has been no appearance of the hernia."—T. CHIPPERFIELD, Esq., 8, Newgate Street, E.C.

THE PROGRESS OF THE WORLD.

LONDON, August 1, 1893.

**The Asiatic
Artichoke.**

Europe continues to devour the Asiatic artichoke—a leaf at a time. This time it is Siam that has suffered, and France that has gained. Gradually the Asiatic area under Asiatic government dwindles, and outside China and Arabia there will be little left for the twentieth century to transfer to the Western flags. Already Persia is virtually a satrapy of the Tzar. The ferment in Armenia is preparing the way for the extension of Russian authority to the Euphrates. In Afghanistan, the Ameer preserves a precarious independence between the Muscovites—who will one day rule in Herat and in Balkh—and the British, whose outposts will, in spite of ourselves, be pushed forward to Cabul and Candahar. We have annexed Burmah, France has begun to annex Siam. Arabia and China, regions from which Europe has been submerged by devastating tides of armed invasion, seem destined to be the sole surviving regions of Asia governed by Asiatics.

**The French
Attack
on Siam.**

It is difficult to say exactly why the French should have chosen the present time of all others for pushing forward their frontier in the Far East. Circumstances appear to have precipitated their action, but the decision was probably taken long ago. There is only one way to save Siam from becoming a French possession, and that is to make it British. We may talk as we please about Siamese independence being a British interest. A power that capitulates before three gunboats cannot be independent. If we do not intend to see the tricolour flying over Bangkok we shall have to anticipate it with the Union Jack. We may postpone the inevitable by temporising expedients, but ultimately there will be no escape from this alternative. At present we may probably find that it will be sufficient to establish some arrangement with the King of Siam which will enable us to regard Siam as we regard Afghanistan—a protected State in fact although not in name. We

are immeasurably stronger than the French in the Indian Ocean, and Bangkok is much easier of access than Cabul. France has practically no trade with Siam, from 80 to 90 per cent. of whose foreign trade is conducted with the British Empire. Siam buys two and a half millions worth of goods per annum from British markets. It might suit France to handicap our traders by a prohibitive tariff for the benefit of her own subjects, and it would be well not to lead her into that temptation.

**British
Interests in
Siam.**

There is no question of establishing a British protectorate over Siam, at present, although the matter might be mooted at any moment. Lord Rosebery in the House of Lords, on July 27, thus described British interests in Siam:—

M. PAVIE.

(From a photograph by M. Comret, of Paris.)

We have, in the first place, great commercial interests in that country, and British shipping constitutes eighty-seven per cent. of the whole shipping in Bangkok in point of tonnage, and ninety-three in point of value. Moreover, the territorial arrangements consequent on this dispute involve matters of British concern. Her Majesty's Government are glad to believe that the French Government are not less alive than themselves to the value of Siamese independence, and that they regard it as a matter of moment, both to France and to ourselves, that we should nowhere have conterminous frontiers in the Indo-Chinese Peninsula, for such a frontier would

involve both States in great military expenditure and cause liability to panic.

Unfortunately, the French Government has practically made our frontiers conterminous by insisting upon the cession of the Siamese territory between the 18th and 23rd degree on the Mekong.

**The French
Ultimatum.**

The French had some frontier quarrels with the Siamese, out of which they had no more difficulty in manufacturing a *casus belli* with Siam than we found in manufacturing similar pretexts for making wars in Afghanistan or in Burmah. Finding the Siamese Government indisposed to come to terms, two French gunboats forced their way up on the Menam, under shell fire from the Siamese forts, which they returned with interest; and then, having killed and wounded ten times as

many Siamese as their own loss, they demanded reparation in an ultimatum which embodied the following terms:—

"(1) Recognition of the rights of Annam and Cambodia to left bank of River Mekong and the islands; (2) evacuation of the posts there held by the Siamese within one month's time; (3) satisfaction for the various aggressions against French subjects in Siam, and French ships and sailors in Menam; (4) punishment of the culprits and pecuniary indemnities to the families of victims; (5) indemnities of two million francs for various damages inflicted on French subjects; (6) immediate deposit of three million francs in dollars as guarantee for claims of Nos. 4 and 5, or in default of guarantee farmers and taxes of Battambang and Siem Reap. Should these terms not be accepted the French Minister will leave, and the coast be forthwith blockaded."

The Siamese Government offered to concede most of these points, limiting the territorial cession to the eighteenth degree. The French refused to accept this modification of their demands, and the blockade began.

The Siamese Surrender.

In their hour of despair the Siamese looked to England for help, and looked in vain. Lord Rosebery sent some gunboats to the seat of

war, to protect British subjects, some 200 of whom are living amid the 350,000 Orientals of Bangkok; but he was careful to explain that this action was not intended as an encouragement to the Siamese to persevere in a hopeless resistance. In reply to their request for advice, Lord Rosebery urged them to come to terms as quickly as possible with their powerful neighbour. The Siamese, seeing that no help was forthcoming from without, surrendered at discretion. By doing so they extricated themselves from one difficulty and

landed us in another. For by the cession of the territory on the left bank of the River Mekong, north of the eighteenth degree, they handed over to France a portion of the Burmese state of Kyang Kheng, which, when we were rearranging our frontiers, we handed over to the Siamese last year, on the express understanding that they would not surrender it to any other power. It is possible that Lord Dufferin may arrange this matter, as there is no difficulty in showing that Annam and Cambodia have no rights

over the Burmese State of Kyang Kheng, which Siam only held in trust for us. But the French are flushed by their easy victory, and already voice is heard in the Parisian press complaining of the moderation of the Ministry. Since they need only ask to have, the Chauvinists naturally complain because their Ministers did not ask for the keys of Bangkok on a silver salver.

The Moral of it all. The French are doing as we have often done. We don't like it any more than they liked our doings; but that is no reason why we should call them names. We have

got to make the best of it, and to make up our minds whether or not it is worth forestalling the French when the question is not the left bank of the Mekong, but the ownership of Bangkok. We shall struggle, and rightly struggle, to maintain the buffer state as long as we can, but buffers wear out, and we may as well make up our minds that if Bangkok is not British it will be French. The term of grace during which we were isolated in India is rapidly drawing to a close. Our great dependency is being approached from North-West and South-East, and

CHULALONGKORN I., KING OF SIAM.

the menace of the French advance will be very useful if it cools down the fever of Russophobia. For we shall find that so far as we are concerned it is a thousandfold more easy to get on with the Autocrat of all the Russias than it is with the Republic of France. For the Tzar has at least the responsibilities of his position, whereas the Republic practically means a temporary congeries of political ephemera driven hither and thither by the stinging clouds of journalistic gnats which swarm on the Parisian press. The French encroachment upon Siam will not have been in vain if it reminds our public men that France, and France alone, is the secular rival of Britain.

What will China say?

England acquiesces in the dismemberment of Siam. But China is less likely to be quiescent. Siam is a Chinese tributary state. The territory ceded to France is at Pekin believed to be part and parcel of the possessions of the Emperor of China. The Mandarins do not love the French. They bear them many a grudge about Tonkin and the subsequent hostilities in Chinese waters. But although the Chinese may protest, they are not likely to attack. They will make what trouble they can for the intruding Frank, they will refuse to recognise the treaty extorted by blockade, but they will not go to war. Another argument, however, will be added to the store of those who plead for an Anglo-Chinese alliance as the best security for the peace of Asia. In any case, Lord Rosebery is likely to have his hands full

for some time to come at the Foreign Office, and it is well he has so admirable and trustworthy a representative in the House of Commons as Sir Edward Grey.

The shrinkage of the world is making itself somewhat disagreeably felt in the East on the West. two plagues of the closing century—the Currency and the Cholera. Of the two the currency

is much the more serious. Last month the Indian Government closed the Indian mints, and by a stroke of the pen converted the whole silver coinage of India into mere token money, the rupee having a token value of sixteen-pence. The direct and immediate result of taking this step at Calcutta has been to throw Colorado into temporary bankruptcy, and to compel President Cleveland to summon Congress to meet in August, in order to deal at once with the silver crisis. All the silver mines of Colorado are closed, 30,000 miners are thrown out of work, and the Governor of the State is summoning

THE QUEEN OF SIAM.

a special session of the State legislature in order to suspend the payment of all debts for two years. The prevailing demoralisation was aptly illustrated by the boarding of a freight train by 400 miners out of work, who emptied out the goods and compelled the drivers, on threat of death, to carry them Eastward, free gratis and for nothing. Of course India will reply that she is not to blame, as Colorado began it by producing silver in excess of the world's needs; but my point is not who is to blame, but merely the close connection

LI HUNG CHANG.

between East and West, a connection which tends to become closer every year.

The old Crusaders, who regarded the **Sanitation and Religion.** Paynim as the enemy of God and man, would have heard with grim satisfaction of the news of the outbreak of cholera at Mecca. It would have seemed to them a divine visitation, and they would have regarded it as nothing less than providential that the infidels should be poisoned by the observance of the most sacred rites of their religion. The well Zem Zem, the sacred fountain which, according to tradition, gushed up in the desert to assuage the thirst of Hagar and Ishmael, is a seething mass of microbes and water. Yet every pilgrim to the sacred sites has to drink as much of it

as he can, while a bucketful of the poisonous filth is being poured over his head. The water runs down the pilgrim's person, saturating his filthy rags, and then drains down into the well once more, carrying with it whatever choleraic and other microbes it may have encountered *en route*. These body-drippings, drained back into the well, are served up again and again to each successive pilgrim, until the wonder is not that the cholera kills many, but that it spares any. But what can be done? To close Zem Zem would narrow the portals of paradise for the True Believer. It is very sad that Moslems should thus make religion a great cholera propagator, but it is on the whole less contemptible than the conduct of that American congregation which, from its slavish dread of infection, has this year substituted for the communion cup which passed from lip to lip an arrangement by which each communicant is supplied with a separate wine-glass for his own exclusive use.

For the first time since **First Blood in Rhodesia** was occupied **Matabeleland.**

there has been bloodshed on the frontier. An impi of Lobengula's braves made a raid upon Mashonaland and levied war in their customary fashion, burning kraals and massacring the Masho-

nas, whom they used to harry like sheep from a fold. But this time they reckoned without their host. Dr. Jameson, the Administrator of the Chartered Company, got together a small but efficient force of mounted police, and summoned the Matabele to return to the other side of the demarcation line. This they refused to do. Whereupon the handful of police—thirty-eight all told—opened fire upon them, and charging down upon the impi drove the marauders back to their own territory, with a loss of thirty men. It is but a small affair, no doubt, but it is first blood. Every one knew that the Chartered Company must sooner or later come to collision with the Matabele, but we all hoped it would be later rather than sooner. Mr. Rhodes, of course, will do his utmost

to square Lobengula, for the Dictator prefers ever to use gold rather than steel, and it may be that the impi marched without orders or against Lobengula's wish. If so, the storm may blow over. But there will be some hard fighting to be done before the Matabele realise that Civilisation has really clapped handcuffs upon Barbarism as far north as the Zambesi, and all such frontier scimmages remind us that the final trial of strength may not be far distant.

**The East
African
Company.**

The Chartered Company experiment, which has painted the African map red on the Niger, and earned a dividend of $7\frac{1}{2}$ per cent., and which has secured British supremacy as far as the Shire highlands on Lake Nyassa, seems to have broken down rather badly in East Africa. The British East African Company, which served a useful purpose as a stopgap, now wants to be bought out. Price £180,000. It cleared out of Uganda some months since; it has now discovered that it must clear out of Witu. The fact is, that the company cannot make the government of the back country pay. It can probably scramble along, with more or less difficulty, if it is allowed to keep to the coast line and let the interior fend for itself. To this Lord Rosebery objects. The company was chartered to inaugurate a new era, not to intercept for the benefit of its shareholders the natural sources of revenue. The work was beyond its strength. Even a millionaire would have found it difficult, and the British African Company has never had a million to call its own. As the rage for appropriating Africa has somewhat abated, it is possible no one will "jump" the claim which the East African Company is abandoning. But it is risky business, and the French priests are near enough to render a French Protectorate as possible in Eastern Africa as in Eastern Asia.

**The Loss of
the Victoria.**

France seems to be recovering from the cold fit which followed the reaction against the Tonkin Campaign. M. Decrais has at last been appointed as ambassador in London, and he is only too likely to be tempted to "bring pressure" to bear upon Mr. Gladstone in order to gain points real or imaginary which may be used as electioneering capital in France. This being so, it is more than ever to be regretted that the *Victoria* is eighty fathoms deep off the Syrian coast. This is not a time when we can afford to lose million pounder ironclads, which cannot be replaced in less than two years at the lowest. A new vessel, the *Magnificent*, the most powerful fighting-ship in the world, is being pushed forward. She is to cost £960,000, but she will not be commissioned for

years. We must e'en do the best we can with what we have got, and by naval manœuvres and constant evolutions accustom our seamen to sail their ships without running them ashore like the *Howe* or ramming them like the *Victoria*.

**The Verdict
of the Court
Martial.**

The Court Martial on the loss of the *Victoria* brought out very clearly the fact that the catastrophe was entirely due to Sir George Tryon's mistake in ordering the ships to turn inwards when at a distance of six cables, when eight cables was the shortest distance at which such a manœuvre could have been safely attempted. Admiral Hornby, whose paper I notice elsewhere, is certain that Admiral Tryon must have been temporarily off his head with fever before ordering such an evolution; but Admiral Colomb, in a remarkable letter published July 31 in the *Times*, asserts that Admiral Tryon was accustomed to manœuvre his flagship in almost entire disregard of

From a photograph.

[by Elliott and Fry.]

SIR EDWARD GREY, M.P.

the other ships of his fleet, scouted mathematical considerations, and acted generally on the rule of thumb. Admiral Tryon, according to Admiral Colomb, regarded his ship as a rider regards his hunter, and acted accordingly with a strong and frequently expressed impatience of all mathematical calculations and mechanical certainties. He was, moreover, of an imperious disposition, and a stern disciplinarian. All his officers believed in his genius, and feared to oppose his will. Hence, when the signal was made, which was as certain to produce a collision as two and two are to produce four, Admiral Markham had such confidence in his commander that he obeyed orders, feeling sure Admiral Tryon would

manage somehow to avoid the apparently inevitable consequences of his own order.

Obedience at all Costs. The Court, while feeling strong regret that the Commander of the *Camperdown* did not carry out his first intention to semaphore his doubt as to the signal, declares that it would be fatal to the best interests of the Service to say he was to blame for carrying out the directions of his Commander-in-Chief present in person. This is a notable utterance, coming as it does on the top of Admiral Tryon's memorandum, in which he expressly laid down the duty of disobeying orders when they were manifestly fatal. At the same time there is a general concurrence in the finding of the Court. You cannot manœuvre a fleet on the principle of limited liability or qualified obedience. Nelsons, no doubt, may now and then take the law into their own hands at the risk of their career. But as a general standing rule, for the guidance and governance of ordinary men who are not Nelsons, the strict law of obedience is the best.

Faithful unto death. The evidence at the Court Martial brought out into clear relief the excellence of the discipline maintained on board the *Victoria*. As Captain Bourke remarked, it only needed two or three men to cause a panic, but these two or three were not to be found on board. There was absolutely no panic, no shouting, no rushing aimlessly about. The men fell in as upon parade. Those at work on the forecastle worked with a will, till the water was up to their waists. Those below stood to their posts to a man. "When the men were turned about to face the ship's side it must have passed through the minds of many that to look out for one's self would be the best thing to do. . . . I can hear of not one single instance of any man rushing to the side." From the Admiral to the youngest midy, they showed that spirit of trust and bravery which is the glory of the service. The chaplain, whose last words were, "Steady, men, steady," was worthy of his flock. In so large a company there must have been many men of but indifferent character, of comparatively low morale. The fact that the whole of them, without a single exception, stood the death test is a matter of which we as a nation do well to be proud. The splendid response which brought £50,000 to the Lord Mayor's Fund for the widow and the orphan was the national recognition of the heroism of those who stood to their posts unmoved when the *Victoria* took her last plunge to the bottom.

A Hint for the Faithful Commons. As good luck would have it, the British public was furnished with the detailed reports of the way in which our blue-

jackets and their officers faced the supreme crisis, immediately before it was confronted by an illustration of the way in which its elected representatives at Westminster failed in their duty. If the conduct of the officers and men on board the doomed ironclad filled us all with pride, the conduct of the House of Commons covered us with shame. The free fight on the floor of the House which marked the final closing of the Committee stage of the Home Rule Bill can be considered apart from the question of Home Rule, just as the conduct of the crew of the *Victoria* can be considered apart from the question of Admiral Tryon's fatal mistake. The faithful Commons, who, by the bye, muster almost exactly as strong as the crew of the lost ironclad, displayed none of the sterling qualities of their humbler fellow-countrymen. Under comparatively trivial provocation, they lost all control over themselves, and for the first time in history a free fight took place on what used to be regarded as the sacred arena of the House. The story is so suggestive that it is worth going over it if only to illustrate how things should not be done.

How not to do it.

At the time fixed by the House for the close of the discussion on the Home Rule Bill, Mr. Chamberlain was speaking with his usual incisive vigour. As the clock drew near the stroke of ten, he remarked that the slavish adulation which Mr. Gladstone received from his followers had not been paralleled since the sycophants of Herod declared "It is the voice of a God." Thereupon the further delivery of his speech was suspended by loud cries of "Judas, Judas, Judas," first raised by Mr. T. P. O'Connor, but immediately echoed by forty or fifty other members. The whole House rang with the word, the only person who did not hear it being Mr. Mellor, the Chairman of Committee, who placidly closed the debate and called the division. Then Mr. Gibbs, a Conservative member, amid a babel of voices, attempted to call the Chairman's attention to the fact that Mr. T. P. O'Connor had called Mr. Chamberlain Judas. Mr. Mellor, deaf once more, allowed the hubbub to go on while the House was clearing for a division, until at last Mr. Logan, a Gladstonian member, crossed the floor of the House and stood close to the front Opposition Bench in order to ascertain, if possible, what it was that Mr. Gibbs was saying. A rude interchange of words followed, and Mr. Logan, in order to put himself in order, committed inadvertently the parliamentary *faux pas* of sitting down for a moment on the front Opposition Bench. Thereupon the prevailing excitement and

anarchy culminated in an act of open violence. The authority of the Chair being virtually non-existent, Mr. Hayes Fisher, a young Tory member, seized Mr. Logan by the neck, and with the assistance of Sir Ashmead Bartlett forcibly ejected him on to the floor of the House. This, in Mr. Fisher's own words, was the signal for a general scrimmage. For several minutes a disgraceful row raged on the floor of the House. A mob of some fifty or sixty members scuffled with each other; a coat was torn; some heavy blows, audible above the din, were dealt on the faces of some of the combatants; a book-shelf was smashed. No one knows to what dimensions the fracas might have grown, when fortunately the strangers in the gallery loudly hissed the disorderly crowd below, the Chairman at last took down the word "Judas" complained of by Mr. Gibbs, the Speaker returned, and order was restored.

If it had
been in the
Navy.

This scandalous scene occurred at Westminster, and no one has been punished. If anything equivalent to such a disgraceful scene had taken place in the Navy, Mr. Mellor would have been tried by court martial and dismissed, and Mr. Hayes Fisher and Sir Ashmead Bartlett would have been placed under arrest. For undoubtably the *causa causans* of the whole disgraceful scene was the utter incompetence of Mr. Mellor. From the first he has never had any control over the House, and the concluding scene was but the culmination of a long series of episodes which proved his utter unfitness for the post thrust upon him by the Government. There have been many mistakes this session, but the worst of all mistakes was the refusal to continue Mr. Courtney in the Chair as Deputy Speaker. Mr. Mellor was installed as the strong man who was believed to be capable of effectively forcing the Bill through when Mr. Courtney, being a Unionist, would have raised difficulties. Never was there a more fatal miscalculation. But Mr. Mellor is not court martialled. Mr. Mellor has not even been asked to resign. Mr. Mellor remains where Mr. Mellor was placed at the beginning of the session—the wrong man in the wrong place, without either prestige, authority, or capacity to enable him to maintain discipline and secure order. After Mr. Mellor the only offenders who deserved punishment were Mr. Hayes Fisher and Sir Ashmead Bartlett, who were the first to resort to physical violence. Their only excuse is to say that they believed Mr. Logan was going to strike them. But this was an afterthought. The member who lays violent hands on another in a moment of excitement corresponds to the sailor who

after a collision raises a cry of panic and deserts the ranks. There was no such man on the *Victoria*. Unfortunately Mr. Hayes Fisher and Sir Ashmead Bartlett are still members of the House of Commons.

A Concatted
Assembly. It is a mistake, however, to exaggerate the significance of the outbreak of Don-

nybrook Fair in the House of Commons. That assembly thinks a great deal too much of itself, and it is perhaps just as well that it should for once suddenly become conscious of the contempt with which it is regarded by the country. The simple fact of the matter is that while its members imagine that it is the greatest and most august assembly in the world, the nation at large has learned to regard it as the most hopelessly incompetent and unbusinesslike body that exists for the purpose of legislation in the three kingdoms. The Mother of Parliaments indeed!—grandmother would be a more appropriate term, and a grandmother in her dotage. What more ridiculous spectacle can possibly be imagined than the way in which the House has dealt with the Home Rule Bill! Here is a measure of 37 clauses, which when printed occupy seven columns of the *Times*. The House devotes 64 days to the discussion of these clauses, and at the end of that time the nation learns that it has not even attempted to discuss 27 clauses, occupying five-and-a-half columns space, but has simply passed them without any consideration at all. It is all Tory obstruction, say the Home Rulers. It is all Mr. Gladstone and his guillotine, say the Unionists. A plague on both your parties, say the people. If you cannot apportion your time better to your work than this slovenly method of obstructing ten clauses and bolting forty, you are not fit for your place. The fact is, the House of Commons had much better go to school, either to the London County Council, or better still to the Assemblies of any of the Scottish Churches. These bodies know how to do business, and the House of Commons does not. Until it limits all speeches but those of mover and seconder of each motion to ten minutes, it will flounder on till it sinks deeper and deeper in public estimation.

The Home
Rule Bill.

I suppose I ought to congratulate the Government upon having discovered, in July, 1893, what I pressed upon them in vain in October, 1892. Why in face of the plainest possible warnings Mr. Gladstone persisted in inserting the preposterous and suicidal in-and-out clause in the Home Rule Bill no one as yet seems to be able to suggest, excepting those who assert that he put it in expressly in order to take it out after

it had drawn the enemy's fire. He has taken it out now, and it is better late than never. But instead of acting upon the only sound principle, and leaving the House of Commons intact, the Prime Minister must needs strengthen the hands of his adversaries by tacking a new Redistribution Bill of Irish seats and a reduction of Irish representation to his scheme for establishing a subordinate Parliament in Ireland. He has laid it down that Ireland ought only to have 80 instead of 103 members in the House of Commons, and his decision has been countersigned by his majority. But if Ireland has 23 members more than she ought to have, all decisions carried by the present House by less than 23 Irish votes have no moral weight. The votes of these 23 extra members ought to be deducted from the majority by which the Home Rule Bill is carried. But as the Government majority has repeatedly fallen below 23 on vital divisions, it follows that but for the votes of the doomed 23 the Bill itself would have been thrown out. Mr. Gladstone's persistence in tampering with the constitution of the House of Commons has furnished a new conclusive argument to the enemies of Home Rule.

The Financial Mr. Gladstone last month presented to **scheme, latest revised edition.** the House his third scheme of Home Rule Finance. His followers accepted it, as they accepted both its predecessors, with an alacrity which gave point to Mr. Chamberlain's sarcasm. "Mr. Gladstone says it is black, and they say it is good. Mr. Gladstone says it is white, and they say it is better." His latest proposal is to reduce Ireland's net payment to Imperial purposes by about half a million a year. The following is the present statement of account between Ireland and the Empire:—

<i>Spent in Ireland.</i>			
Civil Government Charges	£3,123,000
Constabulary	1,459,000
Loss on Post Office Account	52,000
Cost of collection of revenue	160,000
			£4,794,000
<i>Collected in Ireland.</i>			
Customs	£2,402,000
Excise	3,058,000
Stamps	707,000
Income-tax	552,000
Crown Lands	65,000
Miscellaneous	138,000
			£6,922,000

making a balance received from Ireland at present of £2,128,000 per annum for Imperial purposes, or one

twenty-eighth of the whole. Mr. Gladstone proposes that she shall in future pay one-third of her general revenue, amounting to £2,276,000, minus a sum of £487,000, granted on behalf of the constabulary, and a further sum of £160,000, representing the cost of collecting the Irish revenue. So far, therefore, as Home Rule affects our finances, we shall receive £1,615,000 a year instead of £2,128,000, the Irish paying, under Home Rule, one thirty-seventh instead of one twenty-eighth of the Imperial expenditure. This is not exactly the *status quo ante* which British tax-payers were led to expect. The British elector is prepared to let the Irish govern themselves. He is not prepared to subsidise them for doing so.

It is anticipated that about forty Peers **The Ultimate Outcome.** will be found, out of four or five hundred who will go into the lobby, in support of this Bill, which will be thrown out by an unprecedentedly large majority. The question then arises, What next? Rumour is rife that next year the Bill will be introduced into the House of Lords, in order that the House of Commons may have a chance of getting through some English business. What ought to be done is to abandon all attempt to frame a Home Rule Bill at Westminster. Mr. Gladstone, or Mr. Gladstone's successor, would expedite business immensely, and would moreover be taking the best and most logical course, if he were to introduce a Bill of less than half-a-dozen clauses, bringing into existence a constituent assembly at Dublin, instructed to draw up for submission to the Imperial Parliament a measure expressing the views of the Irish nation as to the best method of enabling Ireland to manage her own affairs. All these details which have blocked Parliament this year are unnecessary. It is not for the Imperial Parliament to devise a complete scheme of Home Rule and then to force it on Ireland. The proper thing is for Irishmen to decide upon their own scheme of Home Rule, to thresh it out clause by clause in a national convention at Dublin, and then to bring it to Westminster to be considered by the Imperial Parliament. That would be much more consonant with the national dignity of Ireland than the acceptance of a cut and dried Home Rule scheme from Westminster.

The Referendum. One of the questions which I submitted to all candidates through my helpers at the last general election was that of the Referendum. Few of them understood the question, and most of them treated it as one altogether without the pale of practical politics. Lord Salisbury, however, seems disposed to adopt it as the rallying cry

of the Tory party. Speaking at the Junior Constitutional Club on July 7th, he remarked that Mr. Gladstone's policy was an impartial combination of hustle and gag, and that hustle and gag would never govern the English people. Proceeding to discuss the question of a second Chamber, Lord Salisbury said :—

"I doubt whether the whole of the stress of resisting the great Constitutional attack ought to be thrown upon such a Chamber. . . . Wherever the foundations of the country itself are to be dealt with, and attack intended upon them, in one form of machinery or the other, the nation is directly called into council upon this issue, and this issue only, and asked whether it will have it so."

Lord Salisbury concluded by asking his friends to consider "whether we do not require some more definite, technical, absolute safeguard that the Constitution by which the nation lives shall not be changed without the nation's will." That is right so far as it goes. But it does not go far enough. It is doubtful whether we shall ever get the Referendum solely as a veto upon change. It will be carried as in Switzerland by those who regard it as the ultimate sanction of the principle of the popular sovereignty—the crowning of King Demos.

The German Emperor, who has paid a flying visit to England to be present at the yacht-racing at Cowes, had the satisfaction before his departure of knowing that the Army Bill had been passed. The Third Reading was carried by 201 votes against 185. The military authorities will now have a free hand to strengthen their fighting-machine within the limits approved by the Reichstag. No one can be surprised that they should desire to increase the number of their soldiers in view of what is going on in both of their frontiers. The Russians have just begun a tariff war with Germany, which has led Germany to retaliate by clapping an extra 50 per cent. duty on Russian goods; whilst in France we have the unrest of Paris, which is disagreeably manifested over the students' row at the beginning of the month, and the recrudescence of French Chauvinism in the Far East. The Russian-German tariff war, owing to the complications which may follow in the relations between Russia and Austria, will be watched with great interest.

The last telegram received from Dr. Nansen. Nansen was dated Berlebagg, July 21st. He was then just starting for Nova Zembla, where he was about to pick up his first thirty sledge dogs, after which he has to coast eastward to the Olonetz River, where he will

pick up another twenty-six dogs. At the end of this month he hopes to reach the West Coast of the Siberian Islands. From thence he will run northward as far as he can, and when open water fails him, the *Fram* will be allowed to drift with the ice. He is delighted with his ship, but the reports of the ice are bad, and he has still to get through the Kara Sea. We shall probably hear from him twice or thrice before the darkness settles down upon the *Fram*.

The beginning of last month was marked by the great tragedy in the West Riding coalfield, when the Thornhill Colliery fired, owing to the use of naked lights in certain portions of the mine which had hitherto been regarded as free from gas. The month closed upon a still greater misfortune in the shape of an industrial dispute between the coal owners and the miners. The owners insist upon a reduction of 25 per cent. of what they call the standard rate of 1888, upon which an advance of 40 per cent. was made up to August, 1890. The owners assert that this is necessary owing to the state of trade, and they offered to submit their case to arbitration. The Miners' Federation, however, refuse absolutely to assent either to the reduction or to the arbitration upon the proposal. As a result the coal industry of the Midlands and of West Riding in Lancashire is paralysed. Before the miners resume working a great many more persons will probably have died as the result of deprivation and anxiety than were blown out of existence at Thornhill. As, however, they will die by singles, no one will take much notice of them. It is only when deaths are massed that they create a sensation.

The Royal Geographical Society made itself ridiculous last month by deciding that women should not be admitted to be Fellows on the same footing as men. The vote at the General Meeting was 172 to 158. A plebiscite of the members of the Society showed that only 500 were against the admission of women, while 1,200 were in their favour. The speeches of the opponents were interesting, and deserve to be kept as monumental examples of the imbecility of the male. It is to be feared that Sir Richard Webster and Mr. Curzon and others, who seem to be of opinion that it will break down the natural barrier between the sexes if women are allowed to put F.R.G.S. after their name, will regard with dismay the attempt that is being made by leading women in England and Scotland to secure a National Memorial, signed by

women, regardless of party distinction, in favour of the enfranchisement of their sex. Few movements have made more rapid progress of late years than this, and it is to be hoped that the Memorial will be signed by all who have the interests of civilisation and progress at heart.

An Experiment. A very interesting experiment has been made in the United States.

Liquor Monopoly. South Carolina, of all States in the world, decided to try a modification of the Gothenburg system. On the 1st of July no liquor was to be sold in the State except by the State itself. The supply of all drink, in short, was to be made the monopoly of the strictest kind, and all the corn whisky on which the South Carolinians were allowed to get drunk was to be labelled "Warranted U.S. Standard proof and chemically pure. South Carolina State Dispensary." The State had laid in large quantities of liquor, and the Governor calculated that he would be able to make a net profit for the ratepayers of £100,000 per annum. Unfortunately for the success of this experiment a judge has declared the law unconstitutional, and until the Supreme Court decides the question no one knows exactly what is going to be done. South Carolina is hardly the State in which one would have expected so daring an experiment in the Drink Question, but better South Carolina than nowhere.

Sunday Closing. The six-days' week party last month gained a very signal victory at Chicago. **World's Fair.** The directors of the World's Fair having obtained a Government grant on condition that the Fair was not opened on Sundays, decided to open it on the ground that their exchequer could not stand the loss of Sunday closing. Their action was upheld as legal, and great was the exultation on the part of the Sunday openers. The Sunday-rest men were considerably crestfallen; but it was only for a time. To the astonishment of every one, after keeping the exhibition open every Sunday until the 16th of July, the local directors have come to the conclusion that they lost money on the Sunday business. The exhibitors would not give up their rest day, and the general public would not go to the Fair on Sunday. The result is a still more signal triumph for one day's rest in seven than anybody ventured to hope for. After this it will be difficult for anyone to pretend that the blue laws are enforced upon an unwilling population by puritanical despots at Washington and elsewhere.

Australian Cheer. I am glad to see from the *Australian Review of Reviews* that there are some people who keep up their hearts in spite of the series of smashes which have appalled British investors in Australian securities. Mr. Fitchett seems quite hopeful, and even asserts that the chief result of the crisis for depositors of the Australian banks will be that they will get six or seven per cent. instead of four per cent. This is certainly looking at the situation through very roseate spectacles. What is very evident is that the various Colonies are setting to work to economise with a will. If they can but keep in this mood long enough, there is little doubt that they will emerge from their difficulties with their prosperity much more solidly assured than it has been for some time past. The description which Mr. Fitchett gives of the Public Works which New South Wales has to show for its expenditure is certainly a very strong contrast to the barracks and artillery and powder and shot which European States have to show for the most of their borrowed money.

The London County Council. The London County Council is, at the present moment, struggling with the House of Lords over the Bills which it considers to be indispensable for the good government of the Metropolis. So far as can be seen at present, there is no reaction against the progressive policy of the Council visible. The painful incident which vacated Mr. Tims' seat for Battersea might naturally have been expected to damage the Progressive cause in the constituency. Mr. Willis, however, was returned by a large majority. The Council keeps up its record of good attendance. The Chairman, who on the 25th reviewed the work of the past year, stated that the Minutes of the preceding twelve months constitute a volume of 1,360 pages, recording the work of nineteen Standing Committees, which, with their Sub and Special Committees, have met on not less than 1,400 occasions—i.e., there have been more than four committee meetings per day all the year round. The attendance of members at the Council has gone up from the average of 104-110 in 1891, to 114 in 1893. Mr. Hutton's address is a very valuable document, and should be kept by all those who wish to understand the working out of some of the most interesting problems in modern city government.

DIARY FOR JULY.

EVENTS OF THE MONTH.

30. Annual Meeting of the International Arbitration and Peace Association, at Westminster Palace Hotel.
- Opening Meeting of the Head Masters' Association, at Oxford.
- Celebration of the Anniversary of the Opening of Holloway College.
- Proclamation issued by President Cleveland, calling a Special Meeting of Congress in August.
- July 1. Railway Accident near Blackpool; four killed and many injured.
- Resignation of the Argentine Cabinet.
- Annual Dinner of the Cobden Club, at Greenwich.
- Opening of the National Workmen's Exhibition at the Agricultural Hall, Islington, by the Prince of Wales.
- Dinner at the Mansion House to the Representatives of Art and Literature.
- Publication of the Scheme of Arrangement of the Queensland National Bank.
- Student Riots in Paris.
2. Departure of Lieutenant Peary's Second Expedition to the Arctic Regions.
3. Publication of Rear-Admiral Markham's Despatches on the Victoria Disaster.
- The proposal that women should be elected Fellows of the Royal Geographical Society, rejected by a majority of fourteen.
- First London Meeting of the Museums Association.
- Failure of the Commercial Bank of Manitoba.
- Richard Kenyon Benham, and Albert Benham, found guilty of fraud in connection with the London and General Bank; the former sentenced to fourteen years' penal servitude, and the latter to five years.
4. Renewal of Student Riots in Paris.
- Opening of the German Reichstag by the Emperor.
- Colliery Disaster near Dewsbury; 138 killed.
- Inaugural Meeting of Navy Records Society.
- New Zealand Treasurer made his Budget Statement.
- Proclamation, at Pietermaritzburg, of the New Constitution granting responsible Government to the Colony.
- The London County Council decided not to purchase the Site in Parliament Street, for the erection of a new hall and offices.
- Discussion on the Sunday Opening of Museums in the Upper House of Convocation of Canterbury.
5. The Session of the Prussian Diet closed by the Emperor.
- The Parliament of Western Australia opened by the Governor.
- Professors Thowman and Kayaian, the Armenian Prisoners at Angora, pardoned.
- Further Fatal Riots in Paris.
6. Marriage of the Duke of York and Princess Victoria Mary of Teck.
- Close of the Labour Exchange in Paris.
- Formation of the New Argentine Ministry.
- Cyclone in Western Iowa.
- Rioting in Madrid.
7. Conference of the Houses of Convocation of Canterbury on Religious Education.
- First London Sitting of the Welsh Land Commission.
- Concluding Meeting of the Museums Association.
- Introduction of the German Army Bill into the Reichstag.
- James Tims, L.C.C., sentenced to three months' imprisonment for fraud against a Railway Company.
8. Religious Riot in Montreal.
- Annual Meeting of the Anglo-Jewish Association, at the Central Synagogue Chambers.
- Banquet to the King and Queen of Denmark at the Guildhall.
- Boating Accident at Skegness; twenty-nine lives lost.
- Debates in the French Chamber on the Paris Riots.
- Fraut Willis sentenced to five years' penal servitude for defrauding the Portsea Island Building Society.

9. Labour Demonstration in Vienna.
10. Arrival of the Khedive at Constantinople.
- Fatal Fire at Chicago.
- Adoption of the Scheme of Re-arrangement of the City of Melbourne Bank.
- Failure of the New Zealand Loan and Mercantile Agency Company, Limited.
- Opening Meeting of the Methodist Conference at Bristol.
11. Sir Gordon Spragg presented his Budget in the House of Assembly at Cape Town.
- Mr. John Deasy, M.P., fined for common assault on a girl.
- Commencement of the Naval Manœuvres.
- Opening of the Bisle Meeting.
- Opening Meeting of the Institution of Naval Architects at Cardiff.
- Report received of a Matabele raid in Mashonaland.
- Annual Meeting of the National Society for Woman's Suffrage at Westminster Town Hall.
- Opening Meeting of the Reunion of the Churches Conference at Lucerne.
12. Orange Demonstrations against the Home Rule Bill held in Ulster.

THE REV. H. J. POPE,
President of the Wesleyan Conference.
(From a photograph by Messrs. B. Scott and Son,
Cardiff.)

- Celebration of the Jubilee of Marlborough College.
- Annual Meeting of the Society of Chemical Industries at Liverpool.
- Collision of the Gun-Boat *Albercore* and the Steamer *Louise*.
- M. Decrais appointed French Ambassador in London.
13. Report received of Fighting in Samoa.
- Second Reading of the German Army Bills carried by a majority of 11.
- Deputation to Mr. Gardner, praying that the Order prohibiting the Importation of Canadian Cattle be withdrawn.
- Annual Meeting of the Royal Niger Company.
- First Meeting of the Canterbury Diocesan Conference.
- Laws passed by the Victorian Assembly to reduce the Salaries of Governors, Ministers, Members of Parliament, etc.
- Passing of the Industrial Tax Bill by the Portuguese Upper House.
- The Court of Appeal sanctioned a Scheme for the Reconstruction of the English, Scottish, and Australian Chartered Bank.
- The Belgian Chamber decided that Article I. of the Constitution should be revised to enable Belgium to acquire Colonial Possessions.
- Fighting near Bangkok between the French and Siam.
14. Celebration of the French National Fête.
15. Third Reading of the German Army Bills.
- Opening of the National Congress of Trade Unions in Paris.
- Fatal Railway Accident in Spain.
- Close of the Portuguese Cortes.
- Opening of the Trial of the Impeachment of Servian Ex-Ministers.
17. Court Martial on the Loss of the *Victoria* opened at Malta.
- Presentation of an Address to Sir John Lubbock by the London Chamber of Commerce.
- News received of the Capture of Admiral Wandenkok and other Brazilian Insurgents.
18. Meeting of the International Maritime Congress at Westminster.
- Great Fires in the City of London.
- Debate in the French Chamber on Affairs in Siam.
- Opening of the Wesleyan Conference at Cardiff.
19. Mr. G. Downes Carter, Treasurer, made the Budget Statement in the Victorian Assembly.
- The Servian Parliament agreed to the Impeachment of the Avakunovich Cabinet.
- Annual Meeting of the Royal College of Music at Marlborough House.
- Annual Meeting of the British School at Athens at Burlington House.
20. Laying of the First Stone of New Harbour at Dover, by the Prince of Wales.
- Report received of fighting in Mashonaland.
- Delivery of the French Ultimatum to the Siamese Government.
21. Closing Session of the International Maritime Congress at Westminster.
- Fighting in Nicaragua.
22. Mgr. Clement, Metropolitan of Bulgaria, found guilty of inciting the people against the Prince and the Government, and sentenced to perpetual banishment.
- Report received of a Revolution in the State of Santa Catharina in Brazil.
- Departure of the French Minister from Bangkok.
- Sir Thos. M'Donnell delivered his Annual Budget Statement in the Queensland Parliament.
- County Council Election at Battersea; Mr. W. Willis (Progressive) elected.
- Close of the Bisle Meeting.
- Reply of the Siamese Government to the French Ultimatum.
- Prorogation of the French Parliament.
- Conference at Oxford, on the Attitude of the Church toward the Social Problem.
24. Annual Meeting of the British Nurses' Association at Oxford.
- Opening of the Celebrations of the Winchester College Quingentenary.
- Announcement by the French Government of their intention to blockade the Coast of Siam.
- Bombardment of Managua, Nicaragua, by the Insurgents.
25. At a Meeting of the London County Council the Chairman made his Annual Statement.
- In the Libel Action of J. Havelock Wilson v. *The Evening News*, Verdict returned for the Defendant.
- Signing of the Convention fixing the Boundary Line between the British and German Protectorates in Kilima Njaro.
- Visit of the Prince of Wales to the Winchester Celebrations.
26. In the Libel Action of Mr. J. H. Wilson *versus* the *Shipping Gazette*, Jury found for the Defendant.
27. Close of the *Victoria* Court-Martial. Acquittal of Captain Bourke and other survivors.
- Conference, at Derby, of Railway Signalmen to discuss Hours of Labour, etc.
28. Strike in the Coal Trade commenced.
- Public Health Congress at Edinburgh.
- Retirement from Political Life of Señor Castelar.
- First Sitting of the Currency Commission at Singapore.
29. Arrival of the German Emperor at Cowes.
- State Visit of the Lord Mayors of London and Dublin to the Public Health Congress at Edinburgh.
- The French Ultimatum accepted by Siam.

29. Provincial Revolution in Argentine. Sentences on Socialist Workmen at Prague; thirty-five sent to prison.
Jubilee Celebration of the Rothamsted Experiments.
30. General Election in Bulgaria.

NOTABLE UTTERANCES.

- June 30. Mrs. Besant and Mrs. Frederika Macdonald, at St. James's Hall, on Theosophy.
July 1. Mr. Balfour, at Stockport, on Mr. Gladstone's Policy.
Mr. Asquith, at Twickenham, on the Police.
Sir Charles Tupper, at the Westminster Palace Hotel, on Canada.
Mr. S. Woods, at Nunceaton, on the Crisis in the Coal Trade.
3. Earl of Dunmore, at the Royal Geographical Society, on the Pamirs and Central Asia.
5. Lord Randolph Churchill, at Carlisle, on the Closure.
Lord Wolmer, at Coventry, on Home Rule for Ireland.
6. Mrs. Henry Fawcett, at Ilkley, on University Education for Women.
7. Lord Salisbury, at the Junior Constitutional Club, on Home Rule for Ireland.
Mr. Dillon, at Hanley, on Mr. Chamberlain.
8. Prince Bismarck, at Friedrichsruh, on the Smaller German States.
10. Mr. Albert Spicer, at Exeter Hall, on the Armenian Prisoners.
12. Lord Randolph Churchill, at Rawtenstall, on the Political Situation.
Mr. Chaplin, at Heckington, on the Agricultural Situation.
Duke of Fife, at the Grafton Galleries, on the Education of Deaf Mutes.
Mr. Arnold Morley, at a meeting of a Telegraph Messengers' Institution, on the Post Office.
13. Lord Charles Beresford, at the London Chamber of Commerce, on the Protection of the Mercantile Marine during War.
General Booth, at Exeter Hall, on the Salvation Army.
Lord Londonderry, at St. Stephen's Club, on Ireland.
14. Mr. Labouchere, at Walworth, on the Political Situation.
15. Mr. B. Pickard, at Barnsley, on the Coal Crisis.
18. Mr. A. J. Balfour, at Willesden, on Hospital Accommodation in London.
Mr. T. W. Russell, at St. Martin's Town Hall, on Home Rule.
19. Mr. William O'Brien, at Stratford, on the Home Rule Bill.
Mr. A. J. Balfour, at the United Club, on the Policy of the Government.
Lord Randolph Churchill, at Boston, on the Agricultural Situation.
Lord Herschell, at the Hotel Métropole, on Musical Education.
20. Duke of Cambridge, at Grosvenor House, on Hospital Work.
21. Miss A. Taylor, at Eccleston Street, on Inner Tibet.
Sir Albert Rollit, at the London Chamber of Commerce, on the Commercial Situation.
Prince Bismarck, at Friedrichsruh, on the German Government and Political Parties.
22. Lord Randolph Churchill, at Paddington, on his Candidature at Central Bradford.
Lord Farrer, at the Cobden Club, on the Economic Situation.
Mr. Pickard, at Barnsley, on the Dispute in the Coal Trade.
Lord George Hamilton, at Chiswick, on the Government.
Lord Roberts, at Bisleigh, on the Bisleigh Meeting.
Sir Walter Foster, near Birmingham, on the House of Lords and the Home Rule Bill.
24. Duke of Devonshire and Mr. Mundella, at Westminster, on Technical and Secondary Education.
26. Lord George Hamilton, at Ealing, on the Political Situation.
27. Lord Lamington, at the London Chamber of Commerce, on Siam.
28. Lord Roberts, at Glasgow, on his Indian Experiences, etc.
Sir Alfred Lyall, at Cooper's Hill Engineering College, on India.
29. Sir Wilfrid Lawson, at Trowbridge, on the Local Veto Bill.

PARLIAMENTARY RECORD.

HOUSE OF LORDS.

- June 30. Discussion on Home Rule for Scotland.
Third Reading of the Sale of Intoxicating Liquors (Ireland) Bill.
The Friendly Societies Act (1875) Amendment Bill passed through Committee.
July 3. Discussion on the Indian Military Contributions.
4. Statutory Rules Procedure Bill passed through Committee.
Second Reading of the County of the City of Glasgow Bill.
Third Reading of the Barbed Wire Fences Bill.
7. Discussion on the Royal Naval Reserve.
Second Reading of the Improvement of Land (Scotland) Bill.
Third Reading of the Prison Officers' Superannuation (No. 2) Bill, the Wild Birds' Protection Bill, and Elementary Education (Religious Instruction) Bill.
10. Second Reading of the Merchant Shipping (Fishing Boats) Acts (1883 and 1887) Amendment Bill.
Third Reading of the Rivers Pollution Prevention (No. 2) Bill.
Improvement of the Land (Scotland) Bill passed through Committee.
11. Third Reading of the Friendly Societies Act (1875) Amendment Bill.
13. Second Reading of the Reformatory Schools Bill.
The Merchant Shipping (Fishing Boats) Acts (1883 and 1887) Amendment Bill, and the Infectious Hospitals Bill passed through Committee.
Third Reading of the Barbed Wire Fences Bill.
Discussion on the Irish Land Laws.
14. Second Reading of the London County Council (Money) Bill.
An Address of Congratulation on the Marriage of the Duke of York and Princess May, moved by Lord Kimberley, and seconded by the Marquis of Salisbury.
17. London County Council (General Powers) Bill read a third time and passed.
Discussion on the Administration of Justice in Ireland.
Second Reading of the Companies (Certificate of Incorporation) Bill.
18. Places of Worship (Sites) Bill read a third time.
Trust Investment Bill read a second time.
Reformatory Schools Bill passed through Committee.
Discussion on the Millbank Prison Site.
20. Second Reading of the Statute Law Provision (No. 2) Bill.
Land Transfer Bill and the Supreme Court of Judicature Bill passed through Committee.
Discussion on Elementary Education.
21. Debate on the United States Constitution and the Home Rule Bill.
Second Reading of the Congested Districts Board (Ireland) (No. 3) Bill.
22. Sir George Dibbs, at Penrith, N.S.W., on the Finance of the Colony.
24. Discussion on the Lord-Lieutenant of Ireland and the Irish Unionists.
Trust Investment Bill and the Congested Districts Board (Ireland) (No. 3) Bill passed through Committee.
Improvement of Land (Scotland) Bill read a third time.
The Consolidated Fund (No. 3) Bill read a second time.
25. Discussion on the Betterment Principle of the London Improvements Bill.
Redemption of Rent (Ireland) Act (1891) Amendment Bill read a second time.
The Consolidated Fund (No. 3) Bill read a third time.
27. Statement by Lord Rosebery on the Siamese Question.
Second Reading of the Law of Commons Amendment Bill.
28. Discussion on the Licensing Question.

HOUSE OF COMMONS.

- June 30. Debate on Mr. Gladstone's Proposal to apply Closure to the Home Rule Bill, continued: Amendments moved by Mr. Byrne, Lord Wolmer, and Mr. Fisher, negatived; Mr. Gladstone's Resolution carried by 299 to 267.
Committee of Supply: Discussion on the Opium Traffic in India.

- July 3. Committee on Clause 5 of the Home Rule Bill: Mr. Ambrose's Amendment withdrawn and [an Amendment proposed by Mr. Gladstone agreed to; Amendments moved by Lord Wolmer and Mr. Brodrick negatived].
Second Reading of the Congested Districts Board (Ireland) (No. 3) Bill.
4. First Reading of the Intoxicating Liquor (Ireland) Bill.
Committee on Clause 5 of the Home Rule Bill continued: Amendments moved by Mr. Arnold Forster, Mr. Fisher, Sir Henry James (two), and Captain Naylor-Leyland, negatived.
5. Third Reading of the Metropolitan Police Order Bill.
Committee on Clause 5 of the Home Rule Bill continued: Amendments moved by Lord Carmarthen, Mr. G. Balfour, T. E. Bolton, and Mr. Bousfield negatived.
6. Committee on Clause 5 of the Home Rule Bill continued: Amendments moved by Lord Wolmer (two), Viscount Cranborne, Mr. Parker-Smith, negatived; Clauses 5, 6, 7 and 8 passed.
7. Second Reading of the London Improvements Bill.
Discussion on Justice in Clare.
Motion to suspend Mr. Conybeare for breach of privilege carried, but on his apologising, it was withdrawn at the suggestion of the Speaker.
Committee on Clause 9 of the Home Rule Bill.
10. Committee on Clause 9 of the Home Rule Bill continued: Amendments moved by Mr. Ambrose, Mr. John Redmond, and Mr. Heneage, negatived.
Second Reading of the Rivers Pollution Prevention Bill.
Redemption of Rent (Ireland) Act (1891) Amendment Bill read a third time and passed.
11. Committee on Clause 9 of the Home Rule Bill continued: Amendments moved by Sir John Lubbock, Sir Charles Dilke, Mr. F. Seton-Karr, and Mr. Rentoul, negatived; Mr. Sexton suspended from the House for "grossly disorderly" conduct.
Third Reading of the Rivers Pollution Prevention Bill.
12. Committee on Clause 9 of the Home Rule Bill continued: Amendment moved by Mr. Parker Smith negatived. Mr. Gladstone announced that the Government would withdraw sub-sections 3 and 4 of Clause 9.
13. Committee on Clause 9 of the Home Rule Bill continued: Mr. Gladstone's Motion to omit sub-sections 3 and 4 passed; Clause 9 passed.
Clause 10 struck out of the Bill.
Clauses 11, 12 and 13 negatived without a division.
Clauses 14, 15, and 16, postponed.
Clause 17 negatived without a division.
Clauses 18 and 19 passed.
Clauses 20 and 21 negatived without a division.
Clauses 22, 23, 24, 25, and 26 passed.
14. An Address of Congratulation on the Marriage of the Duke of York and Princess May, moved by Mr. Gladstone, and seconded by Mr. Balfour.
Committee on the Home Rule Bill: Mr. John Morley's Motion authorising payments to be made out of the Consolidated Fund in connection with the Government of Ireland agreed to.
The Congested Districts Board (Ireland) (No. 3) Bill passed through Committee and read a third time.
Irish Education Act (1892) Amendment (No. 2) Bill, read a second time.
Housing of the Working Classes Act (1890) Amendment Bill passed through Committee.
17. Committee on Clause 27 of the Home Rule Bill: Amendments moved by Mr. Sexton (three), Mr. Seton-Karr, General Goldsworthy, Mr. A. J. Balfour, Mr. Hanbury and others withdrawn. Three amendments by Mr. John Morley agreed to. Amendments moved by Mr. Seton-Karr agreed to. Clause agreed to.
Committee on Clause 28 of the Home Rule Bill.
Housing of the Working Classes Act (1890) Amendment Bill and the Industrial and Provident Societies Bill read a third time.

23. Committee on Clause 28 continue: Amendments moved by Mr. T. W. Russell and Mr. Hayden negative; and a series of amendments by Mr. John Morley agreed to.
24. Committee on Clause 28 of the Home Rule Bill continue: Several Amendments moved by Mr. John Morley agreed to; and Amendments moved by Mr. Sexton and others negative; Clause finally passed.
- Committee on Clause 29 of the Home Rule Bill: Amendment moved by Mr. John Morley agreed to, and the Clause passed.
- Second Reading of the Elementary Education (School Attendance) Bill.
- The Consolidated Fund (No. 3) Bill and the Married Women's Property Act (1882) Amendment Bill passed through Committee.
- Second Reading of the Labour Dispute (Arbitration) Bill deferred.

24. Irish Education Act (1892) Amendment (No. 2) Bill, and the Elementary Education (Blind and Deaf Children) Bill, read a third time.
25. Discussion on the Lords' Amendments to the London County Council (General Powers) Bill. Committee on Mr. Gladstone's New Clause of the Home Rule Bill continue: Amendment moved by Mr. John Redmond negative; and a further Amendment by Mr. Chamberlain proposed.
26. Committee on Mr. Gladstone's New Clause of the Home Rule Bill continue: Amendments moved by Mr. Chamberlain, Sir John Lubbock, and Sir John Gorst negative.
- Married Women's Property Act (1882) Amendment Bill read a third time.
27. Ministerial Statement on France and Siam. Committee on the Home Rule Bill resumed: Discussion on Financial Arrangements by Mr. Chamberlain and others, followed by a violent scene: Mr. Clancy's Amendment negative; Mr. Gladstone's New Financial Clause carried; Clauses 14, 15, and 16 carried, and the Bill passed through Committee.
28. Sir E. Grey made a Statement on Siam. Vote for Public Education in Scotland agreed to. Discussion on Agricultural Depression.

20. J. E. Martin, Librarian of the Inner Temple, 71. Prof. Delf, of Belfast. General W. C. R. Macdonald. Countess Amelia Higel, née Teak, 54. Franz Nissel, Austrian dramatic poet, 62.
21. T. W. Davis, Mayor of Halifax, 47.
22. Baron von Bauer, Austrian Minister for War, 68.
23. W. Wintens, historian, 58. E. W. Verriand, 55. Henri Gosse.
24. Canon Frith, 85. Sibella B. Edgecombe ("Selwyn Eyre"), novelist. Judge Patterson, of the Supreme Court of Canada, 71. Lieut. A. C. L. Cameron, R.N. E. R. Morris, Welsh Archaeologist.
25. John Siddon.

THE LATE M. GUY DE MAUPASSANT.
(From a photograph by Nadar, Paris.)

2. Committee on Clause 30 of the Home Rule Bill: Amendments moved by Mr. T. H. Bolton, General Goldsworthy, and Mr. Sexton negative; Mr. Wyndham's Amendment withdrawn; and an Amendment moved by Mr. Morley (standing in Mr. Gladstone's name) agreed to; Clause passed.
- Clauses 30, 31, 32, 33, 34, 35, 36, 37, 38, and 40 agreed to.
- Clause 39 negative.
- Consolidated Fund (No. 3) Bill read a third time.
21. Committee on the Home Rule Bill: Mr. Gladstone moved to insert after Clause 9 a new Clause dealing with the financial arrangements between Great Britain and Ireland.
- Irish Education Act (1892) Amendment (No. 2) Bill passed through Committee.
22. Committee on the Home Rule Bill continue: Discussion on Mr. Gladstone's New Clause continued, and the Second Reading carried by a majority of 35.

OBITUARY.

THE UNIVERSITY OF GLASGOW.

CHARACTER SKETCH: AUGUST.

LORD KELVIN, P.R.S.

IN the ranks of science at the present time three captains are supreme in their own lines--Pasteur in France, Von Helmholtz in Germany, and Lord Kelvin in the United Kingdom. Yet although for many

years Sir William Thomson has been regarded by his colleagues as the greatest physicist of his generation, when he was elected to the Chair of the Royal Society of London, and subsequently raised to the peerage on his scientific merits, he was something of a "dark horse" to the English public. A man of science may enjoy a great reputation in his peculiar sphere and still be unknown to the masses. As a rule men do not understand the mystery of his work or appreciate its value, and women prefer accomplishments that appeal more to the heart. Philosophers, alas! do not win the affection of the people so easily as poets, artists, musicians, and actors. They may be respected, even admired; but they are seldom loved, unless by personal friends. In the windows of London photographers we shall find a perfect galaxy of popular favourites, "beauties" of Society coming from who knows where, displaying their charms, and vanishing

goodness knows whither, serpentine skirt-dancers, the last new novelist, the boxing kangaroo, would-be laureates, the singer of an idiotic song, fashionable painters, and third-rate actors and actresses—all these and more; but rarely, if ever, a man of science amongst them, except perhaps a Darwin, a Huxley, or a Tyndall. We may hope to see a muscular athlete like Sandow, but

we shall look in vain for an intellectual giant such as Lord Kelvin. The fact is somewhat humiliating in this age of science, and it is worth while to discover the why and wherefore. In the first place, Lord Kelvin has not

propounded any revolutionary doctrine such as the origin of species by natural selection, which comes home to every one and affects his manner of thinking for good or evil. Darwin certainly achieved a great notoriety by showing that mankind were probably descended from monkeys. Lord Kelvin has not shaken any creeds, and his researches are mainly of an abstruse kind which is "caviare to the general." In the next place, he has been too busy in extending our dominion over matter by original experiments, mathematical reasoning, and useful inventions, to cultivate the literary graces like a Tyndall or a Huxley, and win the plaudits of the multitude by his trenchant criticism or his charming exposition. Moreover, his residence in Glasgow has withdrawn him from the vortex of metropolitan publicity. Had he lived in London, he might have been induced to fritter away his splendid powers on matters

From a photograph by

LORD KELVIN.

[Annan, Glasgow.]

of the moment, whereas in Glasgow he was free to employ them in those high investigations for which they were adapted.

The Scotch, he it said, have long regarded him as an intellectual glory, and his photograph is quite a staple in the shops of Sauchiehall and Princes Streets.

Many think Lord Kelvin a native of Scotland, but he

was born in Belfast on June 25th, 1824. He is, however, a scion of the Scots-Irish race of Ulster which has been so prolific in genius. His father, Dr. James Thomson, professor of mathematics in the Royal Academical Institute, Belfast, was in 1832 appointed to the chair of mathematics in his alma mater, the old College of Glasgow which formerly stood on the west side of the High Street, at the "Bell o' the Brae," a spot memorable for an exploit of Sir William Wallace. His son William, who was destined to play a heroic part in the field of science, became a student of the college while a mere child of eleven or twelve, and astonished the older scholars in his father's class by his preternatural quickness in solving the problems. His talent for mathematics was indubitable, and his father sent him to St. Peter's College, Cambridge, where he graduated as Second Wrangler and first Smith's prizeman in 1845. The Senior Wrangler probably owed his triumph to ready writing, for one of the examiners was heard to say that he was unworthy "to cut Thomson's pencils for him," and he has since been forgotten.

While at Cambridge Thomson began to publish papers on physical subjects—for example, heat and electricity—but he was active in various directions, and so far from being the pale student, overcome with night work, he was given to open air sports, gained the Silver Sculls, and rowed in the winning boat of the Oxford and Cambridge race. Enrolled a Fellow of St. Peter's, he entered the laboratory of the famous Regnault in Paris, and in 1846 was called to the Chair of Natural Philosophy in his old college at Glasgow, a congenial post, which, in spite of tempting offers, he has never quitted and has rendered illustrious. In 1852 he espoused Miss Margaret, a daughter of Mr. Walter Crum, F.R.S., of Rouken Castle, Thornliebank, the famous calico printer, who was distinguished for his investigations on the nature of cotton fibre. She was an accomplished gentlewoman in every sense of the word, and very kind, they say, to the poor.

THE ATLANTIC CABLE.

A man of his pregnant mind and exuberant energy could not subside into a teaching machine. At the very least he would discover and invent. Professor Thomson did much more; he also became a practical engineer, an expert in patent right, a reformer in education, a vital power in the world. Genius makes its own opportunity. When in 1856 the late Mr. Cyrus Field had begun to realise his gigantic dream of uniting Europe and America by means of a telegraph line across the Atlantic Ocean, a difficulty arose which threatened to defeat all his plans. The electric signals passing through a long submarine cable were found to drag, and it was a question whether or not they would travel fast enough between Europe and America to pay. Mr. Faraday explained the mystery by showing that the electricity in the wire was self-impaired by the attraction of an opposite electricity which it excited in the surrounding water. It remained, however, for Professor Thomson to enunciate the law of this retardation and so enable engineers to design a cable which would give a satisfactory speed to the messages. Dr. O. Wildman Whitehouse, electrician to the Atlantic Telegraph Company, contested the accuracy of "Thomson's Law," but the young professor quickly disposed of his argument, and the directors of the company, recognising his ability, engaged his services. It is no exaggeration to say that he contributed more than any other scientific man to the ultimate success of that enterprise which was so repeatedly baffled and postponed. In addition to the law which governed the construction of the wire, he gave

a theory of the mechanical forces involved in laying it, and devised various means of testing it during the manufacture and submersion.

HIS MIRROR INSTRUMENT.

Moreover, he invented a new instrument for receiving the messages which were to be sent through it. The lagging of the electric currents, above mentioned, has the effect of making them run together into one bottom current with surface ripples which correspond to the separate signals of the message; and the ordinary telegraph apparatus used on overhead lines were not suited for this varying current. Thomson's "mirror instrument" is, however, beautifully adapted to interpret all its delicate fluctuations. A tiny magnet is fixed on the back of a mirror the size of a threepenny-bit, and suspended by a silk fibre in the centre of a coil of insulated wire, and a beam of lamplight is reflected from the glass upon a white screen. When the current from the cable passes through the coil the mirror-magnet swings to the right or left according as the current rises or falls, and the "spot" of light on the screen betrays its hidden movements to the eye of the telegraphist, who in this way reads the signals of the message. So sensitive is the arrangement that I believe it was Mr. Latimer Clark who signalled to America and back through two Atlantic cables with the current from a toy battery made in a silver thimble with a drop of acidulated water and a grain of zinc. The feat can be done with a voltaic cell made in a percussion cap.

The Atlantic cable brought the name of Professor Thomson into public notice, and when the Old World was finally coupled to the New by the *Great Eastern* in 1866, he, on returning home, was knighted by the Lord Lieutenant of Ireland.

HIS SIPHON RECORDER.

The rise of a new industry is one of those tides in the affairs of men which lead to fortune, and Sir William Thomson took advantage of it. With the "mirror instrument" the message leaves no trace, but has to be written down by the receiving clerk. Sir William therefore set himself to devise an apparatus which would write the message as it comes, and in a few years produced his matchless "siphon recorder," which, along with the "mirror," is now employed on most of the submarine cables throughout the globe. In this apparatus a light coil of insulated wire is suspended between the poles of a strong magnet, and connected to a fine glass siphon discharging ink on a strip of moving paper. When the electric current from the cable is passed through the coil it swings to one side or the other, like the needle in the mirror instrument, and, swerving with it, the point of the siphon pen draws a wavering line on the paper, which is a permanent record of the message.

HIS PARTNERS.

Simple as they appear in a short description, these rare inventions, owing to the subtlety of the problem, were not constructed without infinite pains. To exploit them properly, Sir William entered into a partnership with the late Mr. Cromwell Fleetwood Varley, F.R.S., who first introduced the condenser to sharpen the cable signals, and the late Mr. Fleeming Jenkin, Professor of Engineering in Edinburgh University, in conjunction with whom, in 1876, he brought out an automatic signalling key. The recorder was first adopted by Mr. (now Sir) John Pender on the Falmouth and Gibraltar cable, and made a public appearance at the memorable telegraphic *soirée* held in the summer of 1870 at his residence in Arlington Street. On this

occasion the Prince of Wales and a fashionable party took supper in a marquee into which telegraph wires from India, America, and other distant countries were brought, and Lady Mayo, wife of the Viceroy, despatched a message to her husband in India about half-past eleven, and received a reply before midnight, informing her that he was quite well at five o'clock next morning.*

Sir William and Professor Jenkin acted as the engineers for a number of submarine cables, including the French-Atlantic of 1869 and the Mackay-Bennett Atlantic of 1879, as well as the Brazilian and River Plate cables of 1873 and onwards, and the West Indian links of 1875. They accompanied several of these expeditions, and it was in July, 1873, while the cable ship touched at Madeira, on her way to South America, that Sir William, who had been a widower since 1870, made the acquaintance of his future wife, Miss Frances Anna, a daughter of Mr. Charles R. Blandy, the present Lady Kelvin, to whom he was married in the following year. On the same trip he introduced his well-known

chester, celebrated for his determination of the mechanical equivalent of heat. Joule's attention was called to a bundle of the pianoforte wire lying in the shop, and Thomson explained that he intended it for "sounding purposes." "What note?" innocently inquired Joule, and was promptly answered, "The deep C."

At this period Sir William revived the neglected Sumner method of ascertaining a ship's place at sea, and calculated a set of tables for its ready use. He also invented a means of enabling a lighthouse to signal its distinctive number by long and short flashes, according to the Morse telegraph code.

HIS ADJUSTABLE COMPASS.

His most important aid to navigation is, however, the adjustable compass which bears his name. Its origin is another proof that no labour is lost, no fact is useless, and that even the despised "popular" science can be of inestimable value, either to the giver or the receiver. Any experience, however odd or trivial, may start a good

LORD KELVIN'S SEAT OF NETHERHALL, LARGS.

method of sounding the deep sea by a steel pianoforte wire instead of the ordinary lead-line. The wire slips through the water so easily that "flying soundings" can be taken whilst the vessel is going at full speed, and a pressure-gauge attached to the sinker indicates the depth.

SOUNDING THE DEEP C.

The late Mr. James White, of Sauchiehall Street, Glasgow, an amiable and worthy man as well as a skilful mechanic, used to relate an anecdote about the new appliance for sounding, with great gusto. Mr. White was philosophical instrument maker to the University, a post once held by James Watt, and most of Sir William Thomson's apparatus were first constructed by him. One day, while the sounding machine was in preparation, Sir William entered his old shop in Buchanan Street, along with a guest, no other than the late Dr. Joule of Man-

idea in a fertile imagination, especially if it be primed with knowledge and quickened by the act of reading or writing. In 1874 Sir William began an article in *Good Words* on the mariner's compass, but a little to the wonder of the readers the second part did not appear until five years later. In the meantime he had invented an improved compass of his own, far superior to those in use. When writing the first paper he became alive to the faults of existing compasses, and set himself to produce one steadier at sea than the others, and cured of the error arising from the magnetism of the ship. "When there seemed a possibility of finding a compass which should fulfil the conditions of the problem," says Sir William, in his "Popular Lectures and Addresses," "I felt it impossible to complacently describe compasses which perform their duty ill, or less well than might be, through not fulfilling these conditions." He increased the steadiness of the card by lightening it and attaching to it a series of fine parallel needles,

* A fuller account of his inventions is given in my "Heroes of the Telegraph."

[Fergus, Larqs.

LORD KELVIN TEN YEARS AGO.

instead of fewer thick ones. Moreover, he compensated the magnetism of the ship by the aid of magnets and masses of soft iron placed at or near the binnacle, after a method published in 1837 by Sir George Biddell Airy, the late Astronomer Royal.

"IT WON'T DO!"

A wise Providence has imbued the soul of the inventor with a parental fondness for the creature of his brain and a sanguine faith in its future. Were it not so he might lose heart in the face of difficulties, whether arising from its own defects, or the indifference, even the opposition, of the world, and so his offspring would probably die of neglect. It often happens that learned experts cannot see the merits of a novel invention, and in the pride of their superior wisdom sometimes damp the zeal of the inventor with the cold water of their adverse criticism. Did not Professor Poggendorff, of the *Annalen*, stigmatise the first telephone of poor Philipp Reis as a chimera? Even the telephone of Bell and the phonograph of Edison were at first regarded as mere toys. One day, I remember, Sir William Thomson desired me to take his new compass

to Sir George Airy at the Royal Observatory, Greenwich Park, and ask him what he thought of it. A crude, experimental instrument, mounted on gimbals in a wooden box, it nevertheless contained the essential features of the improvement, and after I presented it to Sir George, he looked attentively at it for some time, apparently in deep thought, then shook his head, and simply said, "It won't do." When I returned to Sir William, and told him of this verdict, he ejaculated, with a trace of contempt, "So much for the Astronomer Royal's opinion!" The event showed that he was right, for the Thomson compass is the best extant.

A MEASURER OF ELECTRICITY.

Sir William has done more than any other electrician, living or dead, to introduce accurate methods of measuring electricity. As early as 1845 he devoted himself to this task, and, in addition to a large number of ingenious tests, familiar to electrical engineers all over the world, he invented two complete series of exquisite apparatus for measuring the electrical forces, both static and dynamic—that is to say, of electricity at rest and electricity in motion. Among the most useful of these are his portable, absolute, and quadrant electrometers, his delicate mirror galvanometer, a higher type of his "mirror instrument," which has become the mainstay of the electrician, and his more recent graded galvanometers, voltmeters, and balances, especially useful in electric light and power installations. Owing to his intimate knowledge of electricity, mechanics, and the properties of matter in general, as well as his intolerance of any imperfection or mere approximation to what is feasible, his instruments are thoroughly reliable, and the electrician uses them with the entire assurance that they are the finest and most accurate for the purpose in the present state of science. As to generators of the electric current, he has devised more than one form of voltaic battery, including a standard Daniell, for comparisons, and a large tray cell for giving a powerful current, as well as a dynamo which he brought out in conjunction

with Mr. Ferranti. A machine for predicting the level of the tides in any part of the world is probably his chief non-electrical invention. It was exhibited at the Loan Exhibition of Scientific Apparatus, South Kensington, in 1876, where Sir William had the honour of explaining its action to Her Majesty.

MORE DISCOVERER THAN INVENTOR.

Concurrently with these and other inventions Thomson has carried out an immense number of experimental and mathematical researches in every department of natural philosophy. Indeed, his scientific renown culminates over his discoveries rather than his inventions. Of his discoveries, the mathematical outnumber and probably outweigh the experimental results. The strongest point, the true citadel of his genius, is perhaps the faculty of applying mathematics to the solution of physical problems. Turn where we like in the annals of latter-day science, we shall encounter his name, and in molecular physics—especially electricity—it is dominant. In heat it is coupled with the names of Joule and Rankine: in the dynamical theory of gases with Clausius and Helmholtz; in electricity and magnetism with Faraday and Maxwell.

Hydrostatics is another of his favourite themes, particularly of recent years. Many of his papers are highly abstruse, and their mathematics can only be read by the mightiest intellects. The titles alone are sufficient to stagger the general reader. The ordinary scientific jargon is bad enough, but Lord Kelvin, like Thomas Carlyle and some other great writers, seems to have devised a peculiar style of his own to express the workings of his mind.

SAMPLES OF KELVINESE.

Witness the following title of a paper read before the last meeting of the British Association at Edinburgh in 1892: "The Reduction of every Problem of Two Freedoms in Conservative Dynamics to the Drawing of Geodetic Lines on a Surface of given Specific Curvature." Here is a still more elaborate specimen of Kelvinese: "A Simple Hypothesis for Electro-Magnetic Induction of Incomplete Circuits, with Consequent Equations of Electric Motion in Fixed Homogeneous and Heterogeneous Solid Matter."* The point of the joke lies in the word "simple." Apart from technicality, some of his sentences have quite a Gladstonian length and scrupulosity of qualification. No doubt they evince the extraordinary grasp and fine discrimination of his intellect, but they are often a severe tax on the intelligence of the reader. For example: "Two or more straight parallel conductors, supposed for simplicity to be infinitely long, have alternating currents maintained in them by an alternate current dynamo, or other electromotive agent applied to their ends at so great a distance from the portion investigated that in it the currents are not sensibly deviated from parallel straight lines. The other sets of ends may, indifferently in respect to our present problem, be either all connected together without resistance, or through resistance, or through electromotive agents. All that we are concerned with at present is, that the conductors we consider form closed circuits, or one closed circuit, and that therefore the total quantities per unit of them at any instant traversing the normal section in opposite directions are equal."

SOME OF HIS NEW WORDS.

New words become necessary in the progress of a science, and Sir William, like his late brother, Professor James Thomson of Glasgow University, has a propensity—I had almost said a "craze"—for coining them. It is not always easy to invent a word that shall be apt, brief, and euphonious without ambiguity of meaning. "Radian," for the unit angle, is one of his brother's happiest efforts, and "ward," for the direction of a force, is perhaps one of his unluckiest, as it is already overworked in connection with locks, gaols, hospitals and guardians. 'To

Sir William electricians are indebted for the useful term "mho," the reciprocal of the "ohm," or unit of resistance; while "motivity," "diffusivity," "irrotational circulation," "infinitesimal satellites," are some of the lingual jetsam which he is in the habit of throwing overboard and leaving to sink or swim. These peculiarities of style render some of his books, such as the classical "Thomson and Tait's Natural Philosophy,"

pretty stiff reading. His class book, Thomson and Tait's "Elements," is a theme of jest amongst the feebler students whose mental digestion requires a spoon diet. It is undoubtedly a concentrated pabulum—a kind of mental pemmican; but the robust scholars love to sharpen their understandings on its hard and wholesome fare.

HIS CHARACTERISTICS AS AUTHOR.

Even his "Popular Lectures and Addresses" is not quite free from the tendency of his powerful and cultivated mind to "fly over the heads of his audience," but on the whole it keeps within the reach of the beginner, and in spite of some difficult sentences, it is an intellectual treat of the highest order. Its educational value in opening the mind of the novice to the wonders of that molecular mechanism "in which we live, move, and have our being," cannot be over-estimated, and it possesses the indescribable charm of originality, the verve and vigour of a splendid intellect at home in the subject. The miscellaneous contents of the book afford an illustration of

the rich variety and vast extent of his attainments as well as the peculiar bent of his speculation. His imagination delights in ranging from the infinitesimally small to the inconceivably great, from the vibration of a molecule to the origin of the solar system. Here we find him discussing the cause of the earth's magnetism, a problem which has occupied his thoughts for many years, but apparently without bringing him any nearer to a solution. There, he is estimating the size of an atom, and with more success. He would fain persuade us that it is not so very minute after all. "Imagine," he says, "a globe of water or glass as large as a football to be magnified up to the size of the earth, each constituent molecule being magnified in the same proportion. The magnified structure would be more cross-grained than a heap of small shot, but probably less cross-grained than a heap of footballs."

HIS ATOMIC HYPOTHESIS.

Not content with measuring atoms, he would tell us how they are formed. For centuries after Democritus suspected their existence they were supposed to be hard, solid pellets, until Hobbes raised the question whether they might not be simply modes of motion in a fluid occupying space, and Malletbranche ("Recherche de la Verité" 1712) suggested that they were "petits tourbillons," or vortices. When in 1867 Lord Kelvin saw the experiments of his friend, Professor

LORD KELVIN TWENTY YEARS AGO.

(From a photograph by Fergus, Largs.)

* Paper read at the British Association Meeting, Bath, 1892.

P. G. Tait, on "Smoke Rings," such as issue at times from the funnel of a locomotive or the lips of a smoker, in illustration of Helmholtz's investigations of vortex motion in a liquid, he discerned in the flying whirls of vapour ejected from the experimental mouthpiece a type of motion, which, occurring in a frictionless, incompressible, and primordial fluid, might account for all the known properties of matter. Once created, such atoms would continue to exist through all the combinations and dissociations of chemistry, until they were destroyed by their Maker. This, I believe, is the darling hypothesis of Lord Kelvin; and according to Professor Ewing of Cambridge, he was once heard to avow that he regarded the time he spent on other subjects as in a manner wasted.

THE WORLD YOUNG AND SOLID.

Some of his deductions from the dynamical theory of heat are of an important character. In showing that the earth was once a red-hot ball some twenty or thirty million years ago, he imposed a serious check on those geologists and Darwinians who demanded unlimited time for the development of the earth's crust, and the different species of animals. One of his experiments to demonstrate that the globe has a solid and not, as was believed, a fluid interior, is worthy of Columbus. He takes two eggs, one hard boiled, the other raw, and after suspending them from cords, sets them spinning like the earth. In a short time the raw egg comes to rest, but the boiled one spins on as merrily as before; and hence he infers that if the earth had a liquid core it would soon be stopped by its internal friction.

HOW DID LIFE BEGIN?

"How, then, did life originate on the earth?" he asked in his memorable address as President of the British Association at Edinburgh in 1871, and his answer is one of the best samples of his popular style: "Tracing the physical history of the earth backward, on strict dynamical principles, we are brought to a red-hot melted globe on which no life could exist. Hence when the earth was first fit for life, there was no living thing on it. There were rocks, solid and disintegrated, water, air all round, warmed and illuminated by a brilliant sun, ready to become a garden. Did grass and trees and flowers spring into existence in all the fulness of ripe beauty by a fiat of Creative Power? or did vegetation, growing up from seed sown, spread and multiply over the whole earth? . . . When a lava stream flows down the slopes of Vesuvius or Etna it quickly cools and becomes solid; and after a few weeks or years it teems with vegetable and animal life, which for it originated by the transport of seed and ova, and by the migration of individual living creatures. When a volcanic island springs up from the sea, and after a few years is found clothed with vegetation, we do not hesitate to assume that seed has been wafted to it through the air or floated to it on rafts. Is it not possible, and if possible is it not probable, that the beginning of vegetable life on the earth is to be similarly explained? . . . We must regard it as probable in the highest degree that there are countless seed-bearing meteoric stones moving about through space. If at the present time no life existed upon this earth, one such stone falling upon it might, by what we blindly call *natural* causes, lead to its becoming covered with vegetation. . . . The hypothesis that life originated on this earth through moss-grown fragments from the ruins of another world may seem wild and visionary; all I maintain is that it is not unscientific."

ENDLESS PROGRESS THROUGH ENDLESS SPACE.

The sun and its system were, in his opinion, originally formed by the collisions of meteoric stones or defunct planets, as imagined by the illustrious La Place, and he has calculated the conditions of the genesis. In course of time as these bodies cool down they too will die, as poets from Ossian to Lord Byron have prefigured. Indeed, according to his theory of the dissipation of energy, the entire universe would come to a state of rest and death, if it were finite and left to obey existing laws. But as it is impossible to conceive a limit to the extent of matter in the universe, "science points rather to an endless progress, through an endless space, of action involving the transformation of potential energy into palpable motion, and thence into heat, rather than to a single finite mechanism running down like a clock and stopping for ever. It is also impossible to conceive either the beginning or the continuance of life without an overruling creative power, and therefore no conclusions of dynamical science regarding the future condition of the earth can be held to give dispiriting views as to the destiny of intelligent beings by which it is at present inhabited."

HIS PUBLIC WORK.

In conjunction with his studies Lord Kelvin has led an active public life. The six months' holiday of the University and the liberality of the Senate have enabled him to exercise his practical ability in numerous ways and in different countries. As a token of his appreciation of this privilege he has founded a Thomson Scholarship of experimental physics in connection with his class; but a better compensation is the glory of his name, which has attracted students to the University from all parts of the world. Amongst his miscellaneous work I may mention that as an examiner at Cambridge he, as well as Clerk Maxwell, infused a new life into the mathematical teaching there, and established the science tripos. His telegraph work has already been referred to, and of late years, since the introduction of the telephone, electric light, and electric power, he has been exceedingly busy as a consulting engineer for public companies engaged in these businesses. In 1891, for example, he was appointed president of the International Commission for the purpose of deciding on the best way of utilising the water power of Niagara, and the present year will see the opening of that daring enterprise. Lord Kelvin is often called upon to act as a scientific expert or witness in questions of patent right, as a member of Royal Commissions and scientific committees, a juror at Exhibitions, and so on.

NOT A HOME RULER.

Besides his duties as President of the Royal Society he often presides and speaks at the meetings of other, but especially scientific, corporations. For many years he has taken an active interest in politics, and his views on Home Rule may be gathered from a speech he delivered at a dinner in celebration of the Jubilee of the Telegraph six years ago: "I must say there is some little political importance in the fact that Dublin can now communicate (by telegraph) its requests, its complaints, and its gratitudes (laughter) to London at the rate of 500 words per minute. It seems to me an ample demonstration of the utter scientific absurdity of any sentimental need for a separate parliament in Ireland." (Laughter and applause.) As a member of the Upper House he will doubtless vote against Mr. Gladstone's Home Rule Bill on some principle of Conservative dynamics or rather statics.

HONOURS AND DISTINCTIONS.

Lord Kelvin has enjoyed all the prizes of a scientific career. Social distinctions which "able" men court, if they do not seek, have been showered upon him as he ran his course. His inventions have been rewarded with riches, his learning with academic honours, his public services with rank and station. His triumphs have been fairly won, and nobody who knows the man, or his Herculean labours, will begrudge his trophies. His merit is of that transcendent order which towers above rivalry, and never arouses envy unless it be in the breast of some conceited ignoramus. We shall only enumerate a few of his titles and decorations. He is an M.D. of Heidelberg, an LL.D. of Cambridge, a D.C.L. of Oxford, a past-President of a great many learned societies, including the Royal Society of Edinburgh, the Institution of Electrical Engineers, and the British Association for the Advancement of Science. In 1891 he was elected to the Presidency of the Royal Society of London, which since the time of Newton has been the highest professional honour to which a British man of science can aspire. He is a Foreign Associate of the Academy of Sciences, Paris, and an honorary member of similar bodies in other countries. He is a Grand Officer of the Legion of Honour, the highest distinction in France save one which is reserved for princes and the most illustrious public personages; a Knight of the Ordre pour le Mérite of Germany, and a Commander of the Order of Leopold of Belgium.

HIS PEERAGE.

At the beginning of 1892 he was raised to the peerage by Her Majesty; and his elevation, so richly deserved, was hailed with lively satisfaction by his scientific brethren, who regarded it as a public compliment to the pursuit of science. The style and title he assumed was that of Baron Kelvin of Netherhall, Largs. It was happily chosen, although electricians were at first inclined to regret the loss of the familiar "Thomson." Netherhall, his country seat, on the coast of Ayrshire, is a fine mansion built by himself and replete with modern improvements. The Kelvin is a beautiful and romantic stream which rises in the Campsie Fells, and after flowing past the grounds of the new college—the far-famed "Kelvingrove" of the old song—falls into the Clyde near Partick. Clear and wimpling at its source, the river is hopelessly polluted with dye-stuffs and other abominations in passing through Glasgow, and it is to be hoped that Lord Kelvin, if only for his name's sake, will make a strong endeavour to redeem its lost purity.

HIS HOUSE AT GLASGOW.

The new college on Gilmore Hill, at the west end of Glasgow, is shown in the frontispiece. It was designed by Sir Gilbert Scott, R.A., and publicly opened in 1870. The course of the Kelvin between the college grounds and Kelvingrove Park can be traced under the bridge in the foreground, close to the museum and an old model of Watts' engine. Lord Kelvin's house—which, as may be imagined, is provided with every scientific luxury and convenience, such as the electric light, the telephone, pipe-heaters and astronomical time—can be seen on the extreme left. The natural philosophy department is situated near at hand, in that portion of the college front immediately to the right of the western archway, the class and apparatus rooms being on the upper and the physical laboratory on the ground floor. The routine work of the class is undertaken by Dr. James Thomson Bottomley, F.R.S., a distinguished nephew of Lord Kelvin, and the other assistants. Only on certain days a

week and on certain subjects does Lord Kelvin lecture, and it is chiefly the advanced students who profit by his instruction. A large number of the elementary class are Divinity and Arts students having little or no interest in science, or special capacity for it, beyond learning the modicum prescribed for taking their degree. Some, in fact, are wild Donalds from the hillsides and raw Sandies from the plough-tail. What they require is, to be led on by easy steps to a clear and simple understanding of the subject, with the requisite calculations and experiments.

HIS LECTURES AT THE UNIVERSITY.

The Pegasus of Lord Kelvin is not well broken to a crawling pace, and is fain to spurn the trammels of a baby or a donkey cart and soar into his native ether, where few can follow him. Many years ago, during a course of lectures on Magnetism, his characteristic definition of an ideal magnet as "an infinitely long, infinitely thin, uniform and uniformly and longitudinally magnetised bar," was received by the back benches with a loud demonstration of the feet which drew forth a sharp "Silence!" from the Professor. Before the end of the session the definition had been repeated so often, to the accompanying tramp of their feet, and the reprimand had become so much a part of it, that one day, when, through accident or design, the students failed to respond, Lord Kelvin cried out "Silence!" all the same. The inspiration of the master mind is lost on such hearers, and the daring flights of his erratic imagination, the diversity and fulness of his knowledge, his passionate denunciations of all that is irrational and blind, are apt to be regarded by them as so much wasted time. When, by the intensity of his feelings, or the eccentricity of his genius, he shoots away from the point, and roundly condemns the "unhappy British inch," when he dotes upon his ideal vats and fluids, or bandies incredible millions of suns and moons about with all the legerdemain of a Cinquevalli, when he rushes into the midst of his artificial molecules, or dances away with the "Sorting Demon" of Maxwell, the incorrigible back benches, if they be not diverted, are prone to become uproarious.

HIS INFLUENCE AS AN EDUCATOR.

Sometimes one of his marvellous dissertations, the spontaneous utterance of his mind, would burst forth like the brilliant stars of a rocket at the very close of the hour, when the bell was ringing for another class, and the sea of touzled heads before him, some of which were as empty of the matter as a New Zealander's, had grown so stormy with impatience that he would have to lift his voice and cry above the din. These original digressions and impromptu perorations, containing the priceless jewels of his discourse, were simply flung away on all except the abler and wiser scholars, who listened with a rapt attention to the flashing torrent, the impetuous cataract of his genius. They enjoyed the rapid medley of bright ideas, invaluable precepts, and sublime speculations, often expressed in eloquent phrases that stuck in the memory as the true romance, the grander poetry of Science; and it is still a matter of regret to some that no record has been kept of them for the edification of posterity. I can only remember one as I write. He was speaking, I think, on the far-reaching influence of stresses or vibrations, and suddenly exclaimed, "I lay this piece of chalk upon a granite mountain and it strains the whole earth!" Lord Kelvin's merit as an educator lies not so much in the elucidation of well-known facts as in the spiritual influence of his magnetic personality. A minor physicist, more on a par with the

average freshman, may, by talent and cultivation, prove an admirable teacher of science, but he is unable to inspire the student with hero-worship by presenting to him the living standard of a really great mind. To the superior pupils of his class Lord Kelvin is a revelation of what a genuine man can do. There is something god-like in his profound intellect and tireless energy. The sincerity with which he labours, as though science were the all-in-all, is of itself a never-to-be-forgotten lesson. They catch his enthusiasm, emulate his activity, and some even ape his manner. There are eminent men in every part of the world who owe their success in life to the contact electricity of Lord Kelvin.

HIS METHOD OF WORK.

At the conclusion of his lecture he was wont to pay a visit to the laboratory and superintend the experiments of the students. After that, he would run down to White's workshop in the town and give directions about his inventions, or, unless otherwise engaged, retire to his study beside the class-room, and dictate scientific papers to his secretary. It was not unusual for him to continue this work until the small hours of the morning. Alone in the deserted college, save for the companion of his vigils, he would sit by the fireside, with a cigar in his mouth, reading the ponderous tomes of some old philosopher laid upon his knee, or thinking out some difficult problem, while now and again a look of deep satisfaction would overspread his countenance. His physical is almost on a par with his mental enterprise. Notwithstanding his profound knowledge of the laws of inertia, rather than lose a train he has been guilty of jumping into it while moving, in defiance of the angry porters, who threatened to put him in the "Stone Jug." It has been wittily suggested that his lameness was really a blessing in disguise, else but for that he might have attempted to fly in the air and broken his neck. Sometimes he was accorded the privileges of his fame with a better grace, as when in crossing to Belfast in his yacht, and being anxious to get sooner into the town, he hailed a chance excursion steamer filled with Irish lads and lasses, and was taken on board with all his party. On his offering to pay for the band, the captain of the steamer replied with conscious pride, "Nothing from you, sir."

AND PLAY.

In summer he loves to cruise in his sailing yacht, the *Lalla Rookh*, wherever the calls of business or the humour takes him—from Madeira to the Levant, from the Hebrides to America. On one occasion Professor Von Helmholtz was amongst the guests on board, and the *savants* by way of pastime began to give each other scientific conundrums of the most puzzling sort. It was observed by my informant, Professor Hill, of Washington, U.S., that while Kelvin and Helmholtz solved about the same number of the problems, the Irishman was quicker with his answers than the German. With great powers, otherwise equal, quickness gives the advantage, especially in practical affairs. In truth, Lord Kelvin thinks with an electrical rapidity. He does not appear to weigh and reason like most men, but to reach his results by pure intuition.

AN ELECTRICAL MIND.

This peculiarity is in agreement with a definition of genius by Mr. Francis Galton, which on the whole is singularly applicable to Lord Kelvin. "It appears to me," he remarks in his "English Men of Science," "that what is meant by genius, when the word is used in a special sense, is the automatic activity of

the mind, as distinguished from the effort of the will. In a man of genius the ideas come as by inspiration; in other words, his character is enthusiastic, his mental associations are rapid, numerous and firm, his imagination is vivid, and he is driven rather than drives himself. All men have some genius: they are all apt under excitement to show flashes of unusual enthusiasm, and to experience swift and strange associations of ideas: in dreams, all men commonly exhibit more vivid powers of imagination than are possessed by the greatest artists when awake. Sober plodding will be quite another quality, and its over-exercise exhausts the more sprightly functions of the mind, as is expressed by the proverb, 'Too much work makes a dull boy.' But no man is likely to achieve very high success in whom the automatic power of the mind, or genius in its special sense, and a sober will, are not well developed and fairly balanced."

CHARACTERISTICS.

Lord Kelvin is gifted with a very keen perception. Few things escape his notice, although he may not seem to observe them. His memory is uncommonly retentive, his reasoning faculty most clear and precise, and his imagination strong and fecund. These rare endowments are all stimulated by a fervid zeal—a vehement enthusiasm for the pursuit of science. The hackneyed epithets, a "strong bias," an "inborn taste," are all too feeble to portray the irrepressible instinct, the over-mastering passion which is eternally goading him to the study of dead matter. See him engrossed in the subject of his discourse, and utterly forgetful of himself, or wild with rapture over the result of an experiment, and you will say this man was created for science, that he is a prophet or seer with a divine mission to reveal the physical laws. Finding his deepest joy in congenial labour, and so little inclined to frivolity that ordinary pleasures were in danger of proving irksome or a waste of time, Lord Kelvin has not required to cultivate a habit of perseverance and concentration. The danger has rather been that he might not take sufficient rest or diversion, and the perpetual activity of his mind in the same groove break down the bodily machine. Fortunately his splendid fund of health and energy has proved itself capable of meeting the extravagant demands of his genius. Excepting an accident on the ice, which injured his right leg, he seems to have escaped the common ailments of humanity. During his busiest period, while a widower, he would work all day at a white heat, so to speak, yet he seldom or never appeared to tire, and a few hours of sleep were in general sufficient to recuperate his powers.

"LATE AGAIN, SIR WILLIAM."

In addition to his academical duties, his cable work and his inventions or experiments, he was then engaged on several books, including his "Natural Philosophy," and spent so much time at the college that his meals became very irregular, and a grey parrot, "Dr. Redtail," which he had brought from Brazil, used to greet him with the remark, "Late again, Sir William." At length the evil became so desperate that he gave orders for his luncheon to be on the table at a fixed hour, whether he was there or not! He is too alert to be called "absent-minded" in the ordinary sense; but the story goes that he once fell asleep in his chair while presiding at a public dinner in Glasgow. No doubt he was cruelly overworked, but perhaps the banquet was not so lively as it might have been. In the midst of his most practical and profitable employments, the old charm for some theoretical subject will revive and take entire possession of him for several

ays, holding him spell-bound. This waywardness of genius is perhaps a relief to the mind, and by changing the current of his thoughts may act as a recreation. Alternations of physical with mental exertion have also tended to promote his health in lieu of outdoor games and field sports. The study of the winter session was corrected by the travel of the long summer vacation.

INTOLERANT OF METAPHYSICS.

Lord Kelvin is so devoted to science that he may appear to neglect other matters, until by some casual remark we are surprised at the extent of his acquaintance with them. He is so accustomed to impart learning, rather than receive it, that we are apt to think it is born in him. He is preternaturally quick to learn, and seems to imbibe knowledge with the air he breathes, or by the pores of his skin. His sympathies with the older studies have not been undermined by the new, and he maintains the importance of the classics, as well as of logic and moral philosophy. If he is intolerant of any branch, it is metaphysics, and in his lectures he occasionally comes down heavily on it. The active nature of the man is antagonistic to all wool-gathering and idle dreaming. He takes to life as a duck takes to the water, and never preaches or philosophises about it. If he questions his existence at all, and moralises on his aims or conduct, it is only at odd moments, and the result is kept a secret.

Great mathematician as he is, Lord Kelvin, like the illustrious Ampère, is easily confused by simple sums in arithmetic; and in recollecting his repeated mistakes in addition or subtraction on the blackboard, and the vindictive pleasure of the class in calling his attention to them, I am reminded of a sentence in Lord Lytton's "What Will He Do With It?": "Notable type of that grandest order of all human genius, which seems to arrive at results by intuition—which a child might pose by a row of figures on a slate—while it is solving the laws that link the stars to infinity."

THE MASTER OF APPLIED SCIENCE.

Where the intellect is so predominant and impressive the real character is not very easily seen. Lord Kelvin is unquestionably a man of high honour, independent judgment, honesty, truthfulness, and sincerity. A philosopher, he is resolute and decided; a genius, he is orderly and business-like, careful of details, liking to dot his i's and stroke his t's. The purist in science may lament the time he has given to inventions or engineering, and hint that his rare philosophic genius, like the pure waters of the Kelvin, has been soiled by commerce: but his integrity is never impugned. Theory is the soul of practice, and if the soul is higher than the body, the one without the other is of little use in this world. Day by day the importance of applied science is becoming more manifest, and Lord Kelvin is typical of his age in covering the whole field. I suspect that his characteristic energies required an outlet in practical life. That, like other inventors, and even poets such as Lord Tennyson, he sold his inventions for the highest terms he could get, is hardly a reproach in our time.

HIS MODESTY.

His manner is unaffectedly natural. He assumes no airs of genius or superiority, and is singularly free from haughtiness, conceit, or even self-consciousness. He exhibits none of the vanity and cocksureness with which the average young professor bristles like a hedgehog. When facts are against his opinion or hypothesis, no false pride restrains him from sacrificing it, and owning his mistake, whether in public or in private. A trifling

dispute on the vanishing point of a picture arose between him and Professor Fleeming Jenkin one day, and four months afterwards he owned that he was in the wrong. Some years ago he recanted his doctrine of the internal fluidity of the earth. He is far above the common weakness of magnifying his work, or of taking credit for the achievements of others. Scrupulously careful to give honour where honour is due, the danger is rather that in his delight and enthusiasm over a novelty he may unduly praise it. The original observations of his assistants and students, although made in the course of experiments promoted by himself, are never appropriated by him, but always generously accredited to them, and apparently with more pride and pleasure than if they had been his own. I shall never forget his boyish enchantment in listening to a simple and popular lecture on Centrifugal Force. He could hardly contain himself, but ever and anon energetically clapped his hands, and cried out, "That's very fine!" His reverence for the great scientific names of old, as well as of to-day, and his own genuine modesty are beautiful and charming things to see. Looking further into the mysteries of nature than other men, and realising how little we know, he is animated by the spirit of Newton, who compared himself to a child picking up pebbles by the shore of the immense ocean of truth. When, on the Graduation Day of 1891, the students of Glasgow offered him their congratulations on his election to the Presidency of the Royal Society of London, and thanked him for his uniform courtesy and kindness, he placed himself on their own level. "While you have shown your sympathy with me," he said, "I wish to express my sympathy with you. I have been a student of the University of Glasgow fifty-five years to-day, and I hope to continue a student of the University as long as I live." He takes a warm interest in his old pupils, greeting them heartily, and showing pride in their achievements. They, on the other hand, never forget him, and if in the battle of life his lucubrations on dynamics have gone the way of all knowledge, his lovable traits continue to refresh their hearts, and his example to inspire them.

HIS SYMPATHY AND KINDLINESS.

With an intellect deep and subtle as the sea, and a vast, though professional, experience of the world, there is, nevertheless, a certain childlike innocence and simplicity in Lord Kelvin which, if not a mark of true genius, is often found along with it. A small and vulgar nature, cunning in worldly wiles, might perhaps impose upon him—for a time, at least. Genius, with its superior insight and highly-strung temperament, is liable to a certain intolerance of mediocrity and its ways, and Lord Kelvin appears as sensitive to a blunder in mechanics as a musician to a jarring note; but if his eager spirit grows impatient of stupidity or clumsiness on the part of a student or a workman, it is only for a moment, and is never offensive. His little frets of annoyance are quickly appeased, and often end in a sweet and captivating smile. He evinces an extreme sympathy with pain, and I well remember his unfeigned concern when a student ran a gouge into his hand one day in the laboratory. A sensibility so acute may lead to embarrassing circumstances, and it sometimes happened that in hurrying to catch a train against time he would keep thrusting his head out of the cab and urge the cabman to "drive faster!" only to shrink back in evident distress at the resulting crack of the whip. His kindness to dumb animals is well known, and he has more than once taken a public part in preventing their ill-usage. Many

years ago he possessed a little black-and-tan terrier called "Fanny," which he treated with infinite tenderness. "Fanny" did her best to advance electric science by furnishing the black hairs which he employed in the gauges of his electrometers. I have been told by Mr. John Tatlock, formerly his lecture assistant and secretary, that one day when a guest on board his yacht levelled a fowling-piece at a sea-bird, he became white with indignation, and arrested the shot by seizing the sportsman's arm.

The highest genius from its nature is, and must be, in a measure lonely; hence Lord Kelvin is at times pre-occupied with his studies, but for all that he is of a sociable turn, and fond of company. He enjoys a good dinner, and is not above the humours of a comic song. Indeed, he has perpetrated more than one joke himself. "When is blotting-paper—blotting-paper?" he asked one day of a fellow Professor. "I give it up," was the reply. "Never!" he cried in great glee.

HIS PORTRAITS.

The portraits of Lord Kelvin which accompany this article were taken at different periods of his life by Mr. Fergus, of Largs, and are very like him. The face, with its Scotch and Irish traits, is characteristic of the depth, solidity, and brilliance of his mind. The forehead, in particular, is very remarkable, and its intellectual power is unmistakable. His is one of those heads which may be described as all brow. Prominent over the eyes, where the ideomotor faculties are believed to reside, the dome recedes upward to the crown, and then falls to the neck without any protuberance behind. His eyes have the inscrutable depth so often seen in men of genius. In colour they are blue-grey, and his hair is a fine, soft brown, inclining to curl. Of a Scotch build, his figure is tall, sinewy, and athletic, with little or no tendency to stoutness. Although somewhat near-sighted, and the snows of well nigh seventy winters have blanched his head, the volcanic fire of his energy is far from extinct; his step, in spite of the short limp, has even now the spring and buoyancy of youth, and to all appearance there are many years of useful activity before him.

PRIZE CALENDAR FOR JUNE.

- FIRST Prize is won by W. Culling Gaze, Fengate, Peterborough.
2. Miss Cécile Lambert, 27, Blenheim Crescent, W.
 3. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.
 4. Miss Sarah Lukes, Clifton House, Par, Cornwall.
 5. "Polyearp," Alresford, Hants.
 6. Miss Elise Hugnet, Green Cliff, S. Martin, Jersey.
 7. J. L. Keeling, Staponhill, Burton-on-Trent.
 8. Miss N. Edwards, Park Farm House, Eltham, Kent.
 9. Miss Rachel F. Thompson, Castle Hill House, Settle, Yorks.
 10. Charles D. Rosling, Horwell School, St. Stephen's, Launceston, Cornwall.
 11. George F. Wright, Ings Road, Burton-on-Humber.
 12. "Mackintosh," Southfield, Leominster, Herefordshire.

Loss of Horses in War.

THERE is an interesting article by Veterinary-Captain F. Smith in the *United Service Magazine* on this subject. War is bad for men, worse for horses, but worst of all for bullocks, camels, and elephants. As with men, so with horses; more die from disease engendered by the campaign than by lead or steel. Mortality of horses in a

A REALLY GREAT MAN.

Baron Kelvin is one of those extraordinary men who are bound for greatness as the sparks fly upwards. Doubtless the time and place of his birth were favourable to him, but under any circumstances he would have risen to pre-eminence. He appears to have every requisite for the highest success—power of will, superabundance of intellect and energy, as well as a good measure of all the virtues, and religious faith. In him we are able to see what a really great man is like. His supreme ability is never disputed by any one who knows him or his work. Indeed, all who come in contact with him, from the prince to the workman, are apt to fall under its commanding influence. Even a duke would find it natural to serve him; and it is common enough to see him in the middle of a group of distinguished men as a planet is surrounded by its satellites, or rushing ahead of them like a fiery comet followed by its tail.

THE NAPOLEON OF NATURAL PHILOSOPHY.

Such prodigies of nature are only produced at rare intervals, and it may be a long time before the world has another scientist of his calibre. It will be easier to estimate his true place and proportions hereafter from the standpoint of distance. Apparently, however, his name will go down to posterity with those of Galileo, Newton, and Pascal. So far he is unique in science by reason of his multifarious and diversified career. His achievements would suffice to make at least three eminent reputations, for not only is he the greatest physicist of the day, but the leading electrical engineer, and one of the most celebrated inventors. Our wonder at the manifold lines of his activity is increased when we reflect that all of them are interwoven in a single piece. I would name him the Grand Old Man of Science were it not that from a political feeling he might scorn the comparison. Let us call him the Napoleon of Science, or—if the older fashion be more to his taste—the Napoleon of Natural Philosophy.

J. MUNRO.

campaign is usually heavier than that of men. Napoleon in 1812 entered Russia with 187,000 horses; he came out with 16,000; he lost 10,000 in a few days after he crossed the Niemen, owing to foddering them on young growing crops. Starvation is one of the worst sources of equine mortality.

In the Crimea, during the six months' winter, 1854-55, we lost from starvation 47 per cent. of the horses of the Heavy Brigade, 38 per cent. of the Light Brigade, 42 per cent. of the Artillery, and 38 per cent. of the Transport!

He compiled the following statistics as to the proportion of the loss of horses and of men in cavalry, and in the artillery. In the campaign he reckons the War Office would be prepared to replace from 17 to 20 per cent. of their entire number of horses:—

1691 to 1799, for every 100 Cavalrymen disabled there were 148 horses	
1800 to 1865	121 "
"	133 "
1866 to 1870	113 "
"	133 "

Taking the war of 1870-71 as a type, we learn that from Weissenbourg to Sedan—

For every 100 Cavalrymen disabled there were 120 horses	
" 100 Artillerymen	142 "

THE MATTEI TREATMENT OF CANCER CASES.

REPORT ON THE SECOND YEAR'S TEST.

IT is just a year since the first stage of the Mattei experiment terminated with a negative report from the medical committee which had been constituted to watch the five test cases. That committee reported that, it will be remembered, we had five patients, each of whom had been certified by two competent physicians, and accepted as unmistakable cases of the malignant disease by the members of the committee and their able and zealous registrar. When the committee drew up its report just twelve months ago they declared, as the result of twelve months' observation of the cases, that there had been no improvement, and that the cancerous disease had steadily advanced in all five cases. In one case the advance had been slow but perceptible, in three moderately rapid, while in the fifth the progress of the disease had been very rapid. The committee declare, as the result of accurate observation taken of the local condition of the disease, that in all cases the patients were markedly worse. They admitted, however, that what appeared to their scientific eye as incontestably true as to the progress of the disease was opposed to the impressions of the patients themselves, each and all of whom gave a favourable account of their feelings, and felt that they had received benefit.

That marked the conclusion of the first stage of the experiment. None of the patients were cured, in all the objective symptoms were worse; but all the patients believed they were benefiting by the treatment. The report was not finally conclusive, but I accepted it hyally as disposing of any reasonable belief in the probability of curing malignant cancer by medicinal remedies.

The committee, having arrived at this result, was dissolved in fact, although not in form, and the second stage of the inquiry began, in which the services of the committee were no longer necessary.

Writing in September last year, I pointed out that so far as the test had then gone I accepted the report of the committee as to the failure of the remedies to cure cancer, but I as loyally accepted it when it certified that the patients said that the remedies have removed the suffering and lengthened their lives. The evidence up to that point seemed to show that the Mattei treatment would not justify any cancer patient in expecting to be cured, but that it would diminish the local pain, improve their general health, and enable them to make the most of the life that was left to them. Therefore, in the second stage of the inquiry I merely undertook to report as to whether or not the admitted success of the remedies in remedying and alleviating the subjective symptoms was continued to the end. From a scientific point of view the experiment no longer concerns the recovery of the patients. It is confined solely to the question whether or not the treatment makes dying of cancer a tolerable instead of an intolerable mode of quitting life.

As to the subjective symptoms, it is well to remember that the patient is the only authority on the subject, and in ascertaining whether or not the remedies alleviate pain, the evidence of the patients themselves is the only testimony worth taking. It will be seen that they all tell the same tale, and that without any exception they persist in asserting that they have been benefited by the treatment to which they have been subjected, and in which they still have unshaken faith.

The following statements have been addressed to me

from four of the patients, one of the five having succumbed in the course of last month. This unfortunate patient since the beginning of the treatment had suffered from two attacks of influenza, a disease which, to say the least, did not tend to facilitate the cure of the cancer. Of course Count Mattei never claimed to be able to cure every case of cancer, and the fact that one of the five patients has succumbed is only conclusive, however, as to the inability of the remedies to cure that particular case. But the inquiry in the second stage is not concerned with possibilities of cure, but solely with the efficacy of the remedies to alleviate the pain and minister to the happiness of the sufferers from this terrible disease.

The nurse who attended Mrs. B. as she neared her end, writes as follows:

Mrs. B. had a very quiet death. I found the blue electricity very good, five drops on a wet pad stops palpitation. Two drops in a little water taken inwardly relieves pain in the breast.

The other patients, including one in whom the cancer was reputed to be making rapid progress, all report themselves as benefiting by the treatment up to July 28. As before, I only use the initials of the patients.

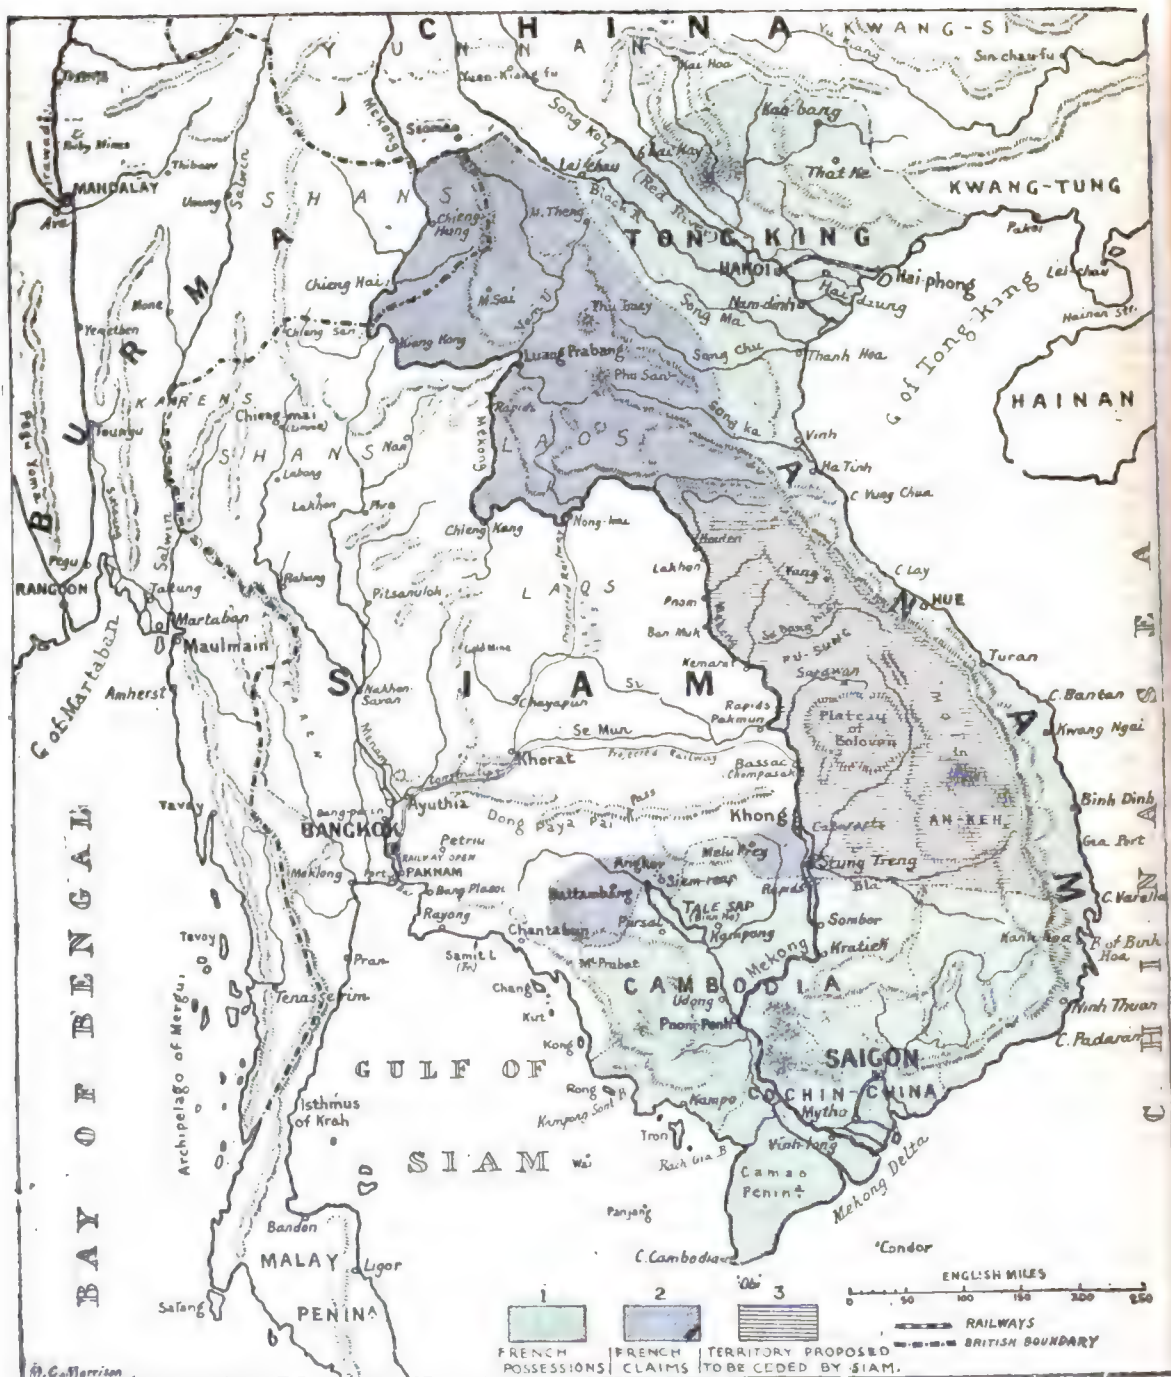

J. L. writes:—"I am pleased to tell you that my general health is good, that the cancer in my breast is causing me no pain, and that I am perfectly able to discharge my household duties. I am very thankful for the Mattei treatment, which I think in my case has answered exceeding well."

M. R. writes:—"The continued heat of this summer has made me feel at times very weak and poorly, but on the whole I keep fairly well considering the severity of the disease from which I am suffering. I am able to attend to many light duties at home. During the hot weather I have suffered with hot burning pain, accompanied by inflammation, but I always find relief by applying a lotion of Augeo, with a little blue electricity. When the pain is sharp, green electricity gives immediate relief, and I also find it does good to take a few drops of it in water."

M. A. M. says:—"The Mattei remedies have given me great relief, and my health has considerably improved. I have every faith in the treatment."

C. L. reports:—"I am pleased to say that I remain in quite as good health as I did when writing last. As I then stated, my health has greatly improved since using the Mattei remedies. I used to suffer from poor health and severe indigestion. I still have no pain from the cancer, and am not troubled by it."

These letters are clear enough. Admitting, as the doctors would tell us, that the patients are no judges of the progress of their disease, they at least are the best authorities as to the extent to which they suffer or are free from suffering. So far as the test cases go, they certainly appear to justify all that has been done to bring the remedies before the attention of the public. To those who may be disposed to deny that any good has been achieved, because the alleviation of agony has not also been accompanied by the cure of the disease, it is enough to say that they evidently have never known what it is to nurse any one dying of cancer. A remedy which would enable all cancer patients to die painlessly would be a greater boon to the world than a medicine which cured 10 per cent. of the cases and left the other 90 per cent. to suffer without any alleviation of their torment.

THE CRISIS IN SIAM.

LEADING ARTICLES IN THE REVIEWS.

ENGLAND, FRANCE AND SIAM.

OUR RISKS, RIGHTS, AND RESPONSIBILITIES.

MR. GEORGE CURZON, writing in the *Nineteenth Century* "India Between Two Fires," pleads for the careful reservation of buffer States, for the safety and tranquillity of India. He thus summarises the story of the French attack upon Siam:—

HOW IT BEGAN.

The French have had disputes and conflict with the Siamese. Claiming a large extent of territory (adjoining their protectorate of Annam), which up till a few years ago was coloured in their own official maps as Siamese, which is inhabited by people of the Siamese stock, and which has been occupied by Siamese troops and administered by Siamese governors during the greater part of the present century, they anticipated the discussion and delimitation that were innocently proffered by the Siamese Government by the despatch of a series of marauding expeditions, which proceeded to expel the various Siamese posts and to annex the entire country in dispute.

THE ULTIMATUM.

When in the course of these operations, one Frenchman was killed and another taken prisoner, they abruptly shifted the scene of action to a larger stage, seized a number of islands in the Gulf of Siam, moved the French fleet to Bangkok, and, in despite of assurances, pledges, orders, and treaties, forced with two gunboats the passage of the Menam river, and menaced the capital. From this vantage-ground they then hurried at the head of the Siamese monarch an ultimatum, the severity of which excited the indignation and pity of all civilised observers. Exorbitant pecuniary indemnities were required; and at the same time that M. Develle was assuring the French Chamber and the British public of his sympathetic regard for the integrity of Siam, she was called upon within forty-eight hours to submit to a territorial dismemberment, of which, as I write, it is still doubtful whether it involves the surrender of one fourth, or of one half of the entire Siamese dominions.

HOW IT AFFECTS US.

If the French demand for the cession of the left bank of the Mekong be held to apply to the entire course of that river from China to Cambodia, such appropriation, quite apart from its wanton and exorbitant character in relation to Siam, would materialise and call into existence those very British responsibilities which I have argued that even informal buffer States have the tendency to create. No British Government can acquiesce in an arrangement that would involve the cession by Siam of States which became British by the conquest of Burma, and have only been ceded to Siam by ourselves, subject to a condition that they shall not be handed over to any other power. No British Parliament can tolerate the wholesale extinction of a great and yearly increasing British trade with Yunnan and the provinces of South-west China. No section of British public opinion can desire that the buffer State should not merely be crippled, but squeezed out of existence, and that possible rivals, such as England and France, should be planted face to face in the distant recesses of the Asian continent, with nothing but a river or a malarial forest strip to separate them. France is on the brink of occupying—she is frankly desirous to occupy—such a position. Let our eyes not be shut to the fact.

WHAT WILL CHINA DO?

MR. D. C. BOULGER, writing in the same Review, thus discusses the probability of Chinese intervention:—

It is possible that the desire to recover what was lost in Tonquin may operate as an inducement in the eyes of Chinese statesmen to act with exceptional vigour in regard to Siam, which has special claims on their consideration. In the first place, Siam has paid tribute to China every three years for at

least six centuries; and in the second place, one of the most flourishing Chinese colonies is located in that country. It has been estimated that half, and the richest and most prosperous half, of the population of the Menam Valley is Chinese; and, considering this fact, it is not surprising that an ancestor of the present Chinese Emperor should have specially named it "The Happy State of the South." The fate of Siam is not likely to be regarded with indifference at either Peking or Canton, and France will be undecieved if she fancies that the opposition of England, whether it prove feeble or vigorous, will be all that she has to encounter. No doubt China does not yet feel sufficiently strong to be precipitate in taking up the cause of Siam by delivering to France in her turn an ultimatum, more especially as she may reasonably think that England is equally interested in the matter; but the attempt to execute M. de Lanessan's programme will sooner or later bring China into the field, and her opposition may prove more serious than the Parisians affect to believe. Every year adds to China's power for war; and our information must be singularly at fault if she has not very skilfully undermined the French position in Tonquin.

A PLEA FOR PUBLIC PLAYGROUNDS.

BY THE EARL OF MEATH.

LORD MEATH publishes a paper in the *Nineteenth Century*, pleading for the establishment of public playgrounds for children in every city. He gives the following account as to what has already been done:—

London alone has, since the formation of the Metropolitan Public Gardens Association in 1882, increased her open spaces by 157, containing 4,998 acres, whilst the entire number of public parks and gardens within easy reach of the inhabitants of the metropolis is 271, containing 17,876 acres, which include 6,380 acres acquired and maintained by the Corporation of the City of London. We may roughly say that the cities and towns of the United Kingdom, including the metropolis, possess some 500 open spaces over 40,000 acres in extent.

He points out that it does not suffice to lay out the playground. Arrangements should also be made for providing amusements for the children, and the heart of somebody ought to be pricked with remorse at being reminded that it is only in the Royal Parks of London that no public gymnasium for the people is to be found.

Years ago I remember to have seen them in Manchester and Salford. I believe now there are many in the towns of Britain. One of the first open-air playgrounds ever constructed was at Manchester; it was made and maintained by Messrs. Armitage for the use of their workpeople. Following their example, some years ago I constructed two for the use of the tenants on my property in the city of Dublin. The largest is divided by a railing into two portions, one for boys and the other for girls. It contains a giant stride, climbing mast, horizontal and parallel bars, swings, jumping-board and cat-gallows, skittle-ground, swings, skipping-ropes attached to a central post, horizontal ladder, trapeze and swinging rings, and a sandpit in which the little children dig and play, whilst their mothers and nurses can sit round on benches watching them or chatting. The other ground is too small to be divided, and is therefore on alternate days devoted to the exclusive use of boys and girls, as the case may be. A large painted board informs all whether it is a boys' or a girls' day. In each playground there is a caretaker attired in uniform. The rush of children when these grounds were first open was so great that it was almost impossible, though two caretakers were employed in each ground, to keep any order for the first week, and consequently a few accidents occurred; but since then I have had no complaint, nor have I heard of any further accident, though the grounds have now been opened for five years. They are in constant use, and, the novelty of the thing having worn off, are not so inconveniently crowded as formerly.

THE "QUARTERLY REVIEW" ON HOME RULE.

THERE is a somewhat remarkable and fairly frank article on the Unionist Campaign in the *Quarterly Review*. The reviewer naturally takes the worst possible view of the prospects of Home Rule, but he is sufficiently alive to the possibilities of the next general election to think it worth while to discuss what should be done if the constituencies were after all to decide in favour of Mr. Gladstone the second time, after the next general election. In that case the reviewer tells us frankly the House of Lords would give way, but he advises them to accompany their surrender with a demand that the Home Rule Bill should be converted into a separatist measure by the exclusion of the Irish members from the House of Commons. The reviewer differs from most people who have thought of the subject, by objecting to the referendum, holding that its object is practically secured by the House of Lords:—

We have every hope and belief that the Home Rule movement will receive its final deathblow at the next general election. Still we have to deal with a most uncertain quantity, the caprice of a half-educated and almost indifferent electorate, influenced in its judgment by personal and local considerations far more than by any logical approval or disapproval of Home Rule. Under these circumstances, it is folly to lose sight of the possibility that the Liberals may obtain a new and even larger majority on a second appeal to the constituencies.

WHAT SHOULD THE LORDS DO?

In this contingency the position of the Unionists and the attitude of the House of Lords would be materially changed. It is impossible for the hereditary chamber to place itself in permanent opposition to the declared will of the people as signified at the polls. As things are, nobody can gainsay the right and even the duty of the Lords to reject the Home Rule Bill on the ground that it has never yet really received the sanction of the country. But if, no matter on what grounds or by what devices, the country should be induced, after the rejection of the Bill, to return again a majority favourable to Mr. Gladstone and his Home Rule policy, this plea would be no longer available. Still, even in such a case, the Lords would be amply justified in making their consent to pass the Bill when presented a second time, conditional upon the exclusion of the Irish members from the Imperial Parliament, and by so stipulating they would render the leap in the dark involved in the concession of Home Rule to Ireland less hurtful and less dangerous to Great Britain than it would be otherwise.

ADVICE TO THE HOME RULERS.

The reviewer being in the good spirits natural to a man who believes that he is winning all along the line, undertakes to teach Home Rulers how they should conduct their case. He says, for instance, what is quite true, that the Unionists have attached a preposterous degree of importance to the finding of the Parnell Commission. The following passage may be commended to the attention of most of the Unionist controversialists:—

We cannot conceal from ourselves that, if the Nationalists had turned to bay and had been able to speak the truth without endangering their cause, they would have had a defence it would not have been easy to answer. That defence would have, in effect, been this: "We have been making a revolution, and revolutions are not made with rose-water. We wanted to free Ireland from Saxon rule, and we had no time to pick and choose our instruments: we, a weak, poor, and distracted country, had to overthrow the power of a strong, wealthy, and united kingdom; and not being able to take up arms, we had to carry on a clandestine warfare by underhand violence and surreptitious outrage. It is idle of you to complain because we employed the only weapons at our disposal, or to brand us as criminals because we fought our war subject to the conditions under which alone success was possible." To this line of argument we fail to see any adequate answer, if you adhere

to the commonplace Liberal theory of the sacred right of insurrection.

AND TO THE GLADSTONIANS.

Not content with telling the Nationalists how they should defend themselves, he proceeds to tell the English Gladstonians what they would say if they understood their brief; the choice of evils argument, he tells them, is the strongest in favour of the repeal of the Union, and this argument he summarises in the following sentence:—

The democracy of Great Britain will never consent to the prolonged coercion of the sister kingdom; the Irish democracy will never consent to forego the fulfilment of its national aspirations. We are brought, therefore, to a dead lock. From this dead lock there is one way of escape, and one way only, and that way is to be found in obeying the cardinal tenet of Liberalism, and in accepting the will of the Irish people as manifested by their elected representatives.

The argument is good enough; the only odd thing is that a man intelligent enough to write for the *Quarterly*, can at the same time regard this suggestion as a novel contribution which ought to be welcomed with gratitude by the Gladstonians. As a matter of fact, it has been dinned into our ears morning, noon, and night for the last seven years.

LORD RANDOLPH CHURCHILL.

There is not much else in the paper that is notable, excepting the reference to Lord Randolph Churchill and Mr. Chamberlain. Mr. Balfour is too respectable a leader for the *Quarterly*, which exults over the temporary galvanising of Lord Randolph Churchill into a semblance of life. Writing on this subject, he says:—

During the last few months, he has been constantly before the public, addressing meeting after meeting in all the leading centres of political activity, and displaying once more the marvellous power of platform oratory, the exuberant energy, and the keen sympathy with popular sentiments and popular prejudices, which raised him to such high eminence, so gallantly won, so prematurely abandoned. That a singularly clear-sighted political observer, who has been content to remain so long in comparative obscurity, should consider that the campaign against Home Rule affords him a signal opportunity for recovering his past authority, is of ill-omen for the future of the Home Rule agitation.

MR. CHAMBERLAIN.

The following tribute to Mr. Chamberlain is not undeserved:—

The honours of the after Whitsuntide Session undoubtedly belong to the Liberal Unionist leader. In debating power, in clearness of statement, in vigour of attack and skill of defence, Mr. Chamberlain has proved himself more than a match for any speaker on the Liberal side, not excluding the Prime Minister himself. To detect the inconsistencies, anomalies, and absurdities of the Home Rule Bill, has been a work after his own heart; and the result of his investigation has been made known with an almost cruel lucidity. No doubt the strength of his case has made easier the work of a consummate advocate; but in addition, the marked contrast between Mr. Gladstone's involved sentences, ambiguous explanations, and irrelevant disquisitions, and Mr. Chamberlain's clear, plain, and simple style of oratory, has contributed in no small degree to the latter's success as a Parliamentary debater. People may dispute the soundness of Mr. Chamberlain's arguments, but everybody knows exactly what he means; his words are only capable of one, and that a straightforward explanation, and his oratory is always persuasive even when it is not absolutely conclusive. Granted life and health, he stands clearly marked out as likely to attain to the highest rank of English statesmanship, though under what combination or what programme he may work his way to the front still remains doubtful.

PASSING NOTES ON HOME RULE.

THE magazines, with the exception of the *Quarterly*, have not much to say worth quoting about Home Rule. Some eschew the subject altogether. Others publish more or less perfunctory dissertations upon the subject ending for little remark.

WILL HE DISSOLVE?

The *Edinburgh Review*, in its political article, concludes by demanding that, according to constitutional practice, the rejection of the Home Rule Bill by the House of Lords should be followed by a dissolution. The reviewer says:—

According to every maxim of the Constitution, it will then be the duty of the Prime Minister either to resign or to dissolve Parliament. Upon the adoption of a "new constitution" it is for the people to decide. And we cannot believe that any desire to prolong the stay of a Ministry in office, or to seek party advantage by again obscuring the great issue upon which the country must be consulted, will be allowed to prevail over the sense of duty which in such a crisis ought to guide the Prime Minister in the advice he has to give to the Queen.

VARIOUS VIEWS OF THE GAG.

The three parliamentary papers on "The Gag and the Commons" with which the *New Review* opens, are poor. Mr. Russell's is dull. Mr. Redmayne's is chiefly interesting because of the following sentence:—

I deeply deplore the fact that any single clause of the Home Rule Bill should leave the House of Commons without discussion. A measure of this kind must be discussed in every particular before it can pass into law. If it be not thoroughly discussed now, it must be the next time; and what I feel most keenly about the whole matter is that had the Government acted sooner and acted upon different lines every single clause might have been adequately discussed by this time.

Lord Cranborne's is a trifle too exaggerated to command attention, as may be seen from the following sentence:—

Further a few more steps and we shall arrive at the system of representative institutions which exists in the black republic of Hayti, where, upon a change of Government, the practice is for the new Ministers to execute their predecessors in office.

THE COLONIES AND THE HOUSE OF COMMONS.

Sir Frederick Pollock, writing in the *National Review*, thinks that the retention of the Irish Members in the House of Commons will raise in the Colonial mind an aspiration to be represented at Westminster. Thus:—

A new and gigantic Redistribution Bill would have to be the first chapter of our new constitution for the British Empire. These difficulties, it may be said, are enormous; they are such as to show that the whole project is fantastic and unworkable. I am not at all concerned to dissent from this. It seems to me that some opportunity might as well have been allowed for perceiving and considering the difficulties before the House of Commons committed itself to a decision which, as I submit, puts the colonies quite within their rights if they choose to raise the question.

THERE is a very interesting article in the *English Historical Review* on the royal navy under Charles I. The sailor's lot in those days seems to have been very evil. Pay was in arrears, and the rations as often as not were lacking. The frightful neglect from which the sailors suffered had a great deal to do with the fact that with only one exception the entire navy took sides with Parliament against the King. Parliament paid the sailor liberally and punctually, and the sailors served it honestly and well.

THE NEXT STEP IN MEDICINE.

CURE BY SUGGESTION.

A VERY interesting paper by Dr. Myers and Mr. Myers upon "Mind Cure, Faith Cure, and the Miracles of Lourdes," appears in the *Proceedings of the Society for Psychical Research*. It is a paper full of the luminous suggestions which characterise all Mr. Myers's writings in this field. The Messrs. Myers, of course, regard the cures of Lourdes and the Christian scientists in America as so many instances of cures by suggestion; but in their hands this is no weapon against the belief in the Divine Healer. The following passage eloquently expresses what many have for some time past more or less inarticulately felt:—

We seem on the eve of one more forward step along a road which medicine has long been pursuing. Our process has as a rule been from local to general treatment; from the *application* or *affusion* of external remedies on the diseased part to the *ingestion* of remedies through the stomach, and then on to the *injection* or *infusion* of remedies through the blood. We now propose to heal the patient's tissues, not through the stomach nor through the blood, but through the brain; to utilise the controlling and innervating, as we have utilised the diffusive and the peptic power. Affusion, ingestion, infusion, suggestion. At each step we touch the ill more intimately; we call more directly upon the patient's own inward forces to effect the needed change. We seem to see the great Church, like Nile after the route of Actium, "spreading broad her breast, and with her whole robe summoning the conquered into her sea-blue bosom and her shadowy stream." But dare we press the parallel further, and say that in Science we have an Actian Apollo, armed not only with darts that pierce through error, but with rays that illumine things to come? Can any new faith, as absolute, as reverent as the old, guide, like the old, its votaries to healing of body as well as soul?

Absolute as the old the new faith might perhaps become if psychological therapeutics should win their assured place by the side of physiological; if it should be recognised that here, too, our appeal is made to no chance caprice or uncertain favour, but to inflexible and eternal Law. Then, perhaps, the most scientific man would be the most confident, and it would be the sign of wisdom to seek self-healing with the directness of a child. Or is it possible that something beyond mere logical conviction may be needed for the profounder cure; that the self-healing must needs be felt to depend ultimately on something behind and above the Self? It may be that the inmost effort must still be a religious one, and that to change man deeply it needs a touch upon that mainspring deep in man. What, then, for such a purpose, must the religion of science mean? It must mean at least the ancient acceptance of the Universe as good, the ancient sense of the individual effort as co-operant with a vaster Power. If science can regain this sense for man she may do with him what she will. For she will have united with the wonder-solving analysis the wonder-working faith, and with the wisdom of the children of this world the wisdom of the children of light.

The paper is also remarkable on account of a narrative which is vouched for by a physician occupying an important scientific post on the continent of Europe. He is a *savant* of European reputation, and he declares that his wife has been controlled by the spirit of a deceased doctor, who was a personal friend of his, also a *savant* of European repute. This eminent physician has arrived at the following professional conclusion as to the reality of such medical controls:—

You ask me whether I consider these agents as belonging to the human type. Provisionally, Yes;—unless we admit that there exists, superposed upon our world, another world of beings distinct from humanity, but knowing it and studying it as we study the other regions of nature, and assuming for the sake of amusement or for some other motive the rôle of our departed friends.

JEW-BAITING IN IRELAND.

THE FIRST NOTE OF ANTI-SEMITISM.

ONE of the most important articles in the magazines last month has hitherto escaped attention. It is entitled "The Jew in Ireland," and appears in the *Lyceum*, the monthly organ of the Jesuits in Dublin. It is the first unmistakable note of alarm that has been sounded on the other side of the Irish Sea concerning the Jews, and it must therefore be regarded as somewhat important. Ireland has had many grievances, but if she is to have a new one in the shape of a Jewish invasion, she seems likely to have a fresh misery added to her secular grievances.

THE JEW MAN OF DUBLIN.

It will be news to most of our readers to learn that the number of Jews in Ireland tends constantly to increase:—

In Dublin, where they are settling in ever-increasing numbers, they do not gravitate towards the Coombe or the Liberties. They possess themselves rather of the quarter traversed by the South Circular Road. In this thoroughfare itself, and in the streets opening off, they have established a flourishing colony—so flourishing that for their religious needs a spacious synagogue has lately been built close by. In some of the streets that open off the South Circular Road one may walk along the pavement from end to end and hardly hear a word of English spoken by the children who are at play on the footpath. We are in as completely a Jewish quarter, as if we were wandering through some city of Poland or Southern Russia.

The Dublin Jew man, like the English tally-man, is already a familiar and somewhat dreaded social figure.

THE GOMBEEN MAN.

The Jew in Ireland, as in all other agricultural countries, is worming his way into the gombeen business. The *Lyceum* says:—

The danger to Irish social and economic life which the Jew seems likely to create promises to come from his gombeen propensities. Already he has begun as a petty trader, adopting amongst us the methods which have earned him unpopularity in Germany. We may notice him traversing the lanes of our cities, or visiting our country farm-houses when the "good man" is abroad and only the women of the household have to be dealt with. He carries bundles of cheap wares, or he is laden with pious pictures, or statues of the Christian Redeemer whose name and whose following he abhors. These objects he offers at prices which secure him a respectable profit, and which appear temptingly low to the purchaser, from the circumstance that the payment is spread over a considerable time.

And so it comes to pass that the Jew gets the unfortunate agriculturist into the meshes of his net. It is certainly an aggravation of the case that he should do so by peddling crucifixes and pictures of the Christian saints "on tick" to the Catholic peasantry. The *Lyceum* points significantly to the fact that the appearance of the Jew gombeen man occurred immediately after the creation of a mortgageable security in the farmer's holding.

"HEP, HEP!" IF—?

It will be replied, no doubt, that so far the number of Jewish gombeen men in Ireland is small.

They seem, however, to be sufficiently numerous to lead the *Lyceum* to devote an article to the question as to whether or not an anti-Semitic movement should not be started in Ireland. That we are not doing the conductors of *Lyceum* an injustice may be seen by perusing the closing paragraph of this remarkable article:—

To answer according to our lights the question with which we began, "Should the Jew be made welcome in Ireland?" we reply: If he will come to take a share in our

industries, to be an honest producer amongst us, to contribute by his labour to the general sum of our wealth, let him be welcome even though the field of labour amongst us is pretty well crowded already. But if he comes merely as a parasite, not to produce by labour in the field or the workshop, but to live upon the fruits of the labour of others, which he secures by the arts of doubtful traffic and dangerous money-lending, then let him not be more welcome here than he is among the peasants of Germany or among the labourers of France.

ETHEROMANIA.

In *Belford's Monthly Magazine* for July, Dr. Alexandre Guérin, of Paris, declares that family physicians by advising the inhaling of ether to drive away headaches or to quiet the restlessness of an over-wrought nervous system, are establishing the vice of etheromania. Dr. Guérin spent some months in Ireland studying the disease. Monsieur Sauvet thus describes his experience of inhaling ether for four minutes:—

At first I felt a sudden sharpening of the power of memory: utterly forgotten facts and details came back to me with a vividness well-nigh incredible. A friend whom I kept in the room as a witness of the experiment, now pinched me black and blue without causing me the least pain. A minute later I felt I was entering the realm of delirium: a waltz sings in my ears, so entrancingly clear that I begin dancing round the room, hugging a chair as my partner. My eyes see living human beings in every design of carpet and wall-paper; now I am gazing upon the distinct outlines of a little black woman, leisurely walking up and down the piano at the further end of the room. Then the excitement grows fast, and almost furious. At the end of twenty minutes the intoxication caused by these two hundred and forty seconds of inhalation of etheric vapours vanishes, and leaves behind it with a strange weariness and almost stupor, the impression of an exquisite dream.

That is the beginning of it, but the end of it is far different.

Etheromaniacs left entirely to themselves, rapidly increase the dose, and give to their nervous system a series of shocks that are not long shattering it beyond all remedy. Some of them, under the influence of the drug, commit crimes that cause their arrest and conviction, or dissipate their private fortune with the same recklessness that induces them to throw to the winds their health, and often their reason. In many cases the life of an etheromaniac ends in shame, as well as in unutterable sorrow, for those who love him.

Etheromaniacs of a milder type, wise enough to keep their passion within bounds, invariably lose their appetite, grow thin and restless, are afflicted with insomnia, with trembling of the limbs, with failing of sight and hearing. They cease to care for either their profession or their friends, become morose and capricious in their temper—in a word, lose the very taste of life outside of the "artificial paradise" they have created for themselves at the expense of all that is noble, manly, and respected.

An Interviewing Press Association.

THE latest development of journalistic enterprise in London is the formation of what is described as the "National Interviewing Association," which has its headquarters at 117, Fleet Street, and is edited by Mr. Richard son, who, like the editor of the *Evening News and Post* and myself, is an old member of the staff of the *Northern Echo* at Darlington. The interview, in the opinion of the founders of this association, has become essential to every well conducted newspaper, but as most of the people to be interviewed live in London, provincial newspapers are at a disadvantage. Therefore this association has come into existence in order to interview political, scientific, social and industrial experts and leading men, for the benefit of such provincial papers as will subscribe to the association.

THE LOSS OF THE "VICTORIA."

BY ADMIRAL HORNBY.

Most people will turn first to the article in the *Fortnightly*, on the loss of the *Victoria*, by Admiral Hornby. It is, however, rather a slight paper; the drift of it is to minimise the feelings of dismay and of misery caused by the catastrophe. Admiral Hornby is quite sure that the best admiral in our "Navy List" could not possibly have forgotten the paramount necessity for keeping the columns of the fleet at their proper distance, excepting on the hypothesis of sudden illness. Notwithstanding the danger to which the policy of implicit obedience is liable, Admiral Hornby is certain that if the whole navy were polled, they would prefer to stick to one admiral and one order. Admiral Hornby thinks that if the *Camperdown* had turned so as to form close to the *Victoria*, astern of her or on her quarter, she would have obeyed the admiral's signal and also the signal book's instructions. No such manœuvring as Sir George ordered is to be found in the signal book, and the use of the special signals employed on that occasion seems to show how far Sir George must have been from himself. He maintains that the gridiron movement is quite safe. As to the moral of the disaster, he thinks it does not prove anything against the stability of the ship which was built in order to give seamen steady platforms from which to fight the guns in sea-way. As for the vulnerability to ramming, that also concerns him little; ships are built to ram, not to be rammed, and they ought to trust to their skill in manœuvring to avoid that danger.

Sir Thomas Symonds, writing in the same review, says that he would eliminate from the signal book all signals ordering ships to turn inwards towards each other.

Admiral Hornby does not confine himself to the *Fortnightly Review*. He has written a much better article in the *United Service Magazine*. He repeats his conviction that Sir George Tryon must have been ill of the fever; but even as it was he cannot understand how the captain of the *Camperdown* failed to avoid the *Victoria*. He is much impressed with the absence of that spirit of mutual assistance and friendly banter that used to characterise the Mediterranean when he commanded the fleet there. He says he is sure that if he had made Admiral Tryon's mistake, with hardly an exception each captain would have kept clear of the flagship and safe, and my good friend Admiral Tryon at the head would have shaved the flagship so near as to take a rise out of the chief. The following reminiscences add a personal touch of interest to the article:—

Knowing one another, and interested in one another, it is surprising how casualties are avoided in fleets, and it is more likely to prevent them, or minimise them, than anything else. I carry two such instances very pleasantly in the memory of my last commission in the Mediterranean. It was the custom there from time to time to order the lieutenants of ships to handle them during tactics, and signal was made desiring the captains "not to interfere except

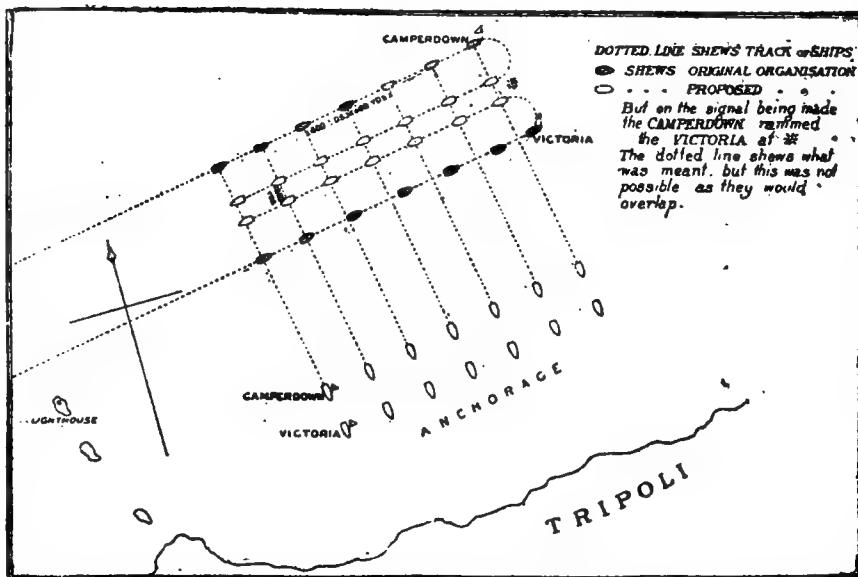

to avoid collisions." One day, when this had been done, a lieutenant of the *Achilles* misunderstood a signal, and placed his ship in such a position that a collision with the flagship was inevitable. Then the two captains resumed charge, and showed the whole squadron a little bit of sailing that must have delighted every seaman in it. Quietly and gently the two big ships were laid alongside one another, as if the most practised home port pilot had been laying each alongside a jetty. The damage done was trifling—a boat squeezed, the rail of a ladder broken, and a plate in the *Achilles'* side split by the blade of the flagship's screw. It showed how accurately the ships could work together. On another occasion the flag-ship got on a shoal in the Dardanelles in a snowstorm. Without delay her next astern, the *Sultan*, ranged up alongside, let go her anchor, and sent the cable to the stranded ship to heave off by. Such friendly competition and assistance gives that complete confidence in one another, that sense of solidarity, of being bound together, that adds so much to the moral strength of the whole and makes squadron life so pleasant. It is, in my opinion, in that direction that the efforts of every officer in the Mediterranean Fleet should be turned, to restore the mutual confidence that late events may have impaired. They have lost a chief who they know can never be surpassed, but he may be equalled. The Admiralty have taken the best means in their power to insure such a consummation.

Sir G. Phipps Hornby's conclusion is as follows:—

At present I submit that there is a blot to be wiped out. The disaster might have been avoided by more confidence and decision, as it was avoided in one of the cases I have mentioned. Officers are expected to have opinions of their own, and to act on them when emergencies may arise. The possibility of doing serious damage to a consort is a chief emergency, and any step promptly taken that averted the collision would have been in accord with the instructions of the Signal Book.

It looks to an old Mediterranean cruiser as if two things were wanting: first, the quick appreciation of facts that comes from continuous work in large squadrons; and secondly, the celerity of individual movement for which Sir George was striving.

The rest of the magazines do not publish any articles on the subject. They are probably waiting for the verdict of the court martial, which came too late for comment this month.

PLAN OF THE POSITION OF THE SQUADRON AND THE ATTEMPTED MANŒUVRE.

THE DUTY OF LOOKING NICE.

By THE AUTHOR OF "THE HEAVENLY TWINS."

THERE is a very charming article by Mrs. Grand, the author of "The Heavenly Twins," in the *Humanitarian*.

It is entitled "The Moral and Manners of Appearance," but the right title is "The Duty that is incumbent upon all advanced women of being as pretty as they know how."

I ventured to say something like this at a drawing-room-meeting in Edinburgh in spring, and was kindly taken to task by the prettiest lady present, who certainly could not have taken to herself any of my observations, for she was not only extremely good looking, but remarkably well dressed.

Mrs. Grand declares that advanced women do not pay enough attention to their appearance, and she even goes so far as to say that women might have had the suffrage a long time ago if some of the first fighters for it, some of the strong ones, had not been unprepossessing women. These two or three were held up everywhere as an awful warning of what the whole sex would become if they got the suffrage, and instead of argument, people used to say, "If you only saw the old harridans, their dress, and their manners, who are agitating for the suffrage, it would be enough. If women are to look like that when they get the suffrage, then defend me from it."

Of course, this is small-minded and absurd, but we have to take facts as they are, and Mrs. Grand does us

good service in insisting upon the duty of paying attention to outward appearances. But she bids the reformers go to school in this respect with the woman of the world, of whom she has a great deal to say that is unpleasant, but who has the saving gift of trying to make herself agreeable. Mrs. Grand says:—

What we want is the credit of having improved manners, not the odium of having corrupted them. We ourselves know, but the world does not recognise, and, therefore, must be taught, that it is not amongst us advanced women that the worst manners are to be found. For vulgarity, for boldness, for folly, ignorance, want of principle, petty weakness, intrigue, and positive vice, you must go to the average society woman. Her one motive is self-seeking. She is a bad wife, a bad mother, and a false friend. For intellect she has a fair supply of shrewdness and cunning; for religion, a rotten conglomerate of emotional superstitions that do not improve her conduct; for virtue, the hope of not being found out; while for charity, good feeling, modesty, and every womanly attribute, she substitutes tact—the tact to respond outwardly to what she sees is required of her by different people. The first accomplishment she acquires is the art of knowing what not to say. She is never aggressive, never opinionated; and, although she is quietly persistent, she never commits the mistake of being actively insistent. She listens and observes and bides her time—and she gets what she wants:

From a photograph]

MRS. GRAND.

[by H. S. Mendelssohn.

in which respect it is obvious that she is far superior to us whose motives and whose disinterestedness no one can honestly question. In a word the society woman has her good points. She cultivates what we too often scorn to consider, that is, charm of manner, that way of doing things

which does not ruffle anybody's temper or irritate them into opposition.

Mrs. Grand discusses the question as to how it is that advanced women should be careless about their appearance, and she lays the sin at the door of the old fathers at the church, who used to regard beauty and women as a dangerous addition to the resources of the Evil One. She says :—

We are so steeped in ecclesiasticism that those of us who desire to ennoble our lives and do some good in our time, generally begin, without asking why or wherefore, by despising our own personal appearance and neglecting to cultivate such attractions as we may have. This is such a matter of course, that when you describe a woman as earnest, ninety-nine people out of a hundred will immediately conclude that she is also a fright. And in this way earnestness is discredited, for there is a rooted objection in most minds to anything answering to that description, so that, by being inelegant, an earnest woman frustrates her own objects.

The following observations are very sound, and I heartily commend them to the attention of those who are doing their best to win every woman her rightful place in society and in the state :—

It has been said that principles rule the world, but at short distances the senses are despotic. When we speak, the range is a short distance, and it is then especially that fine feelings, rather than fine words, call forth the finer feelings of an audience. There are people who change the feeling of a room the moment they appear in it; it is as if they exhaled something magnetic that soothes the wearing passions.

We are sentient beings, and emotion is a factor to be reckoned with. It would seem, therefore, to be the bounden duty of every worker in a good cause to study the art of being prepossessing, and it is difficult to conceive anything more disastrously foolish than for women, at this critical period of their progress, to endanger their chances of success by being careless of the effect of their personal appearance, or by neglecting the cultivation of charms of manner, when the use of these two powerful auxiliaries is beyond question a good use.

On no account leave the heart out of your calculations. There are people who endeavour to travel on their heads (as the Americans phrase it), while their hearts contract, and the consequence is that their harshness repels much oftener than their cleverness convinces. To succeed all round, you must invite the eye, you must charm the ear, you must excite an appetite for the pleasure of knowing you and hearing you by acquiring that delicate aroma, the reputation of being a pleasing person, and then you will be well on the way to satisfy the palates of those who test the quality of your opinions. We may be sure that, if manners make the man, they will make the woman too.

The Ordination of the Elders.

Our numerous Scottish readers who love the Kirk of their ain country will be glad to hear that a very faithful reproduction of the painting by Mr. J. H. Lorimer, A.R.S.A., entitled "The Ordination of the Elders in a Scottish Kirk," has been published by Aitken Dott and Co., of Edinburgh. It is a large plate, suitable for framing, and the reproduction has been made by the Swan Electric Engraving Company. The picture itself is full of human interest. The venerable, grey-haired pastor, standing with uplifted hands beneath the kirk pulpit, and the six grave and reverent elders at the table who, with bowed heads and closed eyes, are being ordained to the service of the kirk, form a most striking and impressive group. The London agents of the publishers are Obach and Co., in Cockspur Street, S.W.

HOW TO CELEBRATE A NATIONAL HOLIDAY.

Mrs. JULIA WARD HOWE, in the *Forum* for July, suggests the following improved method of celebrating the American National Fête. As many of her suggestions are equally applicable to many countries where National Fêtes are celebrated, I quote the following :—

On the evening of July 3rd, quiet gatherings in halls or churches, in which the true love of country should be explained and illustrated. How many a name, half or wholly forgotten, would then be recalled from oblivion, and with it the labour and sacrifice of some noble life, some example precious for the community!

The morning of the fourth to be ushered in by martial music, and a military display sufficient to recall the services of the brave men who gave our fathers liberty. At ten o'clock orations in various public buildings, the ablest speakers of the Commonwealth doing their best to impart the lesson of the day. At one a Spartan feast, wholesome and simple. No liquor to be served thereat, and none to be sold during the day. From twelve to half-past four in the afternoon, I would have exercises for the children of the public schools, examination of classes in American history, prizes given for essays on historical and patriotic subjects. Later, a gathering in public gardens, and a tea, with fruit and flowers, served for the children of the city. In the evening, the singing of national anthems, *tableaux vivants* and fireworks, and in some form, a pastoral benediction.

To these exercises I would add the signing of a pledge of good citizenship. We take much pains, and not unwisely, to persuade men and women to sign a pledge of total abstinence from alcoholic liquors. But why should we not go further than this, and lead them to pledge themselves to some useful service in the community? I would have the history of other Republics brought forward on this day, and especially, the heroic struggles of our own time. Among these, I would certainly accord a place to the story of the great-hearted men to whom Italy owes her freedom. And I would if I could compel the attendance of our men and women of fashion upon lectures in which the true inwardness of European society should be exposed, and the danger shown of the follies and luxurious pomp which they delight in imitating, and which, however aesthetically adorned and disguised, are for us a lead in the pathway of moral and intellectual deterioration.

I would have the great political offences of the century fitly shown, the crimes of Louis Napoleon, the rapacious wars of Germany, France, and England, the wicked persecution of the Jews. Now that we are nearing the close of our nineteenth century, it becomes most important for us that its historic record should be truly rehearsed, its great saints and sinners characterised, its wonderful discoveries and inventions explained.

I had at one time a plan of my own, of setting apart one day in the year as a Mother's Day. This festival was to be held in the interest of a world's peace, and for quite a number of years it was so observed by groups of women in various parts of the country. It now occurs to me that we should make our Fourth of July a Mother's as well as a Father's day. In the public programme of every town throughout our vast Commonwealth, women should have some word to say and some part to play. And as in the forms of oratory with which we are familiar, much is made of what the world owes to America, we might suggest that our women speakers might especially bring forward the antithesis of this question, in another, *viz.*, What America owes to the world.

The suggestion as to signing pledges of good citizenship is one which might be taken up with advantage elsewhere than in America.

NATIONAL LIFE AND CHARACTER.

MR. PEARSON REPLIES TO HIS CRITIC.

MR. PEARSON'S book on "National Life and Character" has attracted such widespread attention, and has been so favourably reviewed everywhere, that most readers will turn to his answer to some critics with which Mr. Pearson begins the new number of the *Fortnightly*. Mr. Pearson retorts to the *Spectator*, which has accused him of despairing of God's Providence, by reminding his critic that such a thing is different from a belief in national or personal prosperity. He then elaborates once more the reasons which he has for believing that the armaments and commerce and forces of China and India may yet dominate the world. He repudiates the accusation that he has failed to recognise the possibilities of North America and of Australia, but the chief part of his article is devoted to a vindication of his contention

that a Church recognising the existence of believers only and working for a life beyond the grave, is bound to be inexorable in its ideal, and to admit of no compromises with human frailty, and that precisely on this account it is unfitted for the task of governing fallible men and women.

THE CHURCH IN POLITICS.

Replying to the objections of some of his clerical critics, he asks:—

What has the great political influence which the Church wielded been employed to effect during the present century? Did the bishops or the Church support the removal of religious disabilities from Protestant Nonconformists or from Roman Catholics, or from Hebrews? did they help to carry negro emancipation? did they lend their aid to the cause of national education? were they on the side of liberty in the one critical struggle of our own times, the war of North against South in America? is it in them the Temperance party finds its chief allies? or to them that the Labour party looks for advocacy? Scores of admirable clergymen have helped in every one of these great battles for right, but the mass of their clerical brethren have been steadily on the side of vested interests, and half unconsciously no doubt, for whatever commended their organisation to favour with the classes. Therefore, if it is a question whether the State may not advantageously supersede the Churches in some matters that seem to be rather moral than political, it is surely a possible conclusion from past history that the Churches have not deserved so well of society that they should divide the ordering of life with the civil power.

HOW THE STATE IS SUPERSEDING THE CHURCH.

He is careful to point out, however, that while deprecating the substitution of the Church for the State as the governing authority, his objection is purely political. He says:—

I believe the Church, in its true sense—that is, the great body of Christians bound together by a living faith—can never be superseded by the civil order for the discharge of peculiar work. Where I hesitate is from a purely political point of view. I have seen a system of primary education made so perfect as very much to destroy even the desire for the higher culture; and it is a commonplace of criticism that work which has every distinction but that of genius may be so excellent that the world acquiesces in it as sufficient. Would it be so very unnatural if the State that has gradually assimilated much of Christianity into its own system should end by appearing to the mass of men to give them all that they need? All those functions which civil society has gradually, and often reluctantly, taken into its own hands—education, the relief of poverty, the ordering of the marriage laws, the protection of women and children, the opening up of careers to honourable ambition—are a large part of what constituted the strength of the Church in old times.

THE APOLOGIST PLEA OF THE PESSIMIST.

Mr. Pearson concludes his article as follows:—

Let us bear in mind that changes for good may sometimes assist in producing results which it is usual to ascribe to a laxer morality. The cry for divorce in our own times has been raised partly because the higher ideal of marriage which public morality enforces does not allow it to be relieved even in the man by occasional libertinage; and partly because the modern wife is very properly not as tolerant of rivals as the ladies of only a century ago were. It is impossible to regret the higher tone of public opinion among ourselves; but surely it is allowable to point out that society is losing something which, on the whole, worked well in past times, as it gradually parts with the old conception of the family. Neither here nor in the very similar case of the decreasing influence of religion can I suggest a remedy. The State, though it seems to me to deserve all reverence and love when it lives up to its magnificent possibilities, cannot even hold the highest ideal, much less attempt to force it upon men and women. They must be left to order household life very much as they will, to think fearlessly, to believe, to doubt, or to deny, as their reasoning powers and their conscience demand of them. May not a man, who does not presume to say how society should be reconstructed or faith purified, do a little good work if he shows that we are not destined to stumble upon a millennium by mere effluxion of time, or by some blind force which we call "progress" impelling us?

Mr. Pearson as a Prophet.

MR. PEARSON'S famous book is the text of an essay upon "National Life and Character" in the *Quarterly*. The reviewer cannot accept Mr. Pearson's forecast as a true prophecy. Speaking of his book, he says:—

Instructive and suggestive as it is, in many ways, it seems to us chiefly notable as a sign of the times. That so candid, considerate, and comprehensive an intellect should take it for granted that Christianity is behind the age, that it has done its work, and can no longer be reckoned a great power in the world's order, surely may make us pause. We want a deeper, a broader, a more vital, a more ideal apprehension of Christianity than is common among us. We want an exposition of it which will harmonise and consecrate all that is new and undeniable in the current knowledge. Thus, and thus only, can its teachers satisfy that craving after law which has driven so many into Atheism, and that longing for a personal union with the Infinite and Eternal which is the root of Pantheism.

A Church View of Mr. Pearson.

THE writer of the article in the *Church Quarterly Review*, on "The Hope of Humanity," says that Mr. Pearson's forecast of national life and character is one of the most pessimistic volumes that has appeared of late years, although at the same time one of the most interesting. The reviewer says:—

His "open eyes," like those of Freedom, "desire the truth," and nothing but the truth. We may, however, be permitted to doubt whether some regenerating influences, and some factors moral and physical, too complex, perhaps, to be visible until a few more pages in the book of destiny have been turned, have not eluded his scrutiny. However, our thanks are due to Mr. Pearson for having produced a most suggestive and valuable work. It is a book every page of which teems with thought, and raises many more questions of vital interest than could be dealt with adequately within these limits. It is a serious attempt to foreshadow some of the next scenes in the world's drama, and to weigh exactly the probable losses of modern life and character against their gains.

In the *Atlantic Monthly* Eugenia Skelding writes an appreciative paper upon Miss Clough, the first Principal of Newnham College.

HOW THE SLAVE TRADE BEGAN.

THE STORY TOLD BY MR. FROUDE.

IN *Longman's Magazine* for August Mr. Froude publishes the second part of his paper on "English Seamen in the Sixteenth Century." The most interesting part is devoted to his account of how the slave trade began. The founder of the slave trade was Sir John Hawkins, the representative of a solid, middle-class Devonshire family. He stuck to business, traded with Spanish ports without offending the Spaniards, and while trading with the Canaries heard a great deal about the West Indies and the profits that might be made from supplying negroes to the Spanish settlers. He was intimately acquainted with the Guinea coast, and knew well how easily a human cargo could be obtained.

ITS PHILANTHROPIC ORIGIN.

Mr. Froude points out that the original suggestion of introducing negroes into the West Indian Islands emanated from the philanthropic Bishop Casas, who suggested it as a means of saving the remnant of the Indian tribes. The prisoners taken in negro war with Africa were usually massacred; if they could be enslaved their lives would be saved, and there was a chance that they might all become Christianised and civilised:—

The experiment was tried and seemed to succeed. The negroes who were rescued from the Customs and were carried to the Spanish islands proved docile and useful. Portuguese and Spanish factories were established on the coast of Guinea. The black chiefs were glad to make money out of their wretched victims, and readily sold them. The transport over the Atlantic became a regular branch of business. Strict laws were made for the good treatment of the slaves on the plantations. The trade was carried on under license from the government, and an import duty of thirty ducats per head was charged on every negro that was landed. I call it an experiment. The full consequences could not be foreseen, and I cannot see that as an experiment it merits the censures which in its later developments it eventually came to deserve. Las Casas, who approved of it, was one of the most excellent of men. Our own Bishop Butler could give no decided opinion against negro slavery as it existed in his time. It is absurd to say that ordinary merchants and ship captains ought to have seen the infamy of a practice which Las Casas advised and Butler could not condemn.

A SPANISH MONOPOLY.

The Home Government of Spain and Portugal claimed a right of monopoly in the trade. The Spaniards in the Canaries suggested to Hawkins that he would be very heartily welcomed if he would undertake to smuggle negroes into the West Indies. Mr. Froude points out that Mr. Hawkins could not be blamed for cutting into a traffic already established, which was sanctified by the Church, and to which no objection had been raised anywhere on the score of morality. Hawkins formed an African Company of the leading citizens of London, and fitted out three small ships, which sailed in 1562. These vessels picked up three hundred negroes at Sierra Leone, and sold them to a great profit in San Domingo. The Spanish Government, terrified at his intrusion into the West Indies, confiscated the cargo of hides in which he had invested the profits of his slave trading; and thus began the quarrel, which Hawkins improved and developed, until the English had established a regular slave trade with the Spanish Indies.

QUEEN ELIZABETH AS SLAVE-TRADER.

Elizabeth lent Hawkins the *Jesus*, a large ship of her own of 700 tons, and took shares in the second African Company. She not only equipped the ship, but put 100

soldiers on board to provide for contingencies. On the second voyage Hawkins bought 400 negroes, and had a narrow escape of losing them owing to lack of water when he was near the equator; but as he piously recorded in his log, "The Almighty God would not suffer his elect to perish," and sent a breeze which carried them safe to Dominica. This was the beginning of the slave trade, which lasted for more than two centuries before it was finally suppressed.

The Programme of a Christian Economist.

THE *Review of the Churches* noticing Dr. Washington Gladden's recent work, "Tools and the Man," thus summarises Dr. Gladden's programme:—

Beyond the limits of *laissez faire* he advocates the following extensions of the sphere of government:—

1. Free education in State schools.
 2. Sanitary supervision, securing pure air and water for all the people.
 3. Discouragement, if not extirpation, of parasites on industry, viz., criminals, paupers, gamblers, and gambling speculators.
 4. Suppression of the saloon and of the liquor interest generally.
 5. Prohibition of Sunday labour: "the liberty of rest for each requires the law of rest for all."
 6. Limitation of hours of labour in some callings if not in all; protection of the liberty of most against the tyranny of a few.
 7. Efficient sanitary inspection of factories, workshops, and mines.
 8. Peace-making—(1) in all industrial disputes, by models and suggestions, permissive legislation, appointment of district tribunals; by compelling all quasi-public corporations to submit their disputes to such tribunals; and (2) arbitration treaties with every other nation.
 9. State control, as of the Post-office, of telegraphs, railroads, street railways, gas, electric light, and all virtual monopolies; for their exactions come properly under the head, not of trade, but of taxation, and there should be "no taxation without representation."
 10. Control of the economic monster known as "trust," "syndicate," etc.
- Sharp limitation of the amount of land which any individual is allowed to control.
- Heavy taxation upon all legacies exceeding a certain sum.
- Parting counsel is given to the reader to remember that Christianity is more than a law; it is a spirit and a life. "We need better methods; still more do we need better men. Bad philosophy has slain its thousands, but bad temper its tens of thousands."

Some Grievances of Working Women.

MISS HELEN CAMPBELL, in the *Arena*, refers thus to two great grievances of women workers, which grievances, alas! are by no means confined to the United States:—

The question of seats for saleswomen comes up periodically, has been at some points legislated upon, and is, in most stores, ignored or evaded. "The girls look better—more as if they were ready for work," is the word of one employer, who frankly admitted that he did not mean they should sit; and this is the opinion acted upon by most. Insufficient time for meals is a universal complaint, and nine times out of ten the conveniences provided are insufficient for the numbers who must use them, and thus throw off offensive and dangerous effluvia. It is one of the worst evils in shop life, not only for Massachusetts but for the entire United States, that in all large stores, where fixed rules must necessarily be adopted, girls are forced to ask men for permission to go to closets, and often must run the gauntlet of men and boys. All physicians who treat this class testify to the fact that many become seriously diseased as the result of unwillingness to subject themselves to this ordeal.

WHAT WE HAVE TO COME TO.

THE DAY DREAM OF AN ASTRONOMER.

M. CAMILLE FLAMMARION, in the *Cosmopolitan* for July, carries his narrative of the last days of the world beyond the time when the collision with the comet so nearly destroyed our planet. His speculations as to the future of humanity are interesting. He calculates that in the year 3000 the population of the world had doubled, the population of the planet consisting of two thousand and ten millions of persons, all of whom spoke English, although there were many new words generally of Greek derivation. Long before the twenty-fifth century war had disappeared, and the first interesting part of his paper describes how this was brought about.

and the war budget was voted from year to year. It was then that the young girls resolved never to marry a man who had borne arms; and they kept their vow.

THE MARRY-NO-SOLDIER LEAGUE.

The early years of this league were trying ones, even for the young girls; for the choice of more than one fell upon some fine-looking officer, and, but for the universal reprobation, her heart might have yielded. There were, it is true, some desertions; but, as those who formed these marriages were from the outset despised and ostracised by society, they were not numerous. Public opinion was formed, and it was impossible to stem the tide.

For about five years there was scarcely a single marriage or union. Every citizen was a soldier, in France, in Germany, in Italy, in Spain, in every nation of Europe—all ready for a

M. AND MME. FLAMMARION.

HOW WOMEN ENDED WAR.

This good work was not brought about until the progress of destruction had made such strides that statisticians were able to prove that war regularly claimed forty million victims per century, or eleven hundred per day without truce or intermission. This blessed result was not attained until the middle of the twenty-fourth century.

Under the inspiration of a woman of spirit, a league was formed of the mothers of Europe, for the purpose of educating their children, especially their daughters, to a horror of the barbarities of war.

In a single generation this rational education had freed the young from this remnant of animalism, and inculcated a sentiment of profound horror for all which recalled the barbarism of other days. Still, governments refused to disarm,

confederation of states, but ever recoiling before questions represented by the national flag. The women held their ground; they felt that truth was on their side, that their firmness would deliver humanity from the slavery which oppressed it, and that they could not fail of victory. To the passionate oburgations of certain men they replied: "No! we will have nothing more to do with fools"; and, if this state of affairs continued, they had decided to keep their vow, or to emigrate to America, where, centuries before, the military system had disappeared.

The most eloquent appeals for disarmament were made at every session to the committee of administrators of the state, formerly called deputies or senators.

VICTORY IN FIVE YEARS.

Finally, after a lapse of five years, face to face with this wall of feminine opposition, which, day by day, grew stronger and more impregnable, the deputies of every country, as if animated by a common motive, eloquently advocated the

cause of women, and that very week disarmament was voted in Germany, France, Italy, Austria and Spain.

It was spring-time. There was no disorder. Innumerable marriages followed. Russia and England had held aloof from the movement, the suffrage of women in these countries not having been unanimous. But as all the states of Europe were formed into a republic the ensuing year, uniting in a single confederated state, on the invitation of the government of the United States of Europe, these two great nations also decreed a gradual disarmament.

As a result, taxation went down by nine-tenths, everyone breathed freely; bureaucracy was practically dispensed with, and civilisation may be said to have had, for the first time, a fair chance.

SOME SCIENTIFIC SPECULATIONS.

The following are some of the changes which M. Flammarion thinks may be brought about. The metric system of weights and measures was universal; there was only one kind of money in circulation; one meridian, and that was of Greenwich. France had disappeared in the twenty-eighth century, Italy in the twenty-ninth, Germany in the thirty-second, while England had spread over the surface of the ocean. All forests had been destroyed. Meteorology enabled the weather to be predicted with absolute accuracy. Aerial navigation was universal, custom-houses disappeared, electricity had taken the place of steam, and all generally was founded upon the progress of astronomy—an observation which comes naturally from an astronomer. The legal rate of interest had fallen to one-half per cent. Animals were no longer slaughtered for food; chemists manufactured all that was required from the air, water, and vegetables. Nourishment was absorbed by the mouth in exquisite drinks, fruits, cakes and pills.

Agricultural products were manufactured by electricity; hydrogen was extracted from sea-water; the energy of waterfalls and tides was utilised for lighting purposes at a distance; the solar rays, stored in summer, were distributed in winter, and the seasons had almost disappeared, especially since the introduction of heat wells, which brought to the surface of the soil the seemingly inexhaustible warmth of the earth's interior.

THE NEW HUMANS.

Many changes had been brought about in the human body. Women's heads had grown bigger and their bodies smaller, and the same change was also observable in men. There was only one race throughout the whole world; there was only one religion—the voice of an enlightened conscience—and the whole world was under one general government. All the wild animals had disappeared from the earth, and whales and seals had vanished from the sea. Mankind had acquired a seventh sense—the electric sense—and the eighth or psychic sense, by which communication at a distance became possible. By the aid of an instrument called the telephonoscope everything that happened anywhere in the world could be seen and heard simultaneously all over the planet. By the cultivation of psychic science latent faculties of the soul had been discovered, mind acted rapidly upon mind at a distance; communication was opened up, first with Mars, second with Venus, and thirdly with Jupiter. Medicine had been transformed by hypnotism, magnetism, and psychic observation, and telepathy had become a great science.

A NEW WORLD.

The capital of the world was a new Athens which had been on the shores of Lake Michigan; Lisbon had been destroyed by the sea; Madrid, Rome, Naples and Florence were in ruins; Paris shared the same fate. Chinese to

the number of a thousand millions spread over Western Europe; their principal capital stretched like an endless street from Bordeaux to Toulouse. Amsterdam, Rotterdam, Versailles and Rouen had sunk below the sea level, and were covered with water. In the eighty-fifth century Paris was covered with water to the height of the towers of Notre Dame. China was submerged, the bottom of the Atlantic had risen to the surface, a portion of the United States had disappeared, and a continent rose in the place of Oceanica. The duration of human life was prolonged to one hundred and fifty years; youth lasted nearly a hundred years. The human race reached its apogee, and for a hundred thousand years remained at its zenith; then a gradual decline began.

HOW THE WORLD WILL END.

The quantity of water in the world began to decrease, the great ocean disappeared, the only remaining seas were confined to the tropics, there were no more mountains, no more condensers of snow, all vegetation changed, and the earth's rotation became slower, the day lasting one hundred and ten hours. As this is not going to happen for ten million years we do not need to be very much alarmed. What is going to happen after that M. Flammarion will tell us in the August number of the *Cosmopolitan*.

Mail Steamers.

MR. W. J. GORDON continues his most instructive and fact-crammed series of papers on "The Way of the World at Sea" in the *Leisure Hour* by an article devoted to the mails. He began by telling the story of how the *Campania*, with 30,000 horse-power, beating the *Paris*, with 18,500, by nearly six hours. She passed the Fastnet in 5 days 17 hours and 27 minutes from Sandy Hook, which was 24 hours better than the previous best. He then goes on to gossip about the mail carriers of the world. The P. and O., out of a series of 500 deliveries, had only seven cases of trifling unpunctuality. The Australian mail steamers pay £100 a day fine for every day beyond the contract limit. The Indian and Chinese mails are fined £100 for every twelve hours' delay. The Queensland mail is fined £5 an hour for delay, and is allowed fifty-six days for the journey. The Holyhead and Kingstown boats are fined 34s. for every minute that they are late, their time allowed being four hours and seven minutes to Kingstown, and four hours and two minutes back to Holyhead. The Irish mail boats receive £95,000 a year subsidy—only £4,000 less than is paid for all the North American mails from Queenstown to New York. France pays two of her steamship lines a million a year. The largest sum paid on English lines is the £265,000 given to the P. and O. The bridge on the Atlantic liner is sixty-five feet above the water-line, and the crow's nest is thirty-five feet above that again; so that the look-out is fifteen miles in front, which is only twenty minutes ahead, if another ship is approaching at the same rate.

In the *Palestine Exploration Fund* there is an announcement of a new discovery of tablets of burnt clay at Tell el Hesi, which have brought to light correspondence from Consuls and Governors of Syrian towns with the Kings of Egypt as far back as 1400 B.C. The most interesting paper in the number is Mr. Baldensperger's "Answers to Questions" about the "Peasant Folk-lore of Palestine."

AN EVENING WITH PAUL VERLAINE.

BY A SCANDINAVIAN ADMIRER.

Tilskueren has a bright article from the pen of Sophus Claussen entitled "A Night with Paul Verlaine." From beginning to end it is so full of lively enthusiasm, and so vivid in its descriptiveness, that one walks along, step by step, with the light-hearted Sophus and his friend, through the mild damp January eve, to the crowded café, *Soleil d'Or*, in the Quartier Latin, and takes one's place with them at one of the little tables under the dim gas-jets to sing and drink ale with the gifted Bohemian-hearted writers of *La Plume*—the very air pregnant with mirth and geniality, though it is one cloud of tobacco smoke and everyone's clothes are wet or damp. It is the kingdom of Paul Verlaine, this "Golden Sun" café in the heart of the Latin Quarter. He is known and loved by all—the penniless writer-hero who sleeps among vagabonds "too rich in soul to keep earthly goods above an hour—too great and good for the Academy!"

Paul Verlaine does not present himself this evening before his disciples and worshippers until late. But while we wait, we get steeped to the fingertips in the liveliness about us. Over there in the distance we see Mons. Deschamps, the editor of *La Plume*, with a genial and a happy smile about his lips; and a sprinkling there is of the fair sex, too. All feet are lovingly beating time to the song that rolls boisterously up around us:—

"Chantons, chantons comme Verlaine!
En avant!
Nous avons du talent!"

By-and-by Paul Verlaine himself arrives. A wonderful head! In his face an expression of anxiety "older than the flood," but for the rest, a bearing and a personality so instinct with ease and glorification, that one thinks at once of some old Greek philosopher—Socrates, whom, indeed, he resembles in the massive brow and the little turned-up nose. White linen and dainty clothes he knows not of. His dress is all awry, with torn button-holes minus the buttons, and from beneath the grey beard peeps a grey wool shirt by no means clean. He is at once the centre of an adoring crowd. A sixty-two-year-old red-beard, with a disciple-mien such as may have belonged to Simon of the Scriptures, bends down and rubs the Master's back with his own coat-tails, for the great philosophical cloak—the only decent garment Père Verlaine carries—is soiled with two great patches of street dirt.

Père Verlaine takes no heed of him, save to shrug his shoulders between whiles when the cleansing operation becomes too violent: "That's enough, Bibi! that's enough!"

In a moment Sophus Claussen and his friend are brought forth by Mons. Deschamps to be introduced to this lion of lyrics as a couple of Danish admirers—Sophus Claussen being presented with a grave, earnest respect that makes him quite ashamed of himself, as "the Danish translator of Baudelaire." But alas! Père Verlaine knows even less of Denmark than he knows of clean linen.

"I too," he observes politely, "have been in Holland. I lectured in Amsterdam—most lovable people!"

In vain do the two Danes seek to put him right and pilot his thoughts a little further north. If they are not Hollanders, "they are still Swedes all the same."

A long enthusiastic talk of Baudelaire, and then it is time to quit *Le Soleil d'Or*.

From café to café then they drive, through the Students' Quarter, and from each are turned out at closing-time.

Later on, leaning over a table in a little café, he tells his "Holland" friends some amusing anecdotes.

"There's one good girl—an old friend," he says, gesticulating with his arms, "who takes care of me at times, gives me clean linen, and defends me when folks speak ill of me. 'Oh, now, really he is not so bad,' she says, 'he wears a high hat.' One day this girl says to me, 'How like François you are!' 'Do you mean Frans the First?' I asked. No, she meant François Coppée, my colleague, member of the Academy, and she knew him well, too. 'He has spoken of you,' she says. 'Of me?' said I. 'Yes, of you,' answers this girl-child, 'for he's not a bit proud, you know.'"

THE VARIETY ARTISTS OF THE MIDDLE AGES.

In the *Nouvelle Revue* of July 15th, M. de la Marche describes the male and female variety artists (*Joculateurs*) of the Middle Ages. As early as 1321 the French strolling players could boast of their own Corporation or Guild. They had their special charities, system of mutual insurance, and even burial fund. As they were not allowed to practise their art during Lent, they devoted those five weeks in the year to practising and learning new songs; but this in all seriousness, for they were noted for their piety. We only learn of three kings who were hostile to them, and who persisted in treating them as though they had been comedians; these were, in France, St. Louis and Philippe Auguste, and in England, Henry the Third. But even St. Louis did not disdain to look on their tricks from time to time. The singing of ballads entered largely into the artists' programme. They seem to have composed the verses as they sang, bringing in all sorts of topical allusions, such, for instance, as the death of Simon de Montfort, the murder of St. Thomas à Becket, or a royal marriage. As for the female artistes, there was nothing they could not do: some danced, some sang, some walked on the tight rope, and they seem to have been the first circus riders the world has known; and from time to time the clergy found themselves compelled to warn their congregations against the too charming artiste. It was not uncommon that the artist became a monk and repented of his ways; it was rare indeed that an artiste abandoned her wild life. Among the most famous conversions of the Middle Ages that of a certain variety artist named "Le Tombeur de Notre Dame" has remained to us, together with the following curious legend. This man, who seems to have been the father of all modern acrobats, became touched with grace and made up his mind to enter the Monastery of Clairvaux, but once there he found himself sadly out of place, for all were busy serving God and the Blessed Virgin; he knew how to do nothing but turn somersaults and perform such like tricks, which were, of their kind, extraordinarily clever, but of little good in a monastery. At last he said to himself that doubtless the Mother of God would take the wish for the deed; so one day he began a series of his formerly most celebrated performances before a certain stone Virgin placed at the bottom of a crypt. He went through these pious exercises each day, finding therein infinite consolation and satisfaction. But on one occasion a monk surprised him, and hurried to the superior with the news; the latter, highly scandalised, was just about to enter the crypt when he suddenly saw the Mother of God herself, descended from her pedestal, wiping the poor acrobat's brow with a celestial handkerchief. Marvelling at the sight he quietly withdrew, and the *tombeur* has descended to this day as one of the holiest monks the world has ever known.

THE TAXATION OF LARGE ESTATES.

AN AMERICAN PROPOSAL.

In the *Annals of the American Academy* for July, Mr. R. T. Colburn prints a proposed bill, in which he sketches out a law for carrying into effect the proposals he made in 1891:—

SUGGESTED REFORMS.

(1) Making a legal distinction between a property competence, to be freely heritable, and a surplus which should be subject to State participation; (2) the creation of a public legate for the purpose of accepting gifts, legacies, and the proceeds of taxes on inheritances, and devoting them to works of philanthropy, charity, instruction, amelioration, and compassion, on plans comprehensive and systematic, much more effectual than the donor could himself devise or organise, even if his will were to be respected.

A COUNCIL OF BETTERMENTS.

By his bill he proposes to establish a Council of Betterments which would dispose of the succession duty he proposes to levy upon all large incomes upon the decease of their owners. This Council of Betterments would also succeed to all estates of persons dying without heirs. The succession tax of the bill varies from a minimum of five per cent. to a maximum of fifty per cent., according to the relationship of the person to whom the money was left.

LIMITATIONS AND EXEMPTION.

He makes, however, this important limitation:—

Provided, always, that no such tax shall be levied or collected on the shares of minors or dependents of the first class, except on the amount in excess of ten thousand dollars (\$10,000); nor on the shares of minors or dependents of the third class in excess of five thousand dollars (\$5,000); nor shall the homestead, its furniture, fittings, ornaments, implements, or customary belongings, be accounted in the appraised value of any share, nor be subject to any deduction, to the end that comfortable and beautiful houses may be encouraged and not discouraged; but money, bullion, precious stones, gold or silver plate, jewelry, pictures, carriages, merchandise, artistic or curious collections, beyond the ordinary and suitable requirements of the successor, shall be so subject to appraisal and deduction. Gifts or legacies to the said Council of Betterments, or to such eleemosynary, charitable, religious, or educational agency, corporation or association as shall be co-operating therewith and subordinate thereto as provided in Section 7 hereof shall be specially exempt from all appraisal or deduction therefrom.

THE FUNCTIONS OF THE COUNCIL.

The Council having got its money would be empowered to spend it as follows:—

It shall be the duty of said Council to apply the revenues accruing to works of amelioration, alleviation, embellishment, to the acquisition and diffusion of useful knowledge, and for wholesome relaxation from toil and care, for the benefit of the whole people such as shall be by the Council found worthy of initiation, support or assistance, and such as they may from time to time adopt, select or encourage. For this purpose the public parks, pleasure grounds, drive-ways thereof, the places of sepulture, memorial structures, collections of prehistoric or historic relics, zoological, botanical, archæologic curiosities; also the prisons, poor-houses, reformatories, asylums, or other retreats for the care of defective or criminal classes, sustained in whole or in part out of the public taxes, or by contributions from the said Council of Betterments, be and they are hereby placed under the control and charge of said Council for the purposes of supervision and regulation, in accordance with the intent of this Act.

There is hereby conferred on said Council power and authority to visit, inspect, and report upon the organisation, the inmates, officers, management, revenues and property of

any charitable reformatory, religious or educational corporation or association within the State, which shall receive any assistance, compensation or revenue from the public taxes, or from any municipality therein; and the receipt of any thing of value therefrom shall, *ipso facto*, subject such person, corporation or association to the authority herein conferred.

It shall be the duty, in like manner, and as resources and occasion may justify, to invent, supply and maintain means and measures for the training, reformation and rational enjoyment of the neglected youth of the Commonwealth; also to promote in a systematic, economical way the care and welfare of foundlings, orphans, decrepit, incurable or senile population. To that end it may found schools of applied science, arts, music, domestic cookery or handicraft in such manner as will in its judgment, without pauperising or degrading the recipients, promote the welfare of society.

POLITICAL ECONOMY AND THE GOSPEL.

THE *Nouvelle Revue* contains an article by M. Funck Brentano on "The Connection between Political Economy and the Gospel," which is worth noting though almost too subtle. He opens fire upon the two English Economists, Jeremy Bentham and Adam Smith, oddly enough putting Bentham first in order of time. His comprehension of their theories, however, is clear, and so is his exposition of the works of Karl Marx, which he takes as the inevitable result of the intolerable burden imposed by the older school. He puts very clearly Marx's division of the product of labour: the small part paid to the labourer, the large part paid to the man with the capital; and he shows further that even on the ultimate distribution of the wages fund, the capitalist who provides food and clothes for the labourer lays a heavy hand. The workman pays extra to the landlord, to the butcher, to the man who makes his boots; he pays for the use of their money as well as for their actual work.

M. Funck Brentano also puts very clearly the indubitable truth that if somebody buys in the cheapest market and sells in the dearest (which is the way in which modern fortunes are made), another somebody sells in the cheapest and buys in the dearest market. In the markets of the world people do not do what they would wish to be done unto them.

Now, our author appears to think that in any given circle or neighbourhood a system of mutual help and forbearance should obtain. Some of his remarks point to protection. Very striking are his remarks on the economics of the Crusades:—

Our ancestors flung themselves, without any centralised administration, without military organisation, without suitable means of transport, into a colossal and chimerical enterprise which nevertheless succeeded. All reasons which have been alleged for the success of the First Crusade are insufficient. Faith, devotion, account for the way in which the men of the twelfth century left their homes for this wandering expedition, tramping the roads like the Athenians of old, braving the deserts like the children of Israel. We understand their patience, their sufferings, their cruel privations. But also day by day this multitude had to be fed; all these feudal lords and their vassals from the old home farms; all those merchants and purveyors who followed the men at arms. Had they not been sustained by a common hope and a common principle, the Crusaders would never have crossed the frontier of France. If any lord concerned had bought in the cheapest and sold in the dearest market the Crusades would have degenerated into a civil war.

And the great cathedrals—the great public buildings of the Middle Ages; had the materials and the labour been bought in the cheapest and sold in the dearest market, where would they be after six hundred years?

The thought is suggestive; the article no less so.

WANTED, A POPULAR POLITICAL ECONOMY.**THE NEED FOR SOUND EDUCATION.**

MR. CHARLES W. SHIELDS, in the *Quarterly Journal of Economics*, of Boston, publishes an article on the problem of economic education, in which he sets forth what he considers to be the fallacies which vitiate the popular political economy of the American voter:—

The popular political economy, not being based upon wide study of any sort, but upon a few simple principles, can best be met on its own ground by showing the fallacies on which those principles are based. In the very fact that education and intelligence do not seem to have weakened the hold of the popular political economy on the public mind we have good evidence that mere increase of intelligence will not suffice to eradicate it. What we want is better training in the art of right thinking.

The direction which the present writer believes that elementary economic teaching should take may be made more evident by some examples of the propositions which he holds should be taught to or discussed by students. Such propositions are:—

That the exports of a country will, in the long run, approximately balance the imports, no matter what restrictions may be placed upon the latter.

That the ultimate effect of such restrictions is to make exports less profitable: hence that the so-called balance of trade needs no regulation, and that there is no danger of our interests suffering from an excess of imports.

That no raising of wages is of permanent benefit to the masses unless accompanied by an increase in the production of things for the masses to eat, drink, and wear.

That every increase in the production of those necessities of life which the masses find it hard to obtain makes their command easier to some, and places them within the reach of others; while every cause which has the effect of diminishing such production will compel some class to go with less of them than they would otherwise enjoy.

That the value of every industry is to be measured, not by the employment it gives to labour, but by the usefulness of its product; in fact, that the employment shows the cost of the industry, not its utility.

That the employment of the unemployed at the public expense would be of no permanent benefit, unless the result of their labour could be sold for at least its cost.

That there is plenty of employment for everybody, if men only had the wages to pay them, so that what is called want of work really means want of money to pay for the work.

That the lower the wages demanded in any employment, the greater the number of people who can find employment at those wages; and the higher the wages demanded, the less the number.

That the supposed beneficial effects of an increase of currency upon business would only prove temporary, and would be followed by a depression corresponding to the stimulus which business had received.

That prices are determined, in the general average and the long run, by the quantity of any article produced and the demand of the public for it; that any attempt to artificially raise the price of any service whatever above the limit thus fixed will result in a diminished consumption, and hence in a diminished production,—in other words, that you cannot get the public to accept more than a certain quantity of service or goods at any definite price, which quantity diminishes with the price.

That there is no possibility of a general increase in the demand for labour except by measures which would speedily neutralise their own effects, and that attempts to promote or encourage one branch of industry by making it more necessary only result in an equal discouragement to other branches.

That a commercial marine is of no benefit to us except through bringing to our shores the products of other nations which we wish to enjoy.

In general, that industry is of no use to us except by producing things that we need; and that, if we can get those

things without the industry, so much the better, because we shall then have more time to produce yet other things which we had not previously enjoyed.

That a Chinaman who should work for nothing would therefore be a benefactor to us all, being, in fact, so far as we are concerned, a sort of labour-saving machine.

In fine, that the great improvements which the present generation has witnessed in the condition of the labourer are due to cheapened production, whereby everything we need is gained with less industry than was formerly necessary.

There can be little doubt that Mr. Newcomb's political economy may be sound, but it is the reverse of popular, at least in the United States, and probably elsewhere.

HOW TO SAVE THE BRITISH FARMER.

PROFESSOR JAMES LONG, writing in the *Fortnightly Review* upon the deluge of foreign produce on the British farmer, discusses and condemns the proposals that have been made for saving the farmer from the ruin wrought by foreign competition. This number is only by way of leading up to his own scheme, which is as follows:—

What, then, do we propose in order to place tenant farmers on advantageous terms and enable them to meet the growing competition?

1. Permanent reductions of rent. The landlord must share the newly-acquired burdens.

2. A comprehensive Land Bill.

3. Stringent laws prohibiting the adulteration of milk, butter, and cheese, cattle foods and manures, and the sale of imported as British meat.

4. Prohibition of the use of sugar in the manufacture of beer.

5. Prohibition of the sale of imported fresh milk.

6. Control of the great markets through the medium of which the producer is systematically defrauded.

First, with regard to a Land Bill. We define the heads of such a bill as follows:—

1. Fixity of tenure.

2. The absolute right to make and sell improvements without the necessity of obtaining permission. Valuers should be required to inspect every farm and record its condition before a tenant enters.

3. Fixed rent for a given term of years.

4. Freedom of cultivation and sale of produce.

5. Amendment of the Ground Game Act.

6. Abolition of the law of distress.

We must, however, soon look still farther ahead. Large farms are a mistake. In seasons like the present and the past farmers are helpless, because of the magnitude of the land they occupy. With one-quarter the acreage remedial measures would be possible, failure of crops almost impossible, if the same capital were expended in stock and manures. Our experience of small farming in the best cropped districts of the best farming countries in the world is that the fewer the acres the heavier the crops. We therefore hold the opinion that in the future—and the change will take place by degrees—small farming will hold the field in this country. No farming, however, can succeed so long as produce cannot be marketed successfully, and at this moment the unhealthiness of the London markets, in particular, is a disgrace to our civilisation. We have, in turn, been personally defrauded in the sale of meat (live and dead), butter, eggs, and vegetables—and there is no remedy.

Such, then, is our case. Competition will continue, will increase, and our experience leads us to believe that no less than the programme we have sketched will suffice to enable the farmer to successfully meet it.

MRS. FVIE MAYO writes appreciatively of Harriet Beecher Stowe in the August number of *Atalanta*. Mr. Alfred Alfieri, whose name was misprinted in our last number, continues his papers upon "The Evolution of the Piano-forte."

A MASTER BUILDER OF THE RUSSIAN EMPIRE. THE EMPRESS CATHERINE II.

THE *Edinburgh Review* publishes a very interesting article based on Walisjewski's "The Romance of an Empress." The reviewer, on the whole, is just to the Messalina of the North. Catherine, whose reputation outside Russia has been concealed by her abnormal licentiousness, was nevertheless the most conspicuous figure among the sovereigns of her age, not even excepting Frederick the Great. Even her vices were incapable of destroying her character. The reviewer says:—

A life of gross sensual vice did not wholly pervert the moral nature of this strong-willed and capable woman; she never sank to the degradation of Louis XV.

MESSALINA, AND WHY.

After all, it is probable that she was no more vicious than the ordinary male sovereigns of her age. Morality as between the sexes is a conception which does not prevail in courts, even at the present time, as we have recently been somewhat disagreeably reminded. What may be called the stud farm theory of the relationship between royalties was accepted in Russia in her time with most uncompromising frankness, as the following anecdote shows:—

Female virtue and honour were almost unknown. Catherine was for months only a wife in name; and she was gravely invited by the Russian Chancellor, and by a lady of honour chosen to direct her conduct, to provide an heir for the throne of the Czars through the instrumentality of one of the lovers already known to have secured her favours.

Speaking, as may be supposed, in the name of the Empress, the governess, the titular guardian of the virtue of the Grand Duchess, and of the honour of her consort, explained to Catherine that cases arose in which state policy must rise above other considerations; for instance, one, the legitimate wish of a wife to be faithful to her husband provided he had proved himself incapable to guarantee the hereditary succession to the throne and to secure the repose of the empire. In fine, Catherine was given peremptorily the option to choose between Sergius Soltikoff and Lev Narychikine, Madame Tchoglokooff saying she was convinced the Grand Duchess would prefer the last. Catherine met the approaches. In that case, retorted the governess, the other would be the man. Catherine kept silent. Bestoucheff, with somewhat more reserve, spoke of Sergius in the same sense.

It is in facts like these that the explanation of Catherine's private life is to be found.

THE FIRST DISCOVERER OF PUBLIC OPINION.

Notwithstanding this, Catherine achieved great things for Russia, and the reviewer points out she was the inventor of the Panslavonic idea, and the first discoverer of the immense importance of cultivating public opinion. The reviewer says:—

The idea of Panslavism may be traced to Catherine; she found marks of the Slav in every part of Europe; and the cultivation of Russian history was one of the achievements of her reign.

Quoting his author, the reviewer points out a still more signal illustration of her genius:—

All this forms part of a system—a system due to the wonderful intuition of a woman, born in a petty German court, and placed on the most despotic throne of Europe; due, too—and so better—to her clear apprehension of the great power of the modern world—public opinion. It is, we do not hesitate to believe and affirm, because Catherine discovered this force and resolved to make use of it, that she was able to play the part she played in history. Half of her reputation in Europe was caused by the admiration of Voltaire, solicited, won, managed

by her with infinite art, nay, paid for when necessary. And this reputation was not only advantageous to her foreign policy, but gave her as a ruler at home a splendour and an authority which alone permitted her to demand of her subjects, and to obtain from them, the gigantic efforts which made her grandeur and glory what they were. In this respect she was an innovator and a precursor; she forestalled the great agitators of ideas, and of men, who belong to the history of our times.

WHAT SHE DID NOT DO.

It was largely owing to her adroit manipulation of public opinion that she has become the sublime figure, colossal alike, and splendid, majestic, and attractive, which she appears to-day in the eyes of so many. However she did it, there is no doubt she achieved much, although the reviewer does not hesitate to call attention to the shadows in her reign.

She accomplished little in raising the national life of the races under her sceptre to a higher level. Her legislation and administration, indeed, were somewhat reactionary in this respect; her conduct to the Poles was atrocious, and many of the boasted creations of her reign were mythical. But she had a tendency to the liberalism of the eighteenth century, which was not without genuine fruit; and if her attempts to promote civilisation in the main failed, they were not altogether insincere.

WHAT SHE DID.

But these drawbacks cannot conceal from me the fact that she was one of the great makers of modern times.

Every diplomatist of the first rank in Europe expressed a belief that the reign of Catherine, a foreigner raised to the throne by a Praetorian revolt, would be unstable and almost certainly brief. Yet she governed Russia for more than a third of a century, enormously extended the realms of the Czars, and, until Napoleon appeared on the scene, was the most remarkable sovereign of the age. As much at least as Peter the Great, Catherine shaped the fortunes of Muscovite power; she was the real author of the Eastern Question in the numberless forms it has ever since assumed; her influence was felt in the negotiations at Tilsit, and has not disappeared to the present day, and her successors have carried out her foreign policy. Her personality stands high on the tracts of time, and all that is associated with it still possesses interest. A crowd of flatterers and lovers, as is well known, extolled the majesty and beauty of her form and countenance; she was not only a Minerva in wisdom, but a Cleopatra and an all-subduing Venus. Her stature, however, like that of Louis XIV., exaggerated too, amidst the incense of Versailles, was hardly above the ordinary height; she tells us herself she was not handsome. With perfect confidence in her own powers, she was a daring and skilful pilot in difficult crises, and she had the keen perception of the interests of the empire she ruled which is characteristic of the true statesman. She possessed, also, the genius of government, of directing, controlling, and managing men to a degree which has been hardly surpassed, and when passion and fancy did not distort her judgment, she knew how to choose subordinates of real merit.

In the *Medical Magazine* for July there is a pleasant paper, translated from the German, describing the 70th birthday of Friedrich von Esmarch, the founder of the Samaritan Association in Germany, and one of the most eminent of modern surgeons.

In the *Review of the Churches* there is a very elaborate review of Dr. Gladden's and Mr. Stubbs's books on "Christian Economics." The Rev. J. Lias publishes a summary of the proceedings of the Old Catholic Congress at Lucerne last year, and the Rev. W. J. Dawson describes "Patronage in the Wesleyan Church." The *Review* also publishes Dr. Lunn's inaugural address at the Reunion Conference.

QUEEN ELIZABETH AND THE GRAND TURK.

MISFORTUNE MAKES STRANGE BED-FELLOWS.

THE *English Historical Review* contains an interesting and out-of-the-way article describing the attempt made by Queen Elizabeth to secure the Turkish alliance against Spain when England was threatened with the Armada. The essay is based upon the correspondence which passed between the two Courts in those days, and it is very curious to find Elizabeth appealing to the Sultan on the ground that Protestants and Mohammedans are alike haters of idolatry.

THE ENGLISH AS SEMI-MUSSULMANS.

She was "The Defender of the Faith," the true faith against those idolators who had usurped the name of Christian.

To such an extent were the Turks persuaded of the similarity between Protestantism and Islam that if we are to believe a contemporary report, addressed to the emperor, Sinan Pacha told the Roman ambassador that to be good Mussulmans all that was wanting to the English was that they should raise a finger and pronounce the Eshed or confession of faith.

From a brief preliminary sketch of the relations which existed between the Turks and Elizabeth before the time of the Armada, it appears that in 1579 Elizabeth obtained permission for Englishmen to trade freely in the dominions of the Ottoman Empire. The next ten years English consulates were established at Alexandria, Cairo, Aleppo, Damascus, Tripoli, and Jerusalem, etc. It is curious to find that the first English ambassador of Turkey could think of no better gift for the Sultan than nine English bull-dogs, and a watch valued at five thousand ducats. The Turk of those days is very much what the Turk of the present day is. He was great in promising and very poor in performing, and as Spain had more money in those days than England, the power of bribing did not lie with the English ambassador.

Shortly after his arrival Harebone appears to have obtained a promise from the Sultan that if Queen Elizabeth would attack Spain in the Atlantic, he would send a great force for the same purpose to the Mediterranean coasts of Spain. The letters from Harebone and his successor, Sir Edward Barton, show that nothing was done to give effect to this promise.

WANTED, A TURKISH FLEET!

The appeal which our ambassador made to the Sultan in 1587 is a very remarkable document. He demanded the execution of a solemn treaty, in order that "for the great glory of Almighty God, the idolators, our common accursed enemies, might be extirpated by the immense power granted to the Sultan."

I beseech your Majesty by God Almighty to spare my innocency and to send, if not the whole of your great force against this idolator, at least sixty or eighty triremes to harass him in your neighbourhood from which he has withdrawn the whole of his usual army to employ it against my sovereign. As these parts of his coast are thus exposed they will be easily overrun and placed in subjection to the empire of your highness. I ask that this occasion may be employed for the glory and the increase of your empire, since my Queen upon my urging and your highness' instance will so fetter the Spaniard that he will be unable to move, and that your highness will not permit this opportunity to escape fruitlessly lest (if thou despisest His commission which my sovereign, a woman weak by her sex will fully execute) thou incur the fierce anger of God, who has created thee a mighty man & the greatest of all the princes of this world for the express purpose of destroying idolators.

ROMAN CATHOLICS AS IDOLATORS.

Our ambassador certainly did not mince matters, and it would be interesting to know what those odd English-

men, who delude themselves into thinking that Anglican Christianity is practically identical with the Roman faith, would make of this vehement appeal of Queen Elizabeth's ambassador to the head of the Mohammedan religion, in order to induce him to make war against the Pope and Spain:—

Since God alone protects His own He will so punish these idolators through us that they who survive will be converted by their example to worship together with us the true God, and you, fighting for His glory will heap up victory and all other good things.

The Turks were complimentary, but they did nothing. They declared:—

that the grand signor has always a friendly affection towards her majesty and a great desire for her majesty's prosperity. The reasons for this friendly affection are first "for the meruaile he hath of her Majesty's sex to be ruler of so valiant a people and wisdom to govern them so politikelye," and second, "as especially for that [neither] her Majesty nor hers worshippe idols as other Christians which brings them into great contempte to him & his."

But nothing could be done unless means were provided for bribing the Pasha. The position of the English ambassador in the Turkish Court in those days was not a pleasant one. The air was filled with rumours of the mustering of the great Armada, which was large enough, they said, to bring England away in ballast. Our envoy, however, did his best to hold his own, and bluffed it as well as he could. The Turks were sure, however, that England would be beaten. It was not until two months after the destruction of the Armada that news of England's victory reached Constantinople. The need for the entry of the Turks into the field against Spain was then but small, but our envoy did his best to urge the Turks into action. He lamented that if he had only a hundredth part of the money which the King of Spain had for bribing the pashas, he could do something; but secret service money was scarce in those days. Nothing was done by the Turks, who promised everything and did nothing, as they have always done.

TURKISH COMPLIMENTS TO GOOD QUEEN BESS.

All that England got out of her diplomacy seems to have been a complimentary letter from the Sultan Valida to Elizabeth. With the following extract I bring this article to a close:—

This present letter is written to the most gracious and most glorious, the wisest among women, and chosen among those which triumph vnder the standard of Jesus Christ, the most mighty and most rich gouverneur, and most rare among woman-kinde in the world, the most gracious Queene of England, which follow the steps of the virgine Mary, whose end be prosperous and perfect, according to your hearts desire. I send your Majesty so honorable and sweet a salutation of peace, that all the flocks of Nightingales with their melody cannot attaine to the like, much lesse this simple letter of mine. The singular loue which we haue conceiued one toward the other is like to a garden of pleasant birds: and the Lord God vouchsafe to saue and keepe you, and send your Maiesty an happy end both in this world and in the world to come.

CHEAP SERMONS.—The *Review of the Churches* mentions that a Christian Mission Society of Berlin, of which Pastor Stöcker is the leading member, circulates every week 130,000 sermons; 20,000 of these are sold in Berlin:—

These sermons are published in eight-paged octavo form, and contain also an intractus, a hymn, a prayer, and a benediction. The sermons are from the pens of the most gifted evangelical lights of the German pulpit, living and dead. They are sold at 1-9th of a penny each.

THE WIFE OF THE PRETENDER

THE STORY OF MARIE SOBIESKI.

THE *Nouvelle Revue* of the 1st of July contains an article which should form an interesting chapter in the history of the Stuarts, for in it Count Wodzinski tells at length the story of the Old Pretender's marriage to Mary Clementina Sobieski, the grand-daughter of the great Polish hero of that name.

A POLISH BEAUTY.

This lady, who came so near to becoming Queen of England, spent her youth at Olaw, a little town in Silesia, for it was there that her father James Sobieski made established himself with his wife and young daughters—three roses on one stalk, as they were styled by a poet of the time. Mary Clementina, whose second name by the way came to her from her godfather, Pope Clement the Eleventh, was seventeen years of age, and already exceedingly beautiful, when a certain James Murray, a Scotch gentleman in the service of the Pope, arrived at the castle of Olaw to ask for the hand of Sobieski's youngest daughter for James Stuart, then styled the Chevalier Saint George. It is said that the Pope, who had an equal affection for both young people, had long wished the marriage, and even before the subject was publicly mooted the Chevalier Saint George always wore round his neck a miniature of his future betrothed.

A ROYAL LOVE LETTER.

The Pope's envoy brought with him a quaint Royal love-letter, which doubtless laid the foundation of the sincere and loyal affection afterwards borne to the Pretender by his wife. "Madame," ran the epistle, "The incomparable graces of your person, the eminent qualities of your wit and of your heart have long inspired in me the truest admiration. May I hope that you will not repulse him who hopes to henceforth love you alone. My supreme wish is to see you happy. Your virtues will draw down a divine benediction on my cause, and will redouble the affection and ardour of my subjects."

"THE COURSE OF TRUE LOVE, ETC."

But the young Princess was destined to go through many perils and trials before she finally met her lover. As it was obvious that the Chevalier St. George could not come to seek her at Olaw, it was arranged that the Princess and her mother should go to meet him at Bologna. George the First, King of England, was then the close friend and ally of the Emperor of Austria, and although Mary Clementina and her mother travelled incognito and under an assumed name, they were both arrested at Innspruck, and informed that the Emperor Leopold had sent them a message saying that all thought of the Stuart marriage must be abandoned. The Princesses, however, never wavered, and the two unfortunate ladies spent a dreary autumn and winter shut up in an Austrian garrison, whilst the Pope in vain attempted to soften the heart of the Emperor. Meanwhile, the Chevalier, who seems by this time to have worked himself to a perfect frenzy of affection for his unknown betrothed, suggested to her parents, her pontifical godfather, and herself, the possibility of her escaping from her quasi imprisonment and making her way disguised to Italy, where he could ultimately join her. After much hesitation the little Princess consented to her lover's plan.

THE POPE AS MATCH-MAKER.

Her parents, as may easily be imagined, found it more difficult to do so; but they at last gave way in deference to the Pope's wishes, for Clement the Eleventh seems to have been from the first determined to give his god-daughter a chance of becoming Queen of England. An elaborate plan was accordingly arranged by the Pretender himself. A certain picked number of men belonging to the "Royal Irish," a Stuart regiment then in garrison at Schletstadt, took part in the rescue and journey, officered by a Major Gaydon. Two ladies devoted to the Stuart cause acted as chaperones to the Princess, and a little comedy was arranged, by which it was to appear that, during the journey, the Princess was to pose as belonging to a family of wealthy travellers crossing the Tyrol.

RESCUED.

The rescuing party assembled at an inn opposite the castle where the two Princesses were confined, and on the fateful evening, after a delay of one day, obtained, we are told, by Mary Clementina's mother, the Princess crept out, met her future husband's faithful band of friends and servants, and the party started in a heavy six-place coach for their long and perilous journey. At last the party reached Venice; two days later they arrived at Bologna, where they were received with great pomp by the Cardinal Legate. It was there that "faithful Murray" met her, bringing from his master as an engagement ring that which had been worn by James the Second on his wedding day to Mary of Modena.

MARRIED BY PROXY.

By special permission of the Pope the Princess, whose troubles were by no means at an end, was married by proxy to Murray in a simple white gown, by special desire of her future lord and master. From that day Mary Clementina bore the title of Queen of England, being always styled by the Pope "Your Majesty." She then entered the Ursuline convent, and waited patiently for the return of her husband. At last he came back from his disastrous Spanish expedition to his faithful bride, and during their all too short married life it is said that he had but one reproach to bring against her—that of her exceeding piety and love of God. To her two sons, Charles Edward the Young Pretender, and to the Duke of York, afterwards Cardinal of the Roman Church, she was much devoted, and it was owing to her efforts that they were both brought up in the Roman Catholic faith rather than as Anglicans, which their father would at one moment have preferred.

BURIED IN ST. PETER'S.

The heroine of this romantic episode died at the age of thirty-four in a Roman convent. Curiously enough her dead body was treated in more queenly fashion than she had ever been herself during her short life, for although she had asked to be buried in the Dominican habit, her wishes were disregarded, and round her corpse was wound a purple mantle, while a gold crown was put on her brow; and so, with a sceptre in one hand and a golden apple in the other, Mary Clementina was buried in St. Peter's, the Pope placing on the stone which marked the spot—

CLEMENTINA,
MAGNÆ BRITANNIÆ,
FRANCIÆ ET HIBERNIÆ
REGINA.

AN INTERVIEW WITH MRS. BUTLER.

THE APOSTLE OF WOMANHOOD.

IN the *Young Woman* for August Mr. Dawson publishes an interview with Mrs. Josephine Butler, of whom he speaks in terms of admiration only qualified by Mrs. Butler's own personal remark that she was tired of being praised in the newspapers. In the course of the conversation Mrs. Butler took occasion to say several things concerning women both young and old.

THE GIRLS OF THE PERIOD.

Taking the young women first, Mrs. Butler, when asked to give them a message, said :—

The one thing I feel is their lack of dignity. The sense of their own worth should be impressed upon girls in all ranks of life. They are too cheap, they are made cheap, and they allow themselves to become cheap. They ought to remember that they are queens born, and that they must comport themselves as such. I always try to infuse into my nieces the sense of their own great worth and dignity as women. Nothing can make woman worthless. It is my intense respect for human nature which has carried me through all my trying work. The most brutal of men, the most horribly savage—and I have had to do with some dreadful characters—I can in a manner respect. I say that truthfully. The sense of womanhood and the value of the individual ought never to be lost sight of. Girls should certainly be equipped to earn their own living. They should never be taught to look to marriage as a necessity. I would not discourage the romantic feeling; a girl's desire to have some one all her own really to love—you can't expel that from the heart of a woman—but it must not be allowed to become morbid, and a woman ought to be able to live without it. The more independent young women are, the more will they be able to find real happiness in marriage.

IN PRAISE OF MARRIAGE.

But Mrs. Butler is no enemy to marriage; on the contrary, she deplores the fact that so many workers of the public should have been either unmarried or unfortunately married. She says :—

I notice there is a tendency in some people not to appreciate and value the marriage relation—probably it is not altogether their fault. I cannot understand family life being supposed to stand in the way of successful work, and children being looked upon as a hindrance and encumbrance. Children give wider sympathy, greater power, and as a mother I have been able to speak as I otherwise could not have done. My children have never been in my way,—my sons are now my greatest reward. All the time we were engaged in this special work my sons lived at home, until they went to the universities. They have been a great happiness to me. So far from our work being an injury to them, from their earliest years it has been nothing but a blessing. The knowledge that their father and mother were working against this particular evil was like armour to them, and made it impossible, humanly speaking, for them to take any other side.

ITS INFLUENCE ON LIFE.

"I am getting old," she said, "and may not have many years before me, and I want to say this: In looking over the army of women-workers, I have been struck with the fact that a very large proportion of those who take up great moral and social causes are unmarried, and that those who are married have sometimes been unhappy or unfortunate wives. There are many exceptions—these are usually cases of ideal marriages. I love my fellow-workers, and they love me, and nothing could be dearer than the friendship between us; but what I so deeply regret is that comparatively few of them can follow me into the wonderful sweetness and sympathy of family life. There are various powers and influences at work in a woman's soul. She begins with her own convictions and principles, then some unhappy circumstance perhaps pushes her along a certain line. My case was absolutely the opposite of that. If I have been anything I have been a wife and

mother, and that has been to me more than any public work I have ever done."

A DOUBLING OF FORCE.

There is a quickening impulse, and of a kind superior to any others, in the union for the public good of two souls, husband and wife. There is a vital force, a family force, which is greater than the individual force—it must be, because it is doubled. No one knows how much of that force I owe to my husband and my family, and this happy relation was brought about and realised by high principle. That has been my life's experience. I have just written the life of my husband. Our married life was an idyll all through, and at the end much more romantic and beautiful in every sense than at the beginning. If I have anything to impress upon the world now, it is that—the sublimity of that union at its best. It might be much oftener realised than it is if people would take marriage in the right way. They must not expect to find happiness ready-made; they have the making of it in their own hands to a great extent. People are so dreadfully impatient. Of course, there are often faults on both sides; but there is a tendency to rebellion, instead of heroic endurance, and making the best of it, and holding up marriage as a very sacred relationship.

WHY WE SHOULD GO TO SCHOOL TO JAPAN.

THE REV. S. A. BARNETT, in the *Fortnightly Review*, has an interesting article concerning the "Poor of the World" in India, Japan, and the United States. The condition of the poor, he thinks, in India, is very bad, and in America it is rather worse. He says :—

The Americans have tried to relieve the poor, but they have let their Government become corrupt, and the penalty is written on the broken lives and bitter passions of the poor.

It is only in Japan that he finds any consolation in the course of his tour :—

In India we had been depressed by the hopelessness, in China by the ugliness, and in America we were to be depressed by the wickedness which accompanies poverty; in Japan we found the poor touched by friendship into hope, and real sharers in the national life.

What is the reason that Japan has no poverty problem? One reason is probably to be found in the land system, which has given to every worker a holding and encouraged him to supply his wants by his own labour. Effort has thus been developed, and wants are limited. Another reason lies in the rational taste for country beauty. Nowhere else are parties formed to visit the blossom-trees, and nowhere else are pilgrimages simply for the sake of natural beauty. A country life has, therefore, its own interest, and men do not crowd the cities for the sake of excitement. There is too in Japan a curious absence of ostentatious luxury. The habits of living are in all classes much the same, and the rich do not outshine the poor by carriages, palaces, and jewellery. The rich spend their money on curios, which, if costly, are limited; and the most popular agitation is that against the big European houses which ministers build for themselves. Wealth is thus not absorbed, and is more ready for investment in remunerative labour. The last reason which occurs to the mind of a traveller with comparatively few opportunities for forming opinions is the equality of manners in all classes. Rich and poor are alike courteous. It is not possible to distinguish employer from labourer by their behaviour; all are clean; all are easy; all are restrained. The governor lets his child go the common school, and sit next to the child of the casual labourer, certain that his child will pick up no bad manners, and get no contamination in thought or in person. This equality enables rich and poor to meet as friends, and gifts can pass without degradation. The rich nobles in the country, just as the university men whom we met in Tokio, are thus able to give to those whom they know to be in need, and friendship becomes the channel of charity. The question is, will this survive the introduction of the industrial system? It is possible that some may, and that Japan may teach the West how to deal with the poor.

MR. WALTER BESANT AT HOME.

A NOVELIST ON LITERATURE.

THE first place in the *Young Man* for August is given to the interview with Mr. Walter Besant, who, according to his interviewer, carries with ease his fifty-five years and his thirty books. A genial, fatherly, practical man, he would rather spend his time in doing useful work and making people happy in this world, than in speculating about the next. He has several hobbies, amongst others that of collecting autographs, and he keeps the signatures of everybody neatly tied up in bundles.

THE PRIZES OF LITERATURE.

Speaking of the Authors' Society and the earnings of literary men, Mr. Besant makes the following assertion as to the prizes of literature:—

I cannot make people believe that there is such a thing existing as literary property. When, for instance, I stated that over fifty people in this country and in America were making more than a thousand a year by literature, my estimate was absolutely derided. We have since then ascertained that hundreds of people are making over a thousand a year by literature of various kinds; at least thirty in this country alone are making over two thousand; at least six or seven are making over three thousand; and I should say that at least one or two are this year making not less than four thousand. In every profession a thousand a year is a prize; two or three thousand a year is a great prize. From the peculiarity of the literary profession there can never be many of these great prizes at the same time; but there will always be opportunity for everybody, and there is plenty of room at the top.

MR. BESANT'S OUTPUT.

No doubt this is true, but it is frightfully crowded at the bottom. Speaking of his own experience as a writer, Mr. Besant said that he wrote eleven novels in collaboration with James Rice, eleven by himself since, besides four books on French literature, two books on London, and a couple of biographies. He has written no fiction for the last nine months, but is engaged for two years to come. He is to begin a new novel as soon as he returns from America this autumn. He dictates nothing, but writes all with his own hand; typewriting, he says, is like talking through a box. He writes everything three times over.

CONTEMPORARY FICTION.

Speaking of the novels of the present day, he maintains that the novels produced by Bentley, Chatto, Macmillan, and Longman are far superior as an average to anything that has ever been done before. Speaking of contemporary romance writers, he says:—

I am sure that in fifty years time the world will put Stevenson, Thomas Hardy, Rudyard Kipling, and Barrie—who to my mind are, intellectually, our four best living writers—on a level with any writers of fiction we have had. Especially I admire Kipling—I love Kipling—he is a real genius, that fellow. Barrie is a beautiful writer. Stevenson at his best is a wonderful writer—only he has got to be at his best. Apart from these men, we must not forget that Blackmore wrote "Lorna Doone," that Black wrote "The Daughter of Heth," which to my mind is one of the finest novels in the language—and, I would add, that Rider Haggard wrote "She," which as a piece of pure imagination is almost without parallel.

The modern novelist has at least a stimulus which his predecessors never possessed owing to the expansion of the English-speaking world.

TO LITERARY ASPIRANTS.

When asked concerning the pursuit of literature as a profession, we read as follows:—

"I should strongly recommend the young writer," Mr. Besant continued, "to keep himself independent of literature,—to

follow some profession, to become a journalist, or do anything in order to be independent. Because, to be dependent on literature, unless you are a very good man indeed, means a most wretched life." In illustration of this Mr. Besant told me of a case, which came under his own observation, of a young man who started with very good prospects indeed. He brought out a book which was very well reviewed, and very well received, but being his first book he did not make much money out of it. Having begun life as a clerk in the City (his father was a clerk before him) he did not know much of the world or society; consequently, his range was limited, and his second book was quite a failure. "Since then," said Mr. Besant, "he has been living (!) by literature. Two or three years ago, when I last heard of him, he was receiving from fifty to seventy shillings for a novelette of thirty thousand words, and was living with his wife and children on an income of less than a pound a week. Now, if he had kept his berth in the City and bided his time, he might have become a successful writer. But to cast yourself on the sea of literature, in most cases means certain wreck." Mr. Besant certainly has practised what he preaches. His first novel in partnership was a success; every one afterwards was a success; he has been successful all along, but not until six or seven years ago did he feel justified, he told me, in giving up a post worth three hundred a year. "I did not like to be on the sea of letters without any kind of anchorage. Three hundred a year is at least bread and cheese; with that you can be independent, and not obliged to write for a pittance."

THE PEOPLE'S PALACE.

Mr. Besant was evidently in a very genial mood, and not even the comparative failure of the People's Palace could disturb his optimistic mood. He said he was not satisfied on all points, but he was satisfied on some:—

The educational side is splendid, thanks to Mr. Low, the head of that department, and the musical side is very fine indeed. It wants at this moment, above all things, a head like Sir Edmund Currie, who would be always there directing and watching it; and I think on the recreative side it is languishing for want of such a head. Also, I wish that the Library could be kept up with greater liberality. The place wants an income of two thousand a year more than it has got.

The Burning of Servetus.

MR. C. W. SHIELDS, in the *Presbyterian Reform Review* for July, publishes a long, carefully written article on the Trial of Servetus, with the object of proving, first, that Servetus got very little more than he deserved, and, secondly, that Calvin was not to blame for his burning. Calvin's idea was that justice might have been satisfied if Servetus had been beheaded. Mr. Shields says:—

The grounds of this dreadful sentence have now been plainly revealed to us. Here was no ecclesiastical court of the Presbytery intent on defining heresy against orthodoxy within the breadth of a hair; but the highest tribunal of the republic set for the defence of justice, order and virtue. And the offences charged and proved were not theological errors against the five points of Calvinism, but sins against the essential Christian faith, together with political crimes such as are still defined in our laws and punished by our courts; blasphemy, so shocking to both civilians and divines that it seemed to shake the very foundations of society; sedition, which was already breeding schism, tumult and revolution in the city; and conspiracy, of which there was evidence enough in the Council itself as the trial proceeded. In a word, it was neither zeal for orthodoxy nor devotion to Calvin which prompted the majority of the judges to order the funeral pyre with which his name has ever since been associated. It was simply their fixed determination to be rid of a pestilent fanatic who had embroiled Geneva in anarchical strife, who had been outlawed in every country of Europe which he had entered, and who was at last condemned by the united voice of Catholic and Protestant Christendom as an enemy to the whole existing civilisation.

BJÖRNSTJERNE BJÖRNSSON.

THE SCANDINAVIAN NOVELIST AT HOME.

Mrs. TWEEDIE, who gives the account of Ibsen, printed in another page, contributes also to *Temple Bar* her impressions of Björnsterne Björnsson.

Here is her description of the great novelist:—

THE MAN AS HE LOOKS.

Björnsson is a big man of powerful build. His well-knit form denotes great physical strength, and his splendid head signifies great mental power. The face is curiously round, and the high cheek-bones and massive jaw have a peculiarly northern air. From his broad brow he wears his hair brushed straight up. The hair is now almost white, although it was red in his youth, and he still has great quantities of it. As he moves his head in his emphatic speech, the massive mane of hair moves and shakes and reminds one of a shaggy lion. His face is clean-shaven except for a small pair of reddish whiskers. He is a fine-looking man with his burly build and keen piercing blue eyes. He is very short-sighted, and is never seen without spectacles. He has a very determined thin mouth with a kindly smile, very characteristic of the man, who is stern and grave and very tender-hearted.

HIS LOVE OF MUSIC.

Björnsson is devoted to music; although no performer himself, he is passionately fond of listening.

"Nothing gives me keener enjoyment than listening to good music. Music I believe elevates the soul, instead of degrading it, as Leo Tolstói would make us think. Anyway, music to me is happiness, relaxation, awe, and inspiration. Much of my best work has been written after listening to good music."

Several of his poems have been set to music by his friend and compatriot Grieg, and Björnsson has even written oratorio to Grieg's music, with great success. Although Björnsson has travelled much, he has only once been in England, and that was only for a week many years ago.

"Perhaps I may go again some day, for I am an apostle of Herbert Spencer's and a great reader of your literature, although I speak the language very badly. I am over sixty, and I am too old to make new friends, more especially when I do not talk their language. Besides, I have still a great deal of work to do before I die, and not much time to do it in. My work is my life; the more work I have in hand the happier I am! Music is my amusement and digging is my recreation. You smile when I say digging is my recreation; but it is so. Your Gladstone fells oaks; I dig with a spade, and I am much prouder of having my name on a spade than in a book."

He works with his own hands at his charming home at Gudbrandsdal, and he is very proud of having managed to bring into cultivation what was once only a crop of stones.

"You see I was brought up among our peasantry. My father was a parson, and I too was intended for the Church. Strangely enough my first literary productions were hymns; but that was very many years ago"; and he added, "I think the most perfect and charming life is to be found in the simple peasant home. So-called educated society is not real, it is thoroughly artificial, artificial to the heart's core."

HOW HE WORKS.

Of his method of working Mrs. Tweedie gives the following account:—

When the household is settled and things have assumed the usual routine, Björnsson writes all the morning until about two o'clock, at which hour the family dines, and after that he considers the chief part of his day's work is done. He is not at all methodical and tidy like Ibsen; but then he has not so much time on his hands; his whole life is a rush from morn to night.

Björnsson always likes to be alone when he is writing, and in each of his little country seats he has his own writing-room and large plain table. He thinks out all his scenes and situations, and even decides upon the conversations of his characters before he puts pen to paper, and during all this planning and arranging of his chapters he always walks

about. Up and down, backwards and forwards he trudges, muttering to himself; but when he has once decided on chapter and verse, he sits down and dashes it off with great rapidity, resulting in some very untidy and illegible MS., about which some very curious stories are told. But for his wife, the printer would probably never decipher what he writes; but Fru Björnsson copies nearly everything for her husband, then he corrects and alters it, and she copies it all over again before it goes to press. She is of the greatest assistance to him in this way. How many wives have helped their husbands in their work, receiving no individual thanks from the world outside, but happy and content in their husbands' reflected glory!

Mrs. Tweedie bids fair to make her name as a contributor to magazine literature.

Hamlin Garland: a Western Novelist.

In the *Literary Northwest*, Mrs. Bird devotes the first paper to "Hamlin Garland," whose novel she regards as a new power in literature, whose theories of art are wholly antagonistic to the English old school documents. She says:—

Hamlin Garland is a realist or veritist. He believes that there should be no plot in a novel or drama; that authors should deal simply with character. While Crawford describes the growth of love and its effect upon character as an over-mastering passion to which every other emotion bends, Garland takes any scene, however homely, that contains dramatic situations, and describes it exactly as it might have happened in real life, regarding love as one of the numberless incidents of life, and therefore assigning to it a subordinate place. Garland regards W. D. Howells as the greatest novelist of the Realistic school, but he recognises no master save life and no criterion save truth. W. D. Howells's "An Undiscovered Country" was a revelation to our author, and reached him in a novel manner. He saw it on the stand of a country bookseller, and inquired about it. The storekeeper had bought it, supposing it was a book of travels, and was much disappointed to find that it was an unsaleable novel. Garland took it and read it. To him it still seems so fresh, so modern, so original, that he regards the reading of that story as an epoch in his life.

This is Mrs. Bird's description of the novelist's appearance:—

About the average height, broad-shouldered and muscular, with grayish-brown eyes, brown hair and beard, he has the unassuming air of a student and man of letters. He is easy of approach, his manners are winning and voice persuasive. His age is about thirty-three years, and he is still a bachelor, whimsically excusing himself from the bonds of matrimony by declaring that he cannot afford to marry till we reach the single-tax millennium. As a lecturer, his manner is unembarrassed and conversational rather than rhetorical, while the matter contained in his lectures is striking and original. His recitations of his own poems and of scenes from his novels are exceedingly happy, and display his magnetic power more than as a lecturer. As one would naturally surmise from his novels, he is fond of athletic sports, can pitch a ball with the curves of a professional, knows how to manage a boat or a bicycle with skill, and is a fearless rider.

The most sceptical pessimist cannot deny that, in his four-fold career as lecturer, essayist, poet and novelist, Hamlin Garland has made a profound impression upon the West, nor that he is the most ardent and enthusiastic writer of the school of veritists. He is the forerunner, the awakener, the messenger who proclaims the springtime of a Western literature.

JULIAN HAWTHORNE describes the banquet of royal beauty which is spread by the "Lady of the Lake at the Fair" at Chicago in *Lippincott's Magazine*. He says that on an average he walked fifteen miles every day he spent at the exhibition.

HENRIK IBSEN.

THE POET AT HOME.

Mrs. ALEC TWEEDIE has an interesting article in *Temple Bar* upon the two great Scandinavians—Henrik Ibsen and Bjørnstjerne Bjørnson. In the early months of the present year Mrs. Tweedie called upon Ibsen at his own house in Christiania, and interviewed him there for the benefit of the readers of *Temple Bar*.

IBSEN AS HE IS.

She says:—

The doctor is a small man, thick set—one might almost say stout in build. His head is splendid. The long white hair is a tangled mass of glistening locks. It is brushed straight up from an unusually high forehead, and stands out as a sort of frame to the face; indeed, the face is completely framed by white hair, for Ibsen wears whiskers and a beard under the chin, the chin itself and upper lip being clean shaven. By this arrangement the mouth is clearly visible—and it is a very curious mouth. The upper lip is short, and the mouth is so thin and decided that the top lip hardly shows at all. The mouth is very determined, with a pleasant smile when talking. He always wears glasses; and whether from their use or from short-sightedness, the eyes themselves are somewhat sunken, and much hidden by the shaggy eyebrows. It is a keen face, not actually handsome, but impressive, and denotes power and penetration.

She also adds that he wore a complete suit of shiny black, with a double-breasted top-coat, some of the buttons of which were the worse for wear. His tie was of white satin. In manner he is very quiet and reserved, speaking German very slowly and deliberately. He is of German descent, and very sympathetic with Germans, although he thinks Norway the most lovely country in the world.

WHAT HE THINKS OF ENGLAND.

He has never been in England, nor does he intend to go, because he does not speak the language, and, therefore, has not the means of penetrating the heart of the people, which is the one thing he desires. Yet he says he should very much like to go to England—

Because English people and English books interest me strangely; more especially I would like to see your old men. In all other countries the best work is done by men between forty and fifty years of age; in England, the best work is done by much older men, and a man of seventy or eighty is often still in his prime. I would like to see such men as Gladstone and Salisbury, Herbert Spencer and Tennyson.

HIS MODE OF WORK.

Mrs. Tweedie says that Ibsen is almost as neat and as faddy as an old maid. Everything was in its place, and all the MSS. were fastened up in elastic bands. He is always punctual to a second; writes a clear neat hand, walks and moves slowly, and is never in a hurry. He takes some two years to write a play, and he writes it out so often that, when it is finished, not a line of the original often remains. He is absolutely uninfluenced by the bustle and turmoil that he sees all round about him. As to his habits, Ibsen said that he was getting lazy, and did not read much. He looked over the papers every day, and read a book now and then.

SOME ODD HOUSEHOLD GODS.

By the side of the ink-pot, on the table on which he writes his book, there stands a little tray, and on that tray one of the small carved wooden bears so common in Switzerland. Beside it was a little black devil, holding a match, and two or three little cats and rabbits in copper, one of the former of which was playing a violin. Mrs. Tweedie asked Ibsen what was the meaning of the strange group. He replied:—

"I never write a single line of any of my dramas without having that tray and its occupants before me on the table. I could not write without them. It may seem strange—perhaps it is; but I cannot write without them," he repeated; "but why I use them is my own secret," and he laughed quietly.

His writing-room is bare and very unpretentious. The drawing-room and dining-room are covered with pictures which he carries about with him wherever he goes. Mrs. Tweedie says what is surely an exaggeration—that Ibsen has probably made more money with his pen than any other writer.

For a sketch of Ibsen's life, and the struggles by which he rose to his present position, readers must refer to the facts in *Temple Bar*. Ibsen now lives very quietly, taking no part in politics. After his morning work is done, he takes a little walk before dinner. After dinner, which is at three, he strolls down to the hotel, where he sits down to coffee or beer, and reads the news papers for an hour or two.

Last year his son Sigurd married Bjørnson's eldest daughter, and last month the two eminent Norwegians became grandfathers.

Mr. Edmund Yates.

MR. EDMUND YATES is the subject of an illustrated interview in the *Strand Magazine*, which contains the usual allowance of views of the house in which the subject dwells. It was first intended that Mr. Yates should enter the Church, but when he was sixteen years old he entered the Missing Letter Department of the General Post Office, and remained there exactly a quarter of a century. These were days, he says, of real happiness:—

"I did not want to sit at the Post Office all my life," said Mr. Yates, "and I began to look about me for a fresh pasture where fame might be gathered. It was the reading of 'Pendennis' that suggested journalism, and my first real effort was a set of verses—the idea for which came as I sat in the family pew in church!—which were accepted by Mr. Harrison Ainsworth, the proprietor and editor of *Ainsworth's Magazine*. My first paid engagement was on the *Court Journal*, at the munificent salary of £1 a-week!" Work soon began to come in. The young author's talent was recognised and his pen appreciated and paid for. His hours were respectable—ten till four—at the Post Office, but they were drawn out into the early hours of the morning in his anxiety to succeed. His pen was soon employed in all the leading newspapers and periodicals of the day, and he became dramatic critic of the *Daily News*. His first novel was "Broken to Harness." He was editor of *Temple Bar* at the time, and having failed to find an author to write a serial, buckled to himself, the result being a work of excellent merit—followed by such dramatic productions as "Black Sheep," "Wrecked in Port," "The Forlorn Hope," etc.

Madame Blavatsky.

In the June number of "The Proceedings of the Psychical Research Society" Dr. Richard Hodgson replies to Mrs. Besant and Mr. Sinnett in a paper entitled "The Defence of the Theosophist." Speaking of Madame Blavatsky, he says:—

With her keen insight into human nature, she was well aware that whatever prepossessions I had at the outset of my investigation were distinctly in her favour, and in the last interview which I had with herself and Colonel Olcott she declared that the Brotherhood was unwilling that the world should at this time believe in their existence, that I had, in fact, been practically guided by the Brothers themselves, that she knew I had done the most possible for her sake, that there was no alternative but for me to reach the conclusion which I had reached, that it was partly the result of her own bad Karma, that she deserved the fate which had overtaken her, but that some day in the far distant future I might come to believe that after all she was innocent. With me personally, face to face, she was courageous unto the last.

M. DE BLOWITZ AS ARCHANGEL.

By A WORSHIPPER.

IN *McClure's Magazine* for July, Mr. W. M. Fullerton gives us an illustrated character sketch of the one great man left in Europe since the fall of Prince Bismarck. Mr. Fullerton, faithful to the principles laid down in our character sketches of describing a man, not as he seems to his enemies at his worst moments, but as he seems to himself at his best, paints M. de Blowitz as little short of an archangel.

HIGH FALUTIN'.

Mr. Fullerton says that M. de Blowitz is the creator of a special environment, and is in himself in his own way a final cause. He is one of the men who have contributed most to the shrinkage of this planet, and he is besides one of the most individualistic of contemporary institutions; he is more powerful than any of the diplomatists; the *Times* at its best is only the accidental projection, a kind of chronic double of himself. He is a large man; he likes large air, large rooms, large landscapes, and large and general ideas; in fact, if he shrinks the world much more he will have to go to a larger planet in which to find room for his capacious personality. All this, of course, we were prepared to hear, but it does somewhat stagger even the most obliging of believers to be told that M. de Blowitz eternally lives in the air of a journalistic City of God; such, however, is Mr. Fullerton's assertion, and we, of course, are all very glad to hear it. He describes M. de Blowitz's life at home and at his seaside retreat on the Norman coast.

THE GREAT MAN IN PARIS.

Here is Mr. Fullerton's description of his hero's daily life in Paris:—

The people who come to see him—the deputies, the ministers, the ambassadors, the writers, the artists, the simple *gens du monde*—come more often not to his office, but to his warm and hospitable home. Here, in one of the streets that wind about the Star Arch at the head of the Champs Élysées, he receives all the world, rather as the charming gentleman than the historic journalist de Blowitz. The centre—I must add the admired centre—of a devoted family circle, he discourses at his dinner-table of the serious events of the day, volubly, picturesquely, and with conviction. Yet he is always ready to listen, and even to alter his opinions at a moment's notice, though that notice must be good. While he himself makes the coffee, the talk becomes less exacting and more general. Often he tells you of his pictures, and points out to you the panels set into the wall of the room, works of his friends, great canvases by M. Clairin or Mme. Sarah Bernhardt; and one, a sunny view of the Norman house on the cliff, by M. Duphot. After dinner in the private study, with its high walls covered with paintings and souvenirs and autograph photographs of the greatest names of France, you smoke in the arms of your easy-chair, the wood fire burning brightly in an ample chimney; while your host, propped by divan cushions, and with one leg curled under him, drops grandly into pleasant reminiscences. One has visions of Bagdad. After an hour like this, you wonder when M. de Blowitz works. But he has been working all the time. He has been thinking in one half of a very capacious brain and talking from another. The chances are that he will have planned a column article for the *Times* newspaper, left you for a half hour to rummage in his books while he dictates the article, telephoned for his carriage to await him at nine o'clock in the court below, and asked you to accompany him to the opera—all before he has finished his cigar. But then the cigar is a remarkably good one, and knows not, as is the case with ambassadorial nicotine, the protective customs of France.

H.M. KING BLOWITZ AND HIS COURT.

At the seaside he has constructed a residence in which he can live the ideal tranquil existence of an

English country gentleman. But M. de Blowitz could not support existence in that fashion all day, so he varies its monotony by holding a little court on the seashore:—

Towards three o'clock in the afternoon, indeed, almost daily, M. de Blowitz has an amiable habit. He walks down with members of his family, and the guests who are staying with him, to the pretty bathing-cabins, in front of which stretches an improvised awning, and, picturesque in his coloured flannels, he sits himself down with a cigar to watch the bathers. He, the most distinguished of European critics, is here and now the object of many curious and admiring observations. He holds here a little court on the shingle beach. Brightly dressed women gather to him from every point of the compass; while he who has his emissaries in every quarter of the world, and whose subtle influence is felt at each episode of the European movement, gives himself up with pardonable indulgence—under the ample umbrella—to the pretty trifles of glib women's charm and chatter. Before he has enjoyed enough, and obedient to one of those harmless devices in which well-taught men of the world often indulge, he retires from this charmed and, as I can affirm, charming circle, and climbs to the great villa on the cliff. There are letters to be written and telegrams to be sent to Paris, and perhaps an article meditated during the afternoon.

Flies and Infection.

SURGEON-GENERAL SIR WILLIAM MOORE, in the *Medical Magazine* for July, publishes an article on "Flies and Disease," which is not very pleasant reading. He says:—

I cannot avoid thinking, that one medium by which diseases are spread, has been regarded with too much indifference, or has been altogether ignored. This is the dissemination of diseases by flies.

In proof of this he begins by telling us that on one occasion—

A dead dog was thrown into a ditch in the parish of Cortal, and left there. The carcass was soon covered with flies, which then spread over the place, an epidemic of anthrax being the consequence.

Among the diseases which he believes are spread by flies, especially in the East, are leprosy, mange, cholera, and ophthalmia, and worms in the nose is another horrible disease which flies convey from camels to human beings. Sir William Moore writes chiefly concerning the plague of flies in India—

In most Indian towns when exposed for sale the meat is black with clustered flies, and a fly may have recently come from something not less dirty and disgusting than the evacuations of a cholera-stricken person. In India, especially during famine seasons, I have seen cholera-stricken persons on the road sides surrounded by flies. Sawtschenko has investigated this subject. He found that in the bowels and excrement of common flies, fed with pure culture of cholera, the bacilli could be demonstrated as late as the fourth day. Similar results were obtained when flies were fed on cholera excrement. Also that when flies were fed upon sterilised broth, after the bacilli had been supplied to them, immense quantities of bacilli were found, indicating that they had multiplied in the body of the flies.

That ophthalmia is spread by flies there can be no manner of doubt. Every traveller in the East must have seen people walking or sitting about with inflamed eyes, not even troubling to brush the flies away which swarm round the eyes. This is especially the case with children.

Unfortunately, Sir William Moore does not seem to have any suggestion to made as to how the flies can be prevented doing their evil work.

VERDI AT HOME.

THE *Gartenlaube* (Heft 7) contains an interesting article on Verdi by Herr Woldemar Kaden, who paid a visit to Verdi-Land, and now gives us a picture of Verdi as a man—Verdi at home.

BIRTH.

Those who travel from Piacenza to Bologna, says the writer, pass close by Verdi's home, for the white villa of Sant' Agata lies not far from Roncole and Busseto. Roncole is a poor little hamlet occupied by some 1,200 peasants, but it was in this miserable nest that a young couple settled down at the beginning of the century and contrived to earn an existence—the husband by selling sugar, coffee, etc., to the peasants, and his wife by spinning. Here on Oct. 9, 1813, Joseph Fortunin François Verdi, as the register has it, was born.

EARLY TRAINING.

There do not seem to be any very authentic stories of any marvellous musical proclivity on the part of the child, but his biographers are pleased to relate that he, like Mozart, heard music in the rustling of the waters and the trees, and learnt his first sweet melodies from the birds. It is certain, however, that the inhabitants of Roncole, like other people all the world over, sought consolation in music, and that the work of consolation in this instance was performed by the old schoolmaster, who was organist at the church, or by an itinerant violinist who played at the door of Verdi's home and made a deep impression on the boy. A touching story is told of the master, thirty years later, after he had founded his villa at Sant' Agata, discovering the old violinist playing at his gate, and he still remembers with gratitude the poor musician who not only roused his musical gifts, but counselled his father to put him to music. Verdi's training was begun on a wretched instrument which the father managed to acquire out of his small savings from a neighbouring priest; but of this piano more anon. When he was ten he was already organist at the church, and the organ on which he played still remains as a relic of these days, while some hieroglyphic inscriptions on the beams, cut by the boy with his pocket-knife, further testify to his early performances in the church.

SANT' AGATA.

From this little church and its old organ to Sant' Agata is a far cry. The villa which is Verdi's present home was purchased in 1849, but since then it has been gradually rebuilt, and many additions have been made to it, until it has developed into a charming and inviting whole. Here its owner passes six months of the year (the other half is generally spent at Genoa) with only a few peasants for neighbours. Many must indeed wonder how he came to choose such an insignificant site and such monastic-like seclusion for his home; but for Verdi the land of his birth and of his childhood has a strange fascination. The house is surrounded by garden, park, and vineyard. But it is of his horses that the composer is especially proud, the breed he favours most being named after him. He is also passionately fond of flowers, and at five o'clock in the morning he may be seen walking in his garden and talking to the old gardener, or cutting flowers for the table. At seven he takes his *café-au-lait*, and at half-past ten the bell rings for a more substantial breakfast. At two he betakes himself to business, and writes and reads till five, which is the dinner hour. After dinner he walks in fields and meadows till sunset, and ends the day by a game at billiards or some similar amusement. But all this is changed when the spirit

moves him to create. Then the Erard piano, which is sometimes unopened for years together, has to be tuned, and for hours at a time the instrument resounds under the hands of the composer.

THE MUSICAL MERCHANT AND HIS DAUGHTER.

Verdi's bedroom in the basement of the villa is a large apartment in which the furniture is arranged so as to form a screen and divide the room in two. One half thus serves as a study. It is decorated with many valuable souvenirs, the favourite, perhaps, being the oil painting which represents Antonio Barezzi, the dealer in drugs, etc., at Busseto, and Verdi's only patron. The name of Barezzi will always be honoured in the history of Italian music, and Verdi's becoming an apprentice in his house was one of those happy accidents which show that behind the herring-barrels and sugar bags fate was on the watch for genius. Barezzi was not only a flautist in the cathedral, but he could play the clarinet, the French horn, and the ophicleide, and he had some knowledge of other wind instruments. Moreover, he was the president of a philharmonic society which rehearsed in his house, and had for conductor the organist of the church. Here Verdi was happy, and it may be imagined that he was in a sea of delight when Barezzi's Vienna piano by Fritz was placed at his service. Barezzi's daughter, Margherita, was also something of a pianist, and Verdi and she played duets together, the two ending with marriage, but in 1840 Verdi lost his young wife. His second wife, who is still living, was a famous singer in the first Verdi operas.

THE TWO OLD PIANOS.

Besides numerous portraits by modern masters, many old prints and drawings ornament the walls of the villa. There is also a fine library, where everything is beautifully arranged and made accessible to visitors without the vain hand of the owner to guide them; but it is the two old pianos which are the most interesting monuments preserved by the composer. The terrible spinet on which he had his first lessons, and over which he got into such a temper that he was found smashing it to pieces because he could not find a certain chord on it, would have an interesting story to tell could it but make itself intelligible. Meanwhile its restoration after Verdi's passionate outbreak is explained by an extraordinary inscription. It runs somewhat as follows:—

I, Stephen Cavaletti, restored these jacks and covered them with leather, and added pedals; all of which I do gratis in acknowledgment of the good disposition of the boy Giuseppe Verdi to learn to play the instrument, and this alone is enough to reward me for my trouble. A.D. 1821.

The Fritz piano of Barezzi stands by its side.

VERDI AS A POLITICIAN.

Verdi was once persuaded to take up politics and represent a constituency in order to supply the Italian Chamber with some much-needed harmony, as Cavour put it. Later he explained his position:—

I know nothing of politics, but while Cavour was alive, I looked at him and voted as he did, feeling sure that if I only did as he did, I should not do wrong. Now, since Cavour is gone, I don't understand the other gentlemen, and I am afraid of doing something stupid.

In the Chamber he sat by his friend Sella, and while the latter drew mathematical hieroglyphics, the composer amused himself by setting to music some silly phrase or other uttered by some honourable member. Several such Verdi autographs are in the possession of former deputies.

HUMOUR IN THE SCHOOLROOM.

A CANADIAN COMPILATION.

A TORONTO school inspector named J. L. Hughes has put together in the *Canadian Magazine* for July a considerable number of good stories. Some of them are not new, but most of them are well worth printing, for a good story can hardly be told too often. The following samples are culled from his paper:—

OUT OF THE MOUTHS OF BABES AND SUCKLINGS.

"Who made you?" asked a primary teacher. The little girl addressed evidently wished to be accurate in her reply: "God made me so long"—indicating the length of a short baby—"and I grewed the rest."

"Who were the foolish virgins?" brought the prompt answer from a wise little girl—"Them as didn't get married."

"Boys," said a teacher, "can any of you quote a verse from Scripture to prove that it is wrong for a man to have two wives?" He paused, and after a moment a bright boy raised his hand. "Well, Thomas," said the teacher encouragingly. Thomas stood up and said solemnly: "No man can serve two masters." The questioning ended there.

The words "His Satanic Majesty" occurred in a story read in one of the Toronto public schools. "How many know who his Satanic Majesty is?" said the teacher. Several hands were raised, and the first pupil named promptly replied, "The inspector." It is encouraging to know that she was a very young child. History and Scripture were never more thoroughly mixed than by the boy who wrote: "Titus was a Roman Emperor—supposed to have written the Epistle to the Hebrews; his other name was Oates."

SCHOOL BOY SCIENCE.

Here are a few answers culled at random:—

"The food passes through your windpipe to the pores, and thus passes off your body by evaporation through a lot of little holes in the skin called capillaries." "A circle is a round straight line with a hole in the middle." "Things which are equal to each other are equal to anything else." "In Austria the principal occupation is gathering Austrian feathers." "The two most famous volcanoes of Europe are Sodom and Gomorrah." "Climate lasts all the time, and weather only a few days." "Columbus knew the earth was round because he balanced an egg on the table." "Mrs. Browning wrote poetry to the pottery geese." This was not complimentary to the Portuguese nor to the teacher's method of teaching literature. "The blood is putrefied in the lungs by inspired air."

SOCIOLOGY.

A poor boy was asked, "What is a gentleman?" "A fellow that has a watch and chain," he replied, adding, when he saw that his answer was not perfectly satisfactory, "and loves Jesus." "Mediæval is a wicked man who has been tempted." "A demagogue is a vessel containing beer and other liquids." "Tom, use a sentence with responsibility in it." Tom said: "When one suspender button is gone there is a great deal of responsibility on the other one." "What is a lad?" inquired the teacher. A very small girl answered, "A thing for courting with." "Give the future of drink." "Present, he drinks; future, he will be drunk." "The plural for pillow?" "Bolster." "Compare ill." "Ill, worse, dead." This recalls the answer of the boy who said, "Masculine, man; feminine, woman; neuter, corpse."

POLITICS AND PHILOSOPHY.

"Who was the first man?" said a Chicago teacher. "Washington," promptly answered the young American. "No," said the teacher; "Adam was the first man." "Oh, well, I suppose you are right," replied the undaunted patriot, "if you refer to furriers." "How did that blot come on your copy-book, Sam?" "I think it is a tear, Miss Wallace." "How could a tear be black, Sam?" "It must have been a coloured boy who dropped it," suggested the reflective Samuel. "What made the tower of Pisa lean?" "The famine in the land." "Now, children," said the teacher, "we have gone through the

history of England—tell me in whose reign would you live if you could choose for yourself." "In the reign of King James," said philosophic Alec, "because I read that education was very much neglected in his time." "Count twenty when you are angry before you strike," said the teacher. "Please, I think it is better to count forty if you can't lick the other fellow," wisely added the cautious Harold. "Susan, if I were a little girl I would study my lessons," said the teacher reprovingly. "Then I guess you are glad that you ain't a little girl," shrewdly answered Susan. "If you wish to be good-looking when you grow up you should go to bed early," was the advice of a lady teacher to her class in hygiene, Isabel rather rudely ventured to say in reply: "I 'spect you set up late when you was a girl."

A SUGGESTION TO TEACHERS.

Mr. Hughes concludes his paper by the following suggestion, which I commend to the attention of English teachers:—

The humour of the schoolroom is too valuable to be lost. Every teacher should record the humorous answers and the amusing incidents in connection with her class. Teachers Associations should appoint recorders of humour, to whom all teachers should send the merry sketches of their schoolrooms. An hour spent in reading these stories in conventions would be profitably spent. The publication of a volume of such stories periodically would enrich the literature of humour. The best collection of extraordinary answers yet issued is that prepared by Miss Caroline B. Le Row, of Brooklyn, New York.

SOME ENGLISH EXAMPLES.

There is an interesting addendum to this Canadian paper—a few extracts from some samples of the examination papers furnished to a writer in *Macmillan's Magazine* for August, by one of Her Majesty's inspectors. These samples of lack of knowledge have all been culled from the examination papers of young women from nineteen to twenty-one, who wish to obtain certificates as teachers:—

A girl of twenty-one, for instance, who when asked from what different sources Richard the First obtained money for his Crusade, made answer to this effect: "Richard the First surnamed Cour de Lion, meaning Lion-Hearted, was a very powerful king. He obtained money in various ways for his Crusades who travelled a great deal." From the same quarter came the following lucid explanation of the particular cause which rendered Wicliff's teaching popular: "Wicliff's teaching became very well known, and was thought a great deal of, and no doubt it came in very useful and the people were very glad of it."

But this is lucidity itself compared with the explanation given by one of the candidates of the main principles of Wolsey's foreign and domestic policy: "The main principle of Cardinal Wolsey's foreign policy were the manners in which he attacked his enemies. In the siege of Quebec he ascended the mountains at dead of night, when his enemies were at rest and took the town at daybreak. His home policy was conducted in a similar manner." Another wrote, "Wolsey was found out by Henry, and charged with high treason for breaching against the Act of Premunire." But Hampden seems to have been as sore a puzzle as Wicliff or Wolsey. (1) He was one of the Pilgrim Fathers. (2) He was a blacksmith who killed a tax-collector for insulting his daughter. (3) He figured very prominently in the reign of James the First. He refused to pay ship-money and was tried by twelve bishops. He held fast to his own rights, and though he suffered the extreme penalty, he convinced the people that James was exacting too large a sum to enrich his own person. One candidate considered the chief battles of the Civil War to have been "St. Albans, Edgehill, Bunker's Hill, and Camperdown." Another wrote, "Both the Royalist and Parliamentarian parties in the Civil War suffered from internal dissension because, their baggage being all swept away, they were pierced with cold and hunger."

HOW FRENCH CONVICTS LIVE.

A VISIT TO NEW CALEDONIA.

In the *Revue des Deux Mondes* of July 15th M. Paul Mimande contributes a second article on the French penal colony of Nouméa, which is even more interesting than his first. After a few pages of general reflection on the capabilities of the penitent thief, and the danger of treating him too leniently, the author describes his visit to a Nouméa printing office, where he gave an order for visiting cards to a well-dressed gentleman of some fifty years of age, who, with an eyeglass perched upon his nose, was busily writing "copy." The next day, when passing a café he saw this same individual drinking a cocktail. In answer to an amiable smile of recognition, M. Mimande raised his hat. "What on earth are you doing," said the official with whom he was walking; "don't you know that we never return the salute of a ticket-of-leave man!" and it turned out that the man with the eyeglass was a fraudulent clerk whose sentence of ten years' hard labour had just expired!

A PARADISE OF CONVICTS.

The pith of the article is found in a description of Bourail, a small town entirely peopled by convicts, who have gone through the various stages of punishment. Here they are allowed to wear the ordinary French blue blouse, their hair long, and a beard. Bourail dates from 1869, and is the second largest town on the Island; it lies in a valley, and the houses cluster round the church spire much as they would in any little old town in far-away France. Situated about ten miles from the sea and on good land, it contains seven hundred families, a population of 1,600 souls, and the traveller as he comes down from the hills above the town would find it difficult to realise that this is a penal settlement, for as he walks along the pleasant road which leads him into the valley he meets carts drawn by oxen, prosperous-looking labourers in blouses, and hearty strong-looking women, sitting Amazon fashion astride upon their horses, with whips in their hands. A pretty house displays the tricolour flag, and the traveller is soon informed that there resides the Commandant. It is from this important official that permission to visit Bourail must first be sought before any stranger is allowed to put up at the Hôtel de France, a comfortable hostelry kept by the widow of a convict, and where, of course, both the cook and waiters are ticket-of-leave-men.

ITS CAPITAL AND ITS CITIZENS.

There is only one main thoroughfare, "But what a street it is!" exclaims M. Mimande; the saddler, who boasts that he once worked for Victor Emmanuel, is an Italian coiner caught and condemned at the Versailles assizes. One of his daughters had made a romantic marriage to a young government clerk, who for love of his wife procured his own transfer to an appointment in New Caledonia. His other daughter is married to a man who is working out his time: "an eclectic father-in-law," observes the traveller. A little further up the street is a hair-dresser who could once boast of a shop on the Boulevard; he has now to content himself with shaving the functionaries of Bourail. The local newspaper office is in the same house, and the editor's misfortunes have not destroyed his powers of political satire. His paper rejoices in the name of the *Bourail Independent*. The shabby little grocer's shop is kept by an unfrocked priest; the circulating library and stationer's shop belongs to a one time notary, who has a shaven face, and is precise and dignified in manner. He is a widower, for he murdered his wife. The restaurant is kept by a Chinese

who can talk excellent Marseillaise. He has not much to be ashamed of, for he is only in trouble for rebellion. There is a hospital wherein inhabitants of Bourail can procure gratuitous advice and treatment. M. Mimande evidently seems to think that the medical arrangements of the settlement are those which are in real need of reform. The hospital is badly built, and the two government doctors are overworked, being incessantly on horseback visiting out-stations. As for the Bourail police, they have practically nothing to do, and spend their time in catching parrots and green pigeons. The primary schools are managed by a religious order, probably Christian brothers, and the children of the Commandant sit on the same benches as those of the convicts during school hours.

NUNS AS MATCHMAKERS.

M. Mimande gives a curious description of the women's quarter, which is managed by nuns. The lady superior is an alert old woman whose kind eyes are not devoid of satire. She observed to M. Mimande, "I used to think I knew all about the wickedness of the world, but I find I was mistaken." There is a curious system by which ticket-of-leave men farming the land round Bourail are allowed to seek for wives, the nuns acting as go-betweens. Strange to say these unions are said to succeed better than those when the innocent wife has come from France with her children to rejoin her convict husband.

The children born in the colony give very little trouble, but a good school is very much wanted for the girls. It is to be noted that the commercial success of the small farmer-concessionaries round Bourail is quite extraordinary. The thrift, untiring industry, fertile intelligence, and resource of the French peasantry are equally remarkable under these new conditions in the far Australian seas. Perpetual hope springs in the hearts of the most degraded Frenchmen when married to the fertile earth, for to him "distance cannot wither her, nor custom stale her infinite variety."

The Australian Girl.

JULIA NICHOLSON has a brief paper in the *North American Review* for July upon Australian women, which is well written. Its note is that the Australian girl is very precocious:—

Before the English girl has outgrown childish delights the Australian is a woman in miniature, self-conscious, self-confident, not easily abashed, with eyes that long since have ceased to look out upon the world with wonder. In a short skirt, with a plait down its back, young Australia imitates its elders, flirts, falls in love, and, sometimes, reads and writes funny little love-letters in all seriousness. Very youthful, very innocent all this in its way, but the way itself strikes one as just a little precocious. Like her brother, the Australian girl has a say as to what she learns, where [she goes, what she wears. In fact, she brings herself up under easy supervision. Grown to womanhood, the glitter and glamor of life already tarnished in her sight, she is without reserve, possessed of few illusions and less sentiment. She has arrived at a very good opinion of herself.

The Australian wife is uninteresting, her life narrows down, she seldom shares her husband's interests, and is full of worrying household cares. The Australian woman is not graceful, does not dress well; she is either overdressed or dowdy, and has no artistic sense of the fitness of things. Her feet are seldom small, her hands are rarely beautiful; yet she is pretty, tall, and well-formed. She is vain and somewhat indolent, the serious side of life scarcely appeals to her, and she exacts neither obedience nor reverence from her children.

A CONTEMPORARY OF ST. PAUL'S.

THE STORY OF THECLA.

In the *Church Quarterly Review* for July there was a long article devoted to Professor Ramsay's "The Church and Roman Empire before A.D. 170." The most interesting part of the review is that in which the account is given of Professor Ramsay's attempt to find the nucleus at least of a contemporary story illustrative of St. Paul's life and preaching in Asia Minor. This story he has found in the Acts of Paul and Thecla. The nucleus, Professor Ramsay thinks, dates as far back as the first century, and he has made an attempt to disentangle the original matter from the subsequent recasts. The result of his efforts is thus summed up by the reviewer:—

A DESCRIPTION OF THE APOSTLE.

After leaving Antioch (of Pisidia) on his first missionary journey (Acts xiii. 51), St. Paul took the "Royal Road that leads to Lystra"—the new military road built by Augustus to connect his colonies—until he came to the place where the branch route to Iconium diverges. At this point he was met by an inhabitant of the latter city, who recognised the Apostle from the description which had been given of his personal appearance—"a man of small stature, bald-headed, somewhat bow-legged, with meeting eyebrows and a rather long nose, full of grace, at one time like a man, at another like an angel." Together they went on to Iconium, and there, in the house of his host (Onesiphorus is the name supplied by the reviser), "there was great joy, and bending of knees, and breaking of bread, and God's word concerning temperance and resurrection."

THECLA'S CONVERSION.

The sermon was overheard by Thecla, the daughter of Theoclesia, and affianced bride of Thamyris, as she sat at the window of her mother's house close by. Night and day she continued to listen, clinging to her place "like a spider" to its web, though she could only catch the words and could not see the speaker. Neither her mother nor the women servants, nor her betrothed, could move her. In despair Thamyris appeals to the magistrate against Paul for corrupting the city and interfering between man and woman, and the Apostle is thereupon thrown into prison. But Thecla, the same night, by bribing the porter of her mother's house with her bracelets to let her out, and the jailer of the prison with a silver mirror to let her in, succeeded in penetrating to Paul, and listened again to his preaching of "the great things of God."

THECLA'S SENTENCE.

In the morning, when her proceedings were discovered, both Thecla and Paul were brought before the magistrate. The Apostle was scourged and expelled from the city, the lady was questioned why she did not obey her betrothed according to the law of the Iconians, and probably (as the account in Pseudo-Chrysostom implies) was then handed over to her relatives to be dealt with. Thecla appears to be still searching for Paul, when, at the entrance to Antioch, Alexander, one of the chief men of the place, on seeing her, became enamoured of her, and attempted to force himself upon her notice. She resisted, proclaiming herself a stranger, a noble lady of Iconium, and God's handmaiden, and in the struggle the crown upon his head, adorned with figures (or as some of the Syriac MSS. better have it, "with the figure of Cæsar") fell to the ground. As he was exhibiting games to the people, it is obvious that he had an official position, possibly even that of high priest of the worship of Augustus, and the assault was revenged on Thecla by a sentence of exposure to the beasts which thus happened to be at hand, a severity resented by the women among the bystanders, who cried out, "Ill judgment, unholy judgment." Thecla only claimed to preserve her purity until her martyrdom, and was in consequence entrusted to the charge of a lady of royal rank, Queen Tryphæna, who received her in place of a lost daughter. From the time of Caligula's accession in A.D. 37,

Tryphæna ruled over Pontus jointly with her son, and the bodies of both of them appear on the coins.

AN ABORTIVE MARTYRDOM.

In the account of the martyrdom itself, the historical and the legendary are difficult to disentangle. A lioness is the cause of Thecla's immunity from the death to which she has been sentenced, by refusing to touch her itself or to permit other beasts to do so, and Thecla, who is yet unbaptized, seeing a tank full of water, leaps in with the cry, "Lo, now time to wash myself: in the name of Jesus Christ for the day (or on the last day) I am baptized." Anyhow, when more than usually barbarous proposal was made by Alexander to tie Thecla to two savage bulls, and assented to by the magistrate, Queen Tryphæna fainted away, and was for a moment believed to be dead. In the reaction of horror at result and fear for the consequences—for Tryphæna, as we have seen, was Cæsar's relative—Alexander implored, and the magistrate willingly conceded, Thecla's release. Whether the original story left her at Antioch in the household of Queen Tryphæna, as Professor Ramsay apparently thinks, not easy to say; all extant forms of the Acts take her first to Myra to rejoin Paul, then back to her home at Iconium, lastly, across the hills again to Seleuceia, where also Latin and Syriac versions place her death.

THE POSITION OF WOMEN IN ASIA MINOR.

Professor Ramsay, if we understand him rightly, is of opinion that the Acts, thus purged of later growths, are a genuine contemporary record of the experiences of a disciple of St. Paul, and even those to whom this seems at first sight a conclusion too startling for acceptance cannot well decline, on evidence, to admit at least a first century origin. Were facts not to be literally true, they would yet be typical of the surroundings, and expressive of the thoughts, of the generation to which St. Paul preached, and throw a welcome light on the social conditions of the country in the first century after Christ. The prominence of women impressed deeply on the early history of Asia Minor. To trace this through the mother was no uncommon thing. Arrian remarks that while elsewhere men ruled over women, in Asia Minor women ruled over men. Nor was the phenomenon confined to heathenism; the Jewish women are specially mentioned in the Acts of St. Pionius, and Professor Ramsay has called attention to the unique appointment of a woman to be *archisynagoga* at Smyrna. At Antioch of Pisidia the women proselytes of the rank are the chief class through whose means the Jews were expelled from the city. Instances of the daughters of Philip, of the Montanist priestesses Prisca and Maximilla, or of the prophetess of Firmilian of Cæsarea tell us that she baptized and consecrated the Eucharist, prove that in quasi-Christian, and even Christian, circles the sex had attained something of a high and unusual rank. It ought, therefore, to be no matter of surprise to find the same feature in the story of Thecla. "Many women" were among those who attended St. Paul preaching in the house of Onesiphorus, just as the chief of the whole city brought against him was that "he corrupted all our wives." In the prayer of Thecla, as she stood naked in the arena at Antioch, she speaks of the "sal of women uncovered in her"; and on the same occasion sympathy of the women in the crowd is more than emphasised—expressed at first in wailing words, then in casting perfumes on the martyr.

MRS. GRUNDY RATHER THAN TORQUEMADA.

The reviewer points out that Thecla was condemned to die, not as a Christian, but on account of two charges held to be proved against her. The first was one of sacrilege, in that she had resisted an attempt to marry her made by one who bore for the moment a sacred character; the other charge was that of interfering with the traditions of society, and upsetting the custom of family life. Mrs. Grundy had more to do probably than the first persecution of the early Christians than to fervent faith in the truths of paganism.

THE REVIEWS REVIEWED.

THE NINETEENTH CENTURY.

I NOTICE elsewhere the two papers by Mr. Curzon and Mr. Boulger on the "Crisis in Indo-China," also Lord Meath's "Plea for Public Playgrounds for the Children." The other articles are readable, but do not call specially for notice.

HOW TO HELP THE SEAMSTRESS.

Mr. W. H. Wilkins, in an article entitled "How long, O Lord, how long?" says that when, fifty years ago, Tom Hood wrote his "Song of the Shirt," the seamstress earned 2½d. an hour; to-day most of them cannot average more than 1½d. per hour. He says, truly enough, that—

Until something has been done to place the price of these poor women's labour upon a fair level we cannot hope that they will be able by honest toil to lead virtuous and self-respecting lives.

But how to solve this difficulty is the question. He is in favour of more factory inspectors, and a vigorous attempt to establish a Union among these wretched unfortunates. He says:—

What is rather wanted at the present time is that the Factory Act as it stands shall be thoroughly carried out, and its provisions with regard to women-workers rigidly insisted upon. When that is done it will be time to talk about amending it.

The first thing necessary is to largely increase the number of inspectors, and to appoint women factory inspectors—not in this industry only, but in all industries in which women-workers are employed. None but a woman can know a woman's weakness; none but a woman can know a woman's need. What is, therefore, wanted is that a committee should be formed of men and women who are interested in this question, and so form the nucleus of an organization to protect those who are at present unable to protect themselves. In connection with such a movement there might also be a Benefit Society, which would be useful in cases of sickness or distress; and co-operative works might be started, bringing the producer nearer the customer, and so do away with sweaters and middlemen.

THE ESTIMATE OF THE NEGRO.

Bishop Fitzgerald, replying indignantly to Lord Meath's indictment of the Southern whites for their treatment of the Negro, states what could be said on his own behalf vigorously enough, and, then, towards the close of his paper, sounds the following very uncertain note upon the passage:—

What of the negro's future? He has faith, music, and eloquence. I have never known a negro who was an infidel. I have known thousands who believed too much, but not one who believed too little. Almost every negro is a natural musician. The average negro is more eloquent than the average white man of equal intelligence. Taking the best of the negro race, one could hope for almost anything in their future. Taking the worst, we might well despair of anything. Sweeping generalisations in either direction are deceptive. Negroes differ from one another, as white men differ from one another. As a whole, God has made no kinder race.

THE FUTURE OF EDUCATION.

Professor Mahaffy discusses this subject in a long paper, towards the close of which he thus expresses what he regards as the sum of the whole matter:—

Let us distinguish clearly between technical and liberal instruction, even in the highest forms. To begin with a combination of both at our public schools is perfectly wrong. If they really aim at a liberal education, let that be attended to,

and upon the old and well-established principles which have furnished us with cultivated men for many centuries. To allow young boys, or incompetent parents, to select the topics which they fancy useful or entertaining is an absurdity. On the other hand, every effort should be made to have higher technical schools, not only efficient, but so managed that lads will learn good manners there, and may not be stamped with inferiority from a social point of view. To make mere technical education as refining as the other is no doubt impossible, but every effort should, nevertheless, be used to let those whose lives compel them to accept this narrower course still feel the truth of the old adage that "manners maketh man."

EVOLUTION IN PROFESSOR HUXLEY.

Professor St. George Mivart rejoices with exceeding great joy upon the progress which Professor Huxley has made towards what his critic regards as the true faith. He hardly dares to hope, however, that he is right in regarding Mr. Huxley's utterances as a decisive declaration in favour of the essentially distinct nature of man. Professor Mivart thus describes his own position:—

For my own part my conviction grows ever stronger that, though corporeally man is but a sort of ape, his intellectual nature is so distinct that, thus considered, there is more difference between him and the orang than between the latter and the ground beneath its feet.

But high as he is raised above the rest of Nature, the very limitations of his reason, considered in the light of the highest ethical aspirations of his being, demand something beyond Nature—a Divine Revelation.

This is what the higher races of mankind seem to me to have, consciously or unconsciously, sought and striven for, from the dawn of history till the advent of Christianity. The acceptance of that revelation (of course without the surrender of a single truth of physical, biological, historical, or any other science) is, I believe, the logical outcome of the Theistic corollary implied by that power of ethical intuition which so forcibly proclaims both the responsibilities and the dignity of man.

OTHER ARTICLES.

Lady C. Milnes Gaskell writes brightly and slightly upon her recent sojourn in the Highlands. Dr. Jessopp contributes an admirable short story entitled "An Incident in the Career of the Rev. Luke Tremain," a muscular Christian, who would have delighted the heart of Charles Kingsley. Prince Krapotkin discourses upon "Recent Science" in an article which it is in vain to try to summarise. Mr. William Gibson writes on the "Abbé Grégoire," who declared his faith in Christ in the midst of the National Convention at the time of the French Revolution. Mr. Worsfold descants on the poetry of Dante Gabriel Rossetti, Professor Max-Müller replies to Mr. Sinnett on the subject of "Esoteric Buddhism," and "Wyvern" writes knowingly on the "Art of Household Management."

Women as Volunteers.

I AM glad to see the suggestion that women should form Volunteer Corps of their own has met with some considerable degree of interest, and, what is still more valuable, has been freely discussed in the press. As a well-known lady, who writes under the name of "Desperando," says, "Regular drill and discipline will do women physically a great deal of good, and it is much better that women should learn that it is womanly to know how to handle a sword and fire a gun, instead of being taught to think that true womanliness consists in screaming or fainting at the sight of one."

THE CONTEMPORARY REVIEW.

THE August number is very solid, without any article that calls very particularly for lengthy notice.

THE ETHICS OF THE STRUGGLE FOR EXISTENCE.

Mr. Leslie Stephen discusses the question raised by Professor Huxley's famous Romanes lecture at Oxford on the combat between the ethical and cosmic nature. Mr. Stephen thinks that some more has to be said, and so he writes about a dozen pages, leading up to the following conclusions:—

I hold, then, that the "struggle for existence" belongs to an underlying order of facts to which moral epithets cannot be properly applied. It denotes a condition of which the moralist has to take account, and to which morality has to be adapted, but which, just because it is a "cosmic process," cannot be altered, however much we may alter the conduct which it dictates. Under all conceivable circumstances, the race has to adapt itself to the environment, and that necessarily implies a conflict as well as an alliance. The preservation of the fittest, which is surely a good thing, is merely another aspect of the dying out of the unfit, which is hardly a bad thing. The feast which Nature spreads before us, according to Malthus' metaphor, is only sufficient for a limited number of guests, and the one question is how to select them. The use of morality is to humanise the struggle; to minimise the suffering of those who lose the game; and to offer the prizes to the qualities which are advantageous to all rather than to those which serve to intensify the bitterness of the conflict. The more moral the race, the more harmonious and the better organised, the better it is fitted for holding its own. But if this be admitted, we must also admit that the change is not that it has ceased to struggle, but that it struggles by different means. It holds its own not merely by brute force, but by justice, humanity, and intelligence, while it may be added, the possession of such qualities does not weaken the brute force, where such a quality is still required.

THE RITUALIST'S REPLY TO ARCHDEACON FARRAR.

Canon Knox Little replies to Archdeacon Farrar's denunciation of the Romanising party in the Establishment by defending almost everything that Archdeacon Farrar attacked. In particular, he defends the use of confession, and pleads that the best way to maintain a steady and increasing enthusiasm for the Church is not controversial bitterness, but generous considerateness, large allowances for our diversity of views, and Christian love:—

From "none of any manliness and intelligence" adopting the "abject thralldom" of confession and absolution, some of the noblest men I have ever known, in every rank from the highest to the lowest, and with intelligence, uprightness, and manliness not inferior to the Archdeacon himself, have found and find in the use of confession and absolution—as taught and sanctioned by the Church of England—gifts of supernatural grace, powers to fight against the encroachments of sin and a greater nearness to the tenderness and strength of Christ.

SCOTCH DISESTABLISHMENT.

The Rev. Donald Macleod states the case against Disestablishment as strongly as he can. He begins by stating facts concerning the past and present of the Church, and then describes its comparative strength in relation to other Churches, making out that the Establishment has a majority over all other communicants and all other Protestants in Scotland. If so, and if he is right in saying that the Episcopalian and Roman Catholics, and the Original Seceders among the Presbyterians are opposed to Disestablishment, how does it come to pass that Scotch Disestablishment is within sight? He replies that it would not be in sight if Scotland could be polled upon the Church question alone.

It would seem that Dr. Macleod is rather disgusted with Mr. Gladstone for, in the foot-note, he says, "There are few greater curiosities in recent political literature than the statements and re-statements, and subsequent denials of them all, made by Mr. Gladstone."

THE NEW ISLAM.

Mr. Edward Sell devotes a paper to what he calls "The New Islam," which is a very earnest attempt on the part of some of the most distinguished and cultured of Indian Mussulmans to bring Islam into accord with the progressive tendencies of the nineteenth century. It is curious to know that the liberal spirit of Islam depends very largely upon the placing of a comma or a full stop. In the Koran it is said that, "None knoweth its interpretation but God;" then follows a full stop; the next line goes on, "And the stable in knowledge, say, we believe it, It is all from our Lord." The liberal theologians maintain that this ought to read, "None knoweth its interpretation but God and the stable in knowledge," putting a full stop after knowledge, from which it would follow that men of intelligence can understand questions which it is commonly supposed that none but God could fathom.

In the eyes of the New School, the Mohammedan common law, or Shariat, is no longer to be considered a sacred law incapable of change. A prophet is no longer to be immaculate or infallible. The new reformers explain away the texts justifying polygamy, concubinage, and slavery. In the law they maintain the possibility of changing the law of Islam when new conditions require new developments, and the teaching of the Koran on moral questions is held to be a mere temporary measure.

THE EVOLUTION OF LIBERAL UNIONISM.

Sir George Osborne Morgan is not a particularly brilliant writer, and it is with some sense of weariness that we turn to the discourse under that above heading. He has not much more to say than that Liberal Unionists are gravitating more and more to the Conservatives, and the only bright point in his paper is his remark that stranger things have happened in England than the appearance of Mr. Chamberlain in the rôle of a Conservative Prime Minister, and, possibly, in that of Earl of Birmingham and a Knight of the Garter.

OTHER ARTICLES.

Mr. George Barlow, in his paper on "French Plays and English Audiences," writes from the point of view of one who admires the French players almost as much as he despises the English people who go to hear them. Madame Darmesteter has a brightly written sketch of "Spring in the Woods of Valois." Mr. J. Rendel Harris replies to Dr. Martineau in order to prove—which he does to his own satisfaction—that there are certain features in the literary structure of the Gospel of Peter which stamp it indelibly as an artificial and late product. Mr. T. W. Rolleston has a very solid article upon the influence of Lessing on German literature, for German literature, at least at the present time, needs more than anything else the appearance of another Lessing. Mr. Walter Besant publishes, under the title of "The Associated Life," his presidential speech at the opening of Hoxton Library. Mr. Besant says, "When, in the history of any city, has there been found such a combination, so resolute for culture, as the combination of men and women which has raised this temple, this sacred Temple of Humanity,"—which is putting it rather high for a Hoxton library institute. Mr. Stuart Henry has an article entitled "The Gray and Gay Race," and indulges in a few pages in a pleasant little dissertation as to the identity there is between grayness and gayness.

THE FORTNIGHTLY REVIEW.

A GOOD all round number is this, with one or two articles everyone will read. I notice elsewhere Admiral Hornby's paper on "The Loss of the *Victoria*," Mr. Pearson's "Answer to some Critics," Professor James Long's programme for the salvation of the British farmer, and the Rev. Samuel Barnett's eulogy of Japan.

THE NEEDS OF THE NAVY.

Admiral Sir Thomas Symonds has for many long years been one of the most persistent of all those who have agitated for a stronger navy. He has, however, somewhat spoilt his case by exaggerations, of which this new article bears considerable traces. Nothing pleases him in our navy, and he demands immediately six rams of six thousand tons displacement. He concludes his article with the following declaration:—

The Naval Defence scheme supposes our navy to be as strong as those of the two strongest naval Powers combined, whereas we are dangerously inferior to France by itself; and we have literally and truly no reserve of ships or men.

THE WANDERINGS OF THE NORTH POLE.

This is the title of one of Sir Robert Ball's interesting astronomical articles. It will be news to most people not astronomers that the North Pole moves. But it would appear, from the observations of Professor Chandler, that it does move within a small circuit. So exact is astronomical science at the present day that the movement of the Pole, which has never been approached within four hundred miles, can be accurately observed, even if it only moves thirty feet in any direction. The following passage summarises the result of Prof. Chandler's observations:—

In that palaeocystic ocean which Arctic travellers have described, where the masses of ice lie heaped together in the wildest confusion, lies this point which is the object of so much speculation. Let us think of this tract, or a portion of it, to be levelled to a plain, and at a particular centre let a circle be drawn the radius of which is about thirty feet; it is in the circumference of this circle that the Pole of the earth is constantly to be found. In fact, if at different times, month after month and year after year, the position of the Pole was ascertained as the extremity of that tube from which an eye placed at the centre of the earth would be able to see the Pole of the heavens, and if the successive positions of this Pole were marked by pegs driven into the ground; then the several positions in which the Pole would be found must necessarily trace out the circumference of the circle that has been thus described. The period in which each revolution of the Pole around the circle takes place is about 427 days; the result, therefore, of these investigations shows, when the observations are accurate, that the North Pole of the earth is not, as has been so long supposed, a fixed point, but that it revolves around in the earth, accomplishing each revolution in about two months more than the period that the earth requires for the performance of each revolution around the sun.

THE LIMITS OF ANIMAL INTELLIGENCE.

Professor Lloyd Morgan's paper under this title describes an interesting series of experiments conducted by him on very young chickens for the purpose of ascertaining whether they learned to eat and drink by experience or by intuition. He decides in favour of experience. He then proceeds to discuss what animals know and what they don't know. He says:—

As the animal has, in my view, no power of judging actions in relation to a standard of right, no power of appraising objects in relation to a standard of beauty, so also it has, I conceive, no power of gauging its perceptions and conceptions in relation to a standard of truth. For truth is a matter of intellectual knowledge, and such knowledge the brutes have not. It lies beyond the limits of animal intelligence.

He also thinks it probable that they are incapable of moral judgment. They have intelligence, but reason fails them; reason as he defines it adapts conduct from a clear perception of the relationships involved. Animals act by experience, association, imitation, which are the main factors of intelligence, not by explanation and intentional adaptation, which are the goal of reason.

THOMAS PAINE.

Mr. Leslie Stephen has an essay upon this much-abused man, to whose character and career he pays tribute not undeserved. Paine was the son of a poor Quaker in Thetford, and he was all his life Quaker, minus the orthodox creed, substituting a metaphysical dogmatism for the inner light. He was an idealist endowed with a strong vein of vigorous common sense. Mr. Stephen says he cannot take Paine seriously as a philosopher, but he thinks that those who share his views may fairly take a pride in some qualities of their champion's. His chief achievement was his clear distinctive unveiling of the hitherto masked conviction of the masses of his contemporaries.

OTHER ARTICLES.

Mr. Gundry, in a well-informed article, describes the causes which lead the Chinese to resent the presence of missionaries in China. It is not very surprising that the missionaries should have difficulties in a country where thirty-seven portions of the human body are named in the best work in Chinese *Materia Medica* as valuable contributions to the pharmacopœia.

Mr. W. H. Hudson explains the use which the serpent makes of its tongue in fascinating its victims. Mr. Archer writing on "Plays and Acting of the Season," confines himself to vindicating "The Second Mrs. Tanqueray" from the criticisms of Mr. George Moore, and to a notice of the *Comédie Française*.

Longman's.

THERE is an interesting paper "On Leopards," by C. T. Buckland, in *Longman's Magazine*. Austin Dobson describes the "Topography of Humphrey Clinker." Mr. Dobson thinks that Mr. Smollett wrote the book largely for the purpose of reviving his impressions of the visits which he had paid to Bath, London, and the north of England. Mr. Andrew Lang writes pretty smartly on Mr. Ernest Hart's presumption in denouncing all research into psychical and occult phenomena, excepting those conducted by Mr. Ernest Hart.

The Westminster Review.

MR. FRASER RAE has a very excellent paper on the "Colony of Gibraltar" in the *Westminster Review*. It is a reply to Mr. Laird Clowes and Captain Gambier, who regard the famous old rock as worse than useless to Great Britain. Mr. Rae roundly combats their contention on almost every ground, maintaining that the rock was never more defensible than now, and the idea that it could be rendered untenable by a few Spanish batteries is ridiculed. His chief point is that in Gibraltar we have 20,000 colonists who wish to remain British, and who would bitterly resent any proposal to hand them over to Spain. Other interesting articles are the account which is given of "Home Rule in Operation," and the Channel Islands, which is written by Mr. H. G. Keene, and contains within a comparatively short compass nearly everything that one wants to know of the Channel Islands. Another important article is Mr. J. Castell Hopkins's Paper on "Canada and the Pacific Canadian Railway." The other notable articles are one on "Burial Customs," and Mr. F. W. Grey on "American Popular Government."

THE NATIONAL REVIEW.

THE *National Review*, I am glad to say, has at last followed the example of the *REVIEW OF REVIEWS*, and publishes this month a chronicle like our "Progress of the World," under the title of "Episodes of the Month." The first place is given to a poem on the "Old and New Idealist," by the late Earl Lytton.

HANG HIM!

Mr. Frederick Greenwood, in an article called "Personal Gratification Bill," develops his favourite thesis that England is going to be ruined because people will not be rude to Mr. Gladstone. He recalls with affectionate admiration the country gentleman whom he knew in the days of his youth, who—

when the name of the great opponent of his Party was mentioned, exclaimed, "Hang him! Hang him, I say!" in a tone which instantly brought before the mind's eye a rope and an overhanging bough.

The present position of affairs in England leads Mr. Greenwood to recall with grateful admiration the succinct and simple method advocated by his country squire, and so he has written an article called "The Personal Gratification Bill," which is the literary expansion of that pious utterance. Mr. Gladstone, he declares, is deliberately endeavouring to humiliate England from an excess of injured vanity, and from a desire to wreak vindictive vengeance upon the country which dared to slight him.

Even the readers of the *National Review* will probably shrug their shoulders, and say that Mr. Greenwood is going a little too far, but Mr. Greenwood probably stands amazed at his own moderation. He says that there is nothing impossible in the suggestion that England may produce a criminal statesman:—

The mildest historians still declare in so many words that there have been men in high position who played the part of tyrant, hypocrite, deceiver, madman, traitor; and, in fact, that in one country or another almost every century has been illustrated by some distinguished personage of this kind.

But Mr. Greenwood cannot wait for the historian. If England is to be saved, the laws of courtesy must be trampled under foot:—

Nothing will go well with us again till we have found sense enough to fling off some at least of the illusions which the prophets of Advancement have imposed on us, and courage enough to deny that tergiversations, mendacities, treacheries, have any right to shelter themselves under forms of courtesy.

SUDERMANN, THE BERLIN PESSIMIST.

Miss Braddon gives a very interesting account of the Berlin playwright whose pessimist dramas have no little vogue in Berlin. Miss Braddon says:—

There is nothing farcical about Sudermann. He is pure *fin de siècle* in his pessimism, and in his willingness to grapple with some of the ugliest problems in social life; but his method is nearer the school of Sardou and Dumas than the stern simplicity of Ibsen. Nor has he the Norwegian playwright's love of the eccentric and the uncanny. He has given us no incarnation of life-weariness and disappointment, like Hedda, no impish death-bringing syren like Hilda. The uncanny, the semi-supernatural, the morbid, and the mystic are as yet untouched by him. His meaning is as crystal-clear as Pinero's; his style as natural; but the scope and construction of his plays are after the Gallic manner, with an added poignancy, a bitter flavour that has more of stern reality than is to be found in the comedies of Augier, Sardou, or Dumas.

PROFESSOR DE TOCQUEVILLE.

Professor Dicey publishes a study of "Alexis de Tocqueville." He says that he can best be compared

with Mr. Bagehot among English writers. He sums him up as follows:—

Tocqueville was in one sense the advocate of democracy: he bid statesmen accept it as a providential fact. But he was at bottom a scion of the old *magistrature* of France; he was the last of the aristocratic writers; and this, though it may for a time deprive him of one kind of popularity, is a literary virtue. With him fine thoughts are expressed in the best language; the style, no less than the profundity, of his reflections will make them live; he will always remain the writer who, with more success than any other man of his time, has known how to investigate, with perfect sincerity, what are the motives which have governed the actions both of himself and of his neighbours, and, having understood them, to explain them to others.

GUY DE MAUPASSANT.

Mr. George Saintsbury publishes an essay upon this writer, who has come to so untimely an end. He says:—

He is, I fear it must be allowed by all competent criticism which looks before and after, the Helot of Materialism, of Impressionism, of Naturalism, of most of the 'isms of this present day. But in recompense he is probably the greatest writer of the last quarter of the nineteenth century in France; for if a greater is coming, he must make haste to appear, and must bestir himself lustily in the seven years that remain. In verse he has shown the dawn, and in prose the noon-day, of a combination of veracity and vigour, of succinctness and strength, which no Frenchman who has made his *début* since 1870 can pretend to equal.

THE NEW REVIEW.

THE *New Review* is a fairly good number. I notice articles on the "Future of the English Drama," "What Can the Government do for the Poor at Once?" elsewhere.

THE BRAIN OF WOMAN.

Professor Buchner has an article on this subject based on the scientific researches of Huschke and others, whose conclusions he summarises as follows:—

The character of the masculine disposition is shown in the frontal bone, that of the feminine in the crown bones, and the woman whose physical character is a continuation of the child-like has remained a child in respect to her brain also, though more exceptions to the rule occur than in the case of the ordinary child, and though the difference between the crown and frontal bones is not marked in the same degree. This scientific result is therefore in accord with the view held for so many thousand years, that the woman is designed more for the life of the heart and of the emotions than for that of the mind and the higher intellectual activities.

Quoting a number of authorities, Professor Buchner comes to the conclusion that a woman's brain is about one-tenth less in weight than a man's brain, and the curious thing is that the higher the culture of the race, the more does the male brain outweigh the female brain. As a rule, every civilised man has got a good size coffee-cupful of brain more than a woman, and what is more, the professor's authorities maintain that the brain of the female adult remains more or less in an embryotic and childish stage. If, however, the weight of the brain is considered in reference to the weight of the body, the disadvantage of woman disappears. That is to say, a woman has more brain in proportion to her flesh and bone than a man.

SAINT IZAAK OF THE ANGLERS.

Mr. Richard Le Gallienne reminds us that—

In a few days it will be three hundred years since Izaak Walton was born at Stafford, and the day, August 9th, is to be fitly kept *piscatoribus sacrum*.

And he discourses enthusiastically on the patron saint of all anglers. He says:—

He was entirely the product of the old order. We see in him an exquisite example of that perfection of character which that old order not infrequently developed. He is perhaps more the ideal Churchman than the ideal Christian, a respecter of castes and an unquestioning supporter of the powers that be. He is the type of man who grows obediently as he is trained, and gives God the glory. It is inevitable that such a type has its limitations.

WILL ENGLAND BECOME ROMAN CATHOLIC?

The most interesting article is probably that in which a writer signing himself "Gallio" answers in the affirmative this question. He says:—

Presuming that a large portion of the English people will want in the future a working form of religion, they will have these two alternatives before them—first, a well-fed, State-endowed Church, whose official bread is well buttered on both sides, whose present constitution is the result of a royal sixteenth-century divorce suit and a seventeenth-century compromise; secondly, an iron-framed organisation based on the assumption of unquestionable authority, armed (if that be granted) with unassailable logic, and accoutred with every device that skill and experience can invent to captivate the human mind and charm the human senses.

The irresistible conviction one is led to in considering the future of religious England is that the unthinking agnostics and the easy-going good fellows who form such a large proportion of the Church of England from habit, will in the future either belong to no Church at all, or belong to the Church which can give them the extreme dose of dogma, discipline, and religious sentiment certain types of mind require.

OTHER ARTICLES.

Sir Richard Temple discourses on the silver crisis in India, not knowing exactly what the result will be. Two writers plead for the Armenians, urging upon England the duty of redressing their wrongs. The only redress which England can give to Armenia is—as I am almost weary of reminding those who wish to recognise facts—to work for a European mandate in favour of a Russian occupation. There is no other way of doing any good in Armenia; as John Bright, indeed, told the Armenian delegates many years ago. There is a contemporaneous account of the Battle of the Nile, written by an adjutant-general of the French fleet, which does not, however, call for any special notice.

THE CHURCH QUARTERLY.

The *Church Quarterly Review* for July is a number much above the average. This review is sometimes extremely dull, but that cannot be said to be the characteristic of the present number. The most readable article is a very brightly written paper on John Ruskin; it is valuable if for nothing else than for its extracts from his works and correspondence. Another readable paper is that of Dorothy Sidney, the original of Sacharissa.

WANTED ANOTHER ATHANASIUS.

The first article on "The Nicene and Post-Nicene Fathers" is devoted to St. Athanasius. The reviewer thinks we stand badly in need of another Athanasius to-day:—

If Arianism exists in the nineteenth century, so also do other forms of thought with which Athanasius came into constant contact. There are young Basils among us, firm in the faith, and yet not unsuspected of error. There are men who in the fullest sense hold the truth, who yet hesitate about the expression. One thing at least is certain. If the Church is to be saved in our day as it was in his, it will be by men who in the spirit of Athanasius will add to gifts of intellect, of moral power, and of leadership, a firm hold of the central doctrine of the Incarnation as taught in the Scriptures and in the Church, will combine with it that doctrine is life and not

merely form, and therefore, as spiritual fathers, will welcome every child who really holds the living truth and acts and speaks in entire devotion to our Lord.

BISHOP WESTCOTT'S "GOSPEL OF LIFE."

The article which is nominally a review of Bishop Westcott's "Gospel of Life" is very long, and is primarily devoted to an exposition of the reviewer's own line of thought. This having been satisfactorily set forth like a sermon under first, second and third, we have the review of the book, which is critical but appreciative. The reviewer says:—

The "Gospel of Life" is nevertheless a profound and valuable contribution to Christian thought. It belongs to the class of theological works which are in the true way apologetic by exhibiting the great harmonies of the Faith. It contains much which is positively constructive. In its details it is suggestive and provocative of thought in a very high degree. It is deeply Christian in the central place which it assigns to the living power of the risen Christ.

THE GOSPEL OF ST. PETER.

A long and learned article is devoted to a discussion of the value of the Gospel of Peter. The conclusion of the reviewer is stated as follows:—

On the whole our conclusion is that "Peter" is so much later than the Canonical Evangelists that he might have copied from them, but that they could not have copied from him; that his variations from them have no trace of having been derived from independent tradition, but have all the marks of being pure invention; and therefore that it is not reasonable to account for his coincidences with them by supposing that he got them from independent knowledge of the traditions embodied in our Gospels when there is no difficulty in believing that he knew the Gospels themselves.

Our verdict is that while we feel the greatest interest in the recovery of a genuine portion of a second century document—interest not diminished by the fact that it throws light on the ideas of a heretical sect, rather than on those of the Catholic Church, concerning which other evidence is abundant—we must pronounce it to be a critical blunder of the first magnitude to treat this document as one that ever had wide circulation or that largely influenced Christian thought.

THE DOCTRINE OF THE PROPHETS.

This article is a review of the Warburtonian lectures of Dr. Kirkpatrick. The reviewer shakes his head solemnly at Dr. Kirkpatrick but rejoices to find he is not so bad as he might have been:—

The whole question is to be properly considered, there is need of more than accurate scholarship and historical and critical skill. True science requires investigation by more methods than one. Specialists are always prone to exaggerate sides of truth or to make still more serious mistakes. One science requires to be balanced by another. In the just discussion of such a subject as prophecy theology has its place as well as criticism, and there is no hope of right conclusions unless the teaching of the New Testament and of the Christian Church is kept in view.

TOMAHAWKING CONGREGATIONALISTS.

The writer of the article on the "Tercentenary Literature of the Congregational Union" goes for Dr. Mackennal and his colleagues, who ventured to print popular lectures on the origin of Congregationalism, in a fashion which recalls reminiscences of the days when ferocity was considered good form. One sentence is sufficient to give as a sample of the slashing style of this reviewer:—

It will be readily imagined, from the exposure which we have already made of Dr. Mackennal's glaring ignorance and uninquity, that he blindly accepts the whole body of the legends of his sect as infallible. Simple ignorance is pardonable; but it is criminal when ignorance affects to be historical, and piles up a heap of guesses, gossip, suggestions, and falsehoods to justify the legends which it has never critically examined.

THE QUARTERLY REVIEW.

THE *Quarterly Review* for July, although very good, is not up to the level of the *Edinburgh*. The best articles are the first and the last; the first on the discovery of America, the second upon the Home Rule Bill.

THE OLD WORLD AS SEEN FROM THE NEW.

The essayist, who has the place of honour with a comprehensive survey of the evidence which led up to the discovery of America and the results which followed, concludes his paper by some general reflections which have as their key-note the familiar line, "Westward the Star of Empire takes its way." One result the *Quarterly* reviewer points out is the dwarfing of the European continent and the creation of a new Mediterranean in the Pacific. Speaking of the Americans, he says:—

In their eyes, the States of Europe have about the same importance as had those of Greece in the eyes of a Roman when his ambassadors were dictating terms to the kings of Asia, and it had become apparent that by-and-by the whole civilised world would belong to him. The Mediterranean, seen from a distance of over three thousand miles, shrinks to a Dead Sea, with deserted Spain and Africa, poverty-stricken Italy, and half-barbarian Hellas lying stranded around it, their part in the movement of mankind over, their charm grown chiefly artistic or antiquarian, and their influence on the western hemisphere absolutely null. As for the German Empire, it is land-locked, necessarily stay-at-home, and crushed under its military burdens. France is an anarchy; Austria is a geographical expression. The only Powers which seem to have youth left in them are colonising England and medieval Russia. Neither of these immense monarchies can fairly be deemed the rival of America; each, as time goes on, will become more and more of a steadfast friend to her. And the new Mediterranean, where these three Powers meet, and which is no Dead Sea but alive with great and growing commercial navies, must we not discern it in the Pacific Ocean, extending as it does to the shores of India and Australia, no less than to those of Eastern Asia? In this most astonishing and unexpected way has the balance of the world's history been shifted from one side of the globe to the other.

THE NEW BATTLE OF HASTINGS.

There was an old Battle of Hastings that was fought between William the Conqueror and Harold. The new Battle of Hastings is that which is being waged over the reputation of Mr. Freeman, the historian of the Norman Conquest. The *Quarterly* reviewer last year devoted himself to a very elaborate and very severe criticism of the historian's account of the famous battle. To him Mr. Archer made an able and detailed reply, and now in the present number the *Quarterly* reviewer retorts upon his adversary much to his own satisfaction, if we may judge from his own summary of what he accomplished:—

We have now established, briefly to recapitulate, that Mr. Freeman is, even on his own showing, wrong in assuming that the English fought behind "wooden walls," and that his "palisade," with all that it involves, must be finally abandoned. We have further shown that his elaborate and confident arrangement of the English forces rests on no authority, and is nothing but a random guess,—a guess to which his own precedent, moreover, is directly opposed. Then passing to the battle, and taking it stage by stage, we have shown that on its opening phase he went utterly astray, in search of an imaginary attack on a phantom palisade. We have seen how another such guess transported to "the western ravine" a catastrophe which cannot have happened there; and we have traced, in our former article, his singular misapprehension of the great feigned flight. Lastly, the critical manœuvre of the day, by which "the Duke's great object was gained," and "the great advantage of the ground lost" to the English, proves, on enquiry—although introduced, like the other assertions, as an historic fact—to be yet another unsupported guess: for the

statement that, by this manœuvre, "the Normans were at last on the hill," and could thus "charge to the east right against the defenders of the Standard" (page 490), there is absolutely no foundation.

LORD SHERBROOKE.

The article on Lord Sherbrooke, better known as Robert Lowe, is very appreciative and sympathetic, as might be expected in a Review to which Robert Lowe contributed three articles—the first against household suffrage, the second against trades' unions, and the third in favour of the endowment of the Roman Catholic Church in Ireland. The *Quarterly Review* still holds to its old thesis that Disraeli's action in 1867 was to be fitly described as the "treachery of the great surrender—that dishonest victory fatal to Liberty." Speaking of Lord Sherbrooke's career, he says:—

But such a life conveys other lessons than those that lie upon the surface. We see him tried by adversity and prosperity, and in both preserving the even tenor of his way. In the midst of success he betrays a doubt whether the game of life is worth the candle; nor could the vexations of his lot prevail over his old-world courtesy, his patience and consideration. By the sweetness and gaiety of his disposition he effectually disguised from those around him the hourly mortifications which blindness imposed.

THE FINE ART OF BOOKBINDING.

Collectors of books will turn with interest to the article on the art or craft of bookbinding, which surveys the whole subject from the terra-cotta cases of Assyria down to the present day. Before printing was discovered, the manufacture of books and their bindings was chiefly carried on by the Church. After the printing press, artistic bookbinding began its history, and when women took to reading books, they became portable. Then bookbinding in wood, precious stones, enamel and ivory, disappeared, and calf, morocco, and parchment came in their place. Venice took the lead in the new art, and the Crusades gave a stimulus to highly-embellished bookbinding as to other things. The French school of binding was founded by Grolier at the beginning of the sixteenth century. Modern bookbinding was introduced into England by Germans, Dutch, and Normans. After the French Revolution, an influx of French emigrants once more reinforced our English bookbinders. There is not so much gossip as is often to be found in articles of this kind; but here and there are items such as that Harley, first Earl of Oxford, employed a firm of bookbinders to bind his library in red morocco at a cost of £18,000. In the British Museum, theology is bound in blue, history in red, poetry in yellow, and natural history in green. Roger Payne, the most famous of English bookbinders, was a drunkard, and died in extreme poverty.

OTHER ARTICLES.

An article upon "Political Spies" tells again the famous story of Le Caron. In the article on "The Privy Council under the Tudors," the writer endeavours—to lay before our readers some samples of the materials for English history contained in the register of the Privy Council; but it must not be supposed that we have to any considerable degree exhausted the interesting contents of this mine of information which is now being made accessible to the general public through the enterprise of the officers of the Council Office.

In the paper entitled "The Fall of the Ancient Régime" the reviewer endeavours to enable his readers to understand the French Revolution by explaining some of the past administrative difficulties which existed between the two countries at the close of the eighteenth century.

THE EDINBURGH REVIEW.

THE *Edinburgh Review* for July is an admirable number. There is hardly a dull article in it, and from first to last a very high standard of interest and of excellence is maintained. I notice elsewhere the remarkable article upon Cardinal Newman and Bishop Lightfoot, and also the historical monograph on Empress Catherine II.

NEWS ABOUT THE CANAANITES.

The first place in the review is given to a very lucid and interesting account of the "Tell Amarna Tablets," the discovery of which has shed a flood of confirmatory light upon the narrative of the Pentateuch. The writer says:—

The testimony of the stones pronounces in favour of the knowledge and honesty of the great writers of old, when traduced by those whose unkempt and ignorant forefathers were driving their wagons over the desolate steppes of the Volga regions, while art and poetry, commerce and literature, were already flourishing among the Chaldeans and Egyptians, the Hittites and Phœnicians, and in the plains of Southern Palestine itself.

The Tell Amarna tablets represent a literature equal in bulk to about half the Pentateuch, and concerned almost exclusively with political affairs. They are clay tablets, varying from two inches to a foot in length, with a few as large as eighteen inches, covered with cuneiform writing generally on both sides, and often on the edges as well. The peasantry unearthed nearly the complete collection, including some three hundred and twenty pieces in all; and explorers afterwards digging on the site have added only a few additional fragments. The greater number were bought for the Berlin Museum, while eighty-two were acquired for England, and the rest remain either in the Boulak Museum at Cairo, or, in a few instances, in the hands of private collectors.

A PLEA FOR THE BIRDS.

The writer of the natural history article makes a very strong protest against the hideous and brutal custom of decorating women's hats with the corpses of singing birds. Apart from this, the practical part of the reviewer is thus stated:—

Something can and ought to be done to enlarge the scope and increase the efficiency of the Birds' Protection Act, passed as long ago as 1880, but hitherto in some vital respects a failure. This Act ordains for certain birds a close time from March 1 to August 1, and by this *some* land birds and sea fowls are scheduled as wholly protected from legal slaughter; but the close time begins a month too late, and ends at least a month too soon, to render the protection of real service. Moreover, it forbids neither nest-destroying nor egg-stealing, though both are causes of ruinous destruction to thousands of broods of young birds, especially along the sea-coast, where dealers are ever on the watch. If these defects could be rectified, landowners persuaded to prohibit the incursions of unlicensed and professional birdcatchers, and if all the real friends of birds would but exert themselves individually in enforcing the law, a great step would be gained towards the abolition of horrors in the fields and woods and hideous head-dresses in the world of fashion.

THE USE AND ABUSE OF WEALTH.

This is the title given to an elaborate review of M. Jannet's article on "Capital, Speculation, and Finance in the Nineteenth Century." The reviewer thus summarises the scope of his article, which is full of facts, and much more readable than financial articles usually contrive to be:—

From one part of his work we have endeavoured to show how the rapid increase of wealth, which has been the characteristic of our own age, has promoted the progress of the world and has improved the condition of the poor; from another part of it we have tried to explain how, in the pursuit of wealth, men

have stooped to practices which have been both fraudulent and injurious, and by their conduct have brought dishonour on themselves and ruin on those who have trusted to them. But, if one part of his work confirms us in our dislike of the new patent inventions for promoting progress by destroying riches, the other part of it makes us hesitate in adopting any drastic methods of purifying the Augean stable.

RUSSIA AND THE PACIFIC.

The writer of this article is, on the whole, not much of an alarmist, although he considers that in the North Pacific lies the key to the whole Pacific Question. His conclusion is that—

Whilst we acknowledge the strength of the Russian position there, we need not dread it. It will be our own fault if we do not resort to the right methods of neutralising it or diminishing it considerably. Whilst the opening of railway communication between Russia in Europe and the coast provinces of Eastern Siberia may add to the defensive, and even offensive, capabilities of the latter, we have seen that they may be viewed also in another aspect. The new line will be a hostage to China. We may anticipate with a fair approach to confidence that the most important result of making the Siberian railway will be an increased demand for those facilities of sea-transport which the British mercantile marine can alone supply.

ONE OF THE ASIATIC LITTLE WARS.

"The Campaign in the Kanjut Valley" gives a graphic account of the campaign led by Colonel Durand against the hill tribes, living where three empires meet between Kashmir, Tibet, and the Russian territories. The story reflects great credit upon our soldiers. The writer, who bases his article upon Mr. Knight's book, says:—

Among our little wars that in the Kanjut valley is entitled to a memorable and conspicuous place. It was noteworthy for the natural surroundings amid which it was conducted, for the conspicuous valour shown on both sides, and, above all, for the complete harmony which seems to have resulted from it. Before Colonel Durand's advance the Kanjutis were at heart the allies of Russia. The events which have happened since the campaign have gone to show that there is no risk of a fresh attack from the Kanjutis, but that we have still to place our house in order with the hillmen of the Indus valley below Bunji.

OTHER ARTICLES.

The other articles cover a wide range of subjects. Walpole's "Isle of Man" is a review of Mr. Walpole's book, "The Land of Home Rule." To the title the reviewer takes the following objection:—

The Home Rule of the Isle of Man is at the most mere gas and water Home Rule. Hence it is obvious that, for the purposes of practical politics, the so-called Home Rule of the Isle of Man is useless, as an example, when we discuss the question of Home Rule for Ireland. It is therefore better to leave the political question of the hour, and to consider Mr. Walpole's interesting work simply and solely as an essay on the Isle of Man.

"The Tragedy of the Cæsars" is the title of the article on Mr. Baring Gould's recent book on the Claudian and Julian Cæsars. The reviewer says it is:—

A very pleasant and readable book, founded on the natural alliance between art and literature continued into artistic and literary comparative studies.

"Sir Henry Maine as a Jurist" is a highly appreciative article based upon books recently published by Sir Henry. The reviewer says:—

Capable workers in historical research are many, directors of research are few. Maine's was, nay is, one of the directing minds.

THE FORUM.

THE *Forum* is a good average number, although there are not many articles which call for special note in England. Mr. Bryce's paper on the "Teaching of Civic Duty" appears in these pages simultaneously with its publication in America. There are a couple of articles devoted to the pension scandal and to the World's Fair. Mrs. Julia Ward Howe's paper suggesting improvements in the Celebration of the Fourth of July is noticed elsewhere.

THE FUNCTIONS OF A CHRISTIAN PREACHER.

Dr. Lyman Abbott, in the *Forum*, discusses the functions of a Christian preacher at some length, and his observations are very much to the point. He tells young men who are thinking of entering the ministry:—

never was "the cloth" or "the pulpit" less venerated than now, never was so scant respect paid to the mere vestment and standing place; but never did an age or a nation so greatly need the prophet, as this age and this American people, and never was age or nation more ready to hear and heed the prophet, if he comes to it inspired by the consciousness of a divine message.

Of the duty of a preacher in the present day he says:—

His message of life is in spirit the same which has been given by the prophets of all the ages, but its form must be adapted to the thought-forms of his own time. And while his immediate object must be the inspiration of the individual, his ultimate object must be so to give that inspiration that a new social order, an order of love not of ordered and regulated selfishness, shall rule in the social, the industrial, and the political world.

THE RUSSIAN EXTRADITION TREATY.

Mr. J. B. Moore replies to Stepniak and others who have denounced the recent extradition treaty between Russia and the United States, meeting each point in their indictment, and finishing up as follows:—

Contemporaneously with the publication of the Russian treaty, it is constantly declared that it is the most comprehensive of all our extradition treaties. If those who labour under that impression would turn to our other treaties, they would soon be convinced of their error. The list of crimes in the Russian treaty is substantially the same as that in our treaties with Belgium, Japan, and Colombia. It is not nearly so comprehensive as the list in our recent treaties with Great Britain, Spain, Sweden, and the Netherlands. The effort to find something extraordinary in the treaty is doomed to disappointment, and may well be abandoned.

POPULARITY OF PLAY WRITING.

Mr. A. M. Palmer has a paper in which he explains "Why Theatrical Managers reject Plays." He says that it is a reasonable estimate that since he began managing theatres ten thousand plays have been read and considered in his office. As he has only been manager twenty-two years, this would give more than four hundred plays a year, and more than one a day. The amount of amateur play-writing in America is simply astounding. Each year brings a new crop of new playwrights, and two years ago, when the *New York Herald* offered a prize for a one-act play, there were six hundred competitors. He thinks that the need of the American stage at present is American plays which would drop the conventional stage Americanism, and give us in their place the gentle, the strong, the correctly-talking, and correctly-behaving characters of American life.

AMERICAN COLOURED GLASS.

Louis C. Tiffany declares that the best American coloured glass and windows are superior to the best mediæval windows. The American artist combines effects

and beauties which were never dreamed of in the past. The prospective importance of this revived art is not to be over-estimated. No artistic employment offers greater advantages to the artisan, and Mr. Tiffany advises the most efficient art students to turn their attention in this direction.

OTHER ARTICLES.

Mr. John Malone, an actor formerly in Mr. Booth's company, gives some interesting reminiscences of Edwin Booth. Mr. Hudson discusses the army as a military training school.

THE NORTH AMERICAN REVIEW.

THE *North American Review* for June is a fair average number. Lady Aberdeen writes brightly and sympathetically upon "The Irish Village at the World's Fair." Professor Samuel Brun points out, in an article entitled "Divorce made Easy," that in twenty years in the United States the number of children involved in the divorce cases tried reached two hundred and sixty-seven thousand, and in one hundred and forty-one thousand cases they do not say whether there were any children at all. One divorce in America, says Professor Brun, was granted because the wife had a sick headache and her husband smoked, while another got a divorce because he insisted on quoting to her St. Paul's text that a wife ought to be obedient to her husband.

Professor Briggs discourses on the future of Presbyterianism, from which we learn that liberal theologians in America are nowhere so uncomfortable as in the Presbyterian Church. He does not think that they will leave it, but they will struggle on inside until the Presbyterian Church becomes as broad, catholic, and progressive as her Congregational and Episcopal sisters.

Mr. Edward Atkinson, in an article entitled "How Distrust Stops Trade," points out the mischief that is being done by the uncertainty about the currency. Another article on "Bimetallism" is that by Mr. Leach, an ex-director of the Mint. It is a survey of the silver legislation and its results. Mr. Leach is dead against the silver currency.

Mr. Tourgee, writing on the "Anti-Trust Campaign," strongly presses for laws to break the power of capitalist trusts of every sort and character. This he thinks is necessary to relieve American civilisation of the peril of feudalism based on wealth.

Dr. Ingersoll argues in favour of admitting the Chinese to the United States, stating the case in favour of toleration with great force and eloquence. He denounces the Geary law excluding the Chinese as being as inhuman as the Russian order for the expulsion of the Jews. Mr. Geary, the author of the law, defends the exclusion of the Chinaman on the ground that Chinese labour is organised practically on the basis of slavery, and that the American free labourer is ruined by the heathen Chinese. The Pacific States which contain nine-tenths of the Chinese in America are unanimous against any more being allowed to come in. He concludes his article by declaring there is no room in this country for the establishment of foreign governments for the races who are not willing to submit to the authority of our American laws.

Professor H. B. Boyesen tries to explain the Norwegian political crisis to American readers. Mr. H. G. Prout, in an article entitled "The Fastest Train in the World," describes the train between New York and Chicago which covers 1,900 miles in forty hours. The train is timed to do nine hundred and sixty-four miles from New York to

Chicago at an average speed of forty-eight miles an hour, including nine stops. Twenty-five miles are run at the rate of seventy miles an hour, and one of these miles was run at the rate of eighty-four miles an hour. The train by which this is done runs on the New York Central and Lake Shore railroads. It is called a twenty hours' service. Mr. Prout thinks they will get down to eighteen.

The Marquis de St. Carlos describes "French Girlhood" in an article written apparently to make American girls thank their lucky stars they were not born in France. Mr. George A. Stuart describes "International Yachting in 1893." He says that, for the International Cup race of this year, yachts have been built to the value of not far short of a million dollars, and most of them will be obsolete by another year. Dr. Louis Robinson, whose photographs of new-born babies hanging on by their hands to a tree branch will be familiar to our readers, has a brief paper entitled "The Natural History of the Hiss." All birds and animals that rear their young, and climb trees, hiss when in danger. Dr. Robinson thinks that they have adopted it because nothing frightens their enemies so much as snakes. Animals hiss therefore to deceive their enemies into the belief that they are face-to-face with serpents.

THE ARENA.

MR. COULSON KERNAN, the author of "A Dead Man's Diary," whose portrait figures as the frontispiece of the July number, gives the confessions of a suicide, which he took down from the lips of the man in question while he was in a condition of intense mental excitement. It was upon the experiences thus received that he wrote the "Dead Man's Diary."

WHO WROTE SHAKESPEARE?

This number contains the first instalment of the verdict of the jury which Mr. Flower empanelled for deciding whether or not Shakespeare wrote the plays which have made his name immortal. It is an odd jury. Of the nine who give their judgment this month, Mr. G. Kruell is the only one who believes that Bacon wrote Shakespeare. Mr. Frothingham and Miss Willard incline to a theory of a composite authorship, but Mr. A. R. Wallace, the Marquis of Lorne, Henry George, and three others of less note, are all in favour of the Shakespearian authorship of Shakespearian plays. Mr. George expresses what is a very general opinion when he says:—

Nothing but perversity could attribute Shakespeare's plays to Bacon. If, in your tribunal of literary criticism, there is in use any phrase that will soundingly declare the allegation preposterously false, and the "allegators" wanton and pestilent disturbers, record it as my verdict in this case.

CHRIST, HIS CHURCH, AND WHISKY-SELLERS.

Most of the papers in this number deal with American subjects; two of them are devoted to the money question. Mr. George B. Brown has a paper on "Christ and the Liquor Problem," which is a bold attempt on the part of a whisky dealer to prove that the Methodist Church of the States is on the wrong track in refusing membership to whisky dealers. After quoting the familiar text about the Son of Man coming eating and drinking, and being accused of being a wine-bibber and a friend of publicans and sinners, Mr. Brown says:—

From this it is evident that Christ used, as was customary among His friends, an intoxicating liquor as a beverage; and if He were to come again upon the earth in human form, and to live exactly as He did when here, the Methodist Church would have to change its Book of Discipline in order to admit Him to membership therein, as certainly, from its

present position, He would not be moral enough to become a member of such an association.

REALISM IN GERMANY.

Dr. Emil Blum has a very interesting paper on the "Realistic Trend of Modern German Literature." Dr. Blum says that, in the eyes of the realist, love is sexuality, and as a passion is not classified as a higher psychic motor than other passions such as egotism, ambition, pride, race feeling, or pity. He speaks very highly of Hermann Conradi's "Adam Mensch," which is the most horrible, most repulsive, yet the most attractive book another novelist of the same school has ever read, from which it may be inferred that it is, as he says, shocking indeed. Of the same school is an ardent anarchist, John Henry Mackay by name, whose sentiments Dr. Blum says are best presented by his own words, "I hate this life, this miserable life, with growing hate," from which it would appear that sensible readers should give modern German realism a wide berth.

SHOULD WOMEN BE TAUGHT THEIR BUSINESS?

Rabbi S. Schindler, in a paper entitled "Innocence at the Price of Ignorance," speaks out very sensibly as to the absurd and wicked notion that prevails in many quarters as to the duty of keeping women in ignorance of everything that it is most important they should know if maternity is to be the chief duty of their lives. He says:—

We know that we have to bear all the consequences of all the acts committed by a long line of ancestry; and still we do not as yet know how to use these eternal laws to advantage, simply because our experience has ever remained individual, and has never become universal, as was the case in other branches of science. Especially that half of the human kind upon whom nature has laid the strictest obligation to take care of the future, viz., the female sex, which has more to suffer from any infringement upon natural laws than has the male sex, is left to grope in the dark; is thrown upon mere instinct, and kept in the darkest ignorance as to the laws upon which depend, not only their own welfare, but that of their offspring. They are taught a multitude of things, and yet the greatest secrecy is kept in regard to the most important relation into which they are to enter.

A Programme for Working Women.

In the last of Helen Campbell's papers on "Women Wage-earners," which have been running for some months past in the *Arena*, the following six points in the programme of the Working Women's Society of New York are given as the most succinct women's programme that has yet been drawn up in the United States:—

1. To encourage women in the various trades to protect their mutual interests by organization.
2. To use all possible means to enforce the existing laws relating to the protection of women and children in factories and shops, investigating all reported violations of such laws; also to promote, by all suitable means, further legislation in this direction.
3. To work for the abolition of tenement-house manufacture, especially in the cigar and clothing trades.
4. To investigate all reported cases of cruel treatment on the part of employers and their managers to their women and children employees, in withholding money due, in imposing fines, or in docking wages without sufficient reason.
5. To found a labour bureau for the purpose of facilitating the exchanging of labour between city and country, thus relieving the overcrowded occupations now filled by women.
6. To publish a journal in the interests of working women.
7. To secure equal pay for both sexes for equal work.

These points are the same as those made by the few clubs which have taken up the question of woman's work and wages, but thus far only this society has formulated them definitely.

THE REVUE DES DEUX MONDES.

WE have noticed elsewhere M. Mimande's curious account of the French penal settlement at Nouméa.

THE ITALIANS OF TO-DAY.

In the *Revue* of July 1st M. Bazin begins a series of articles on "The Italians of To-day," in which he describes the provincial life of northern Italy. There is no greater popular fallacy, he says, than that which declares the Italians to be a lazy people, at any rate as far as the peasantry are concerned. He has himself taken walking tours all over the Roman Campagna and round Naples, and everywhere he found laborious and patient workers. Were it not for the huge land tax of thirty-three per cent., he points out that the Italian peasant might become as prosperous as his French brother. Like most of those who have travelled in Italy, M. Bazin was much struck by the rarity of silver. On one occasion he had to accept as change ten francs worth of coppers.

M. Bazin gives an interesting glimpse of the King and Queen of Italy on the occasion of their opening an asylum for the blind at Milan. The King arrived first in a carriage and pair; he was dressed in broadcloth and had on a tall hat; as soon as he stepped into the entrance hall of the Institution he signed to those around him who had uncovered themselves to put on their hats, and then spoke to each in a low clear voice. His attitude was entirely military, and it was easy to see that he likes standing while talking. "His moustache is terrible," observes the French scribe, "though less so than that represented on his presentment on the Italian coinage."

Ten minutes later the Queen arrived in a splendid carriage and four; she wore a black velvet hat covered with feathers, and a dark blue gown. The most striking thing about her countenance are her long golden eyelashes. M. Bazin also noted how admirably she understood and fulfilled her duties as Queen, making herself especially gracious to the poor, humble, and afflicted.

AN ITALIAN ELIZABETH BARRETT BROWNING.

In a rapid sketch of modern Italian literature, the same author makes special mention of a young poetess, Signorina Ada Negri. This young lady who is only twenty-two years of age, is the daughter of a poor widow at Lodi. At the age of eighteen she became an elementary schoolmistress, and two years later published her first volume of verse "Fatalita," which obtained an immediate success, for in it the Italian girl poured out all her heart, and described her sad poverty-stricken childhood. Signorina Negri was lately appointed mistress in one of the best government schools of the land, and it is said that she is now writing a long and ambitious poem.

JOSEPH DE MAISTRE.

M. G. Valbert gives, in a few pages, a vivid description of the youth of Joseph de Maistre, the famous author of "Les Soirées de Saint Pétersbourg." The De Maistre family came originally from Languedoc, and Joseph was one of fifteen children, being born on April 1st, 1754, at Chambéry. His father had very strict and rigid ideas as to how young people should be brought up, and long after he had reached the age of manhood the future writer never opened a book without first asking the permission of his redoubtable parent, who had been nicknamed by his friends "The Block of Granite." De Maistre was for long years the pupil of the Jesuits, to whom he always remained most loyal and devoted, and many years after he wrote to a friend, "My grandfather loved the Jesuits, my

father loved them, my beloved mother loved them, I love them, my son loves them, and his son will love them, should the King ever allow him to have a son."

M. Du Bled continues, in the same number, his "History of Franche Comté," a province which played a great part in monarchical France, and which can boast among its children many famous men.

THE FUTURE OF MEXICO.

In the *Revue* of the 15th of July, M. Fouillé writes a long and learned article on "The Science of Life," and M. Jannet contributes an account of Mexico both from the social and economic point of view, which might be read with advantage by any intending settler in Central America. Should coal-mines ever be discovered on Mexican soil, M. Jannet declares that that country will become one of the greatest wealth-producing countries in the world, but of course without coal the most valuable mineral treasures must lie dormant. The American Indians, who apparently find it easy to work and exist in Mexico on very little, have driven out the European emigrants, and there are in all, says the writer, some four or five thousand French established there.

CATHERINE II.

M. Rod, in the same number, discusses the evolution of modern Italian literature, and attempts to give some idea of the methods and work of Signor A. Fogazzaro, a poet-novelist whose writings seem to be as popular in Germany as Italy. The Marquis d'Aragon, who has been fortunate enough to obtain the advance proofs of a forthcoming volume of letters addressed by the Prince de Nassau Siegen to his wife during the former's journey through the Crimea with Catherine II. of Russia in 1781, gives a vivid account of the great Empress's famous progress, and throws many curious sidelights on Potemkin's character, whilst of Catherine he quotes the following brief description:—

No one can form an idea of her absolute simplicity of manner; her conversation is charming, and when she discusses any subject she unconsciously betrays her wide and varied knowledge and wit. She would have been in private life a most charming person.

OTHER ARTICLES.

We have an exhaustive study *re* the fur-producing seal, by M. Plauchut, and an explanation by M. Dex of the various methods attempted with more or less success by those modern alchemists who hope to discover some way of making artificial diamonds. M. Dex seems to have a considerable practical knowledge of the subject. The Vicomte de Vogüé's article, "An Inquiry about Egypt," is really a review of a book lately published in Paris by the Duc d'Harcourt, entitled "Egypt and the Egyptians."

A BLIND TYPEWRITER.—Typewriting is about the last profession to which a blind man might be expected to devote himself; but Mr. W. H. Hemming, of 6 Gilbert Road, Peckham, informs me that he is prepared to do typewriting work thoroughly and accurately, either in copying manuscript or in working to dictation, or in addressing envelopes just as if he were a sighted man. He does this by the aid of his wife, and has a Yost machine with an improved keyboard constructed from the suggestion of Dr. Campbell of the Royal Normal College for the Blind. Possibly there may be some of our readers who, having typewriting work to dispose of, and not knowing exactly where to turn, might like to give a blind man a chance.

THE NOUVELLE REVUE.

WE have noticed elsewhere the articles on "Political Economy and the Gospel," and Mary Clementina Sobieski. In the *Revue* of July 1st Savvas Pacha contributes, under the form of a letter written to the Editress of the *Revue*, a fourth and concluding article on idealism and realism in the fiction of to-day. In a careful analysis of "La Terre," he attempts to prove that Zola has, in reality, only shown an incomplete side of French rural life, for it is his contention that no true realism can exist without idealism.

A LOST HERITAGE OF £17,000,000.

An anonymous article gives a curious but somewhat involved account of the so-called Bonnet Heritage, which has been, declares the writer in the *Nouvelle Revue*, in the hands of Great Britain since the death of a certain Claude Francis Bonnet, one time King of Madagascar, who, towards the year 1783, seems to have confided a large fortune to John Company, which his numerous descendants have ever since been trying to reclaim. The author of the article does not deny that the English made several attempts to restore the money to Bonnet's heirs. As late as 1824 the Admiralty informed the French Government that a certain M. Bonnet, deceased at Calcutta, had left to his French relations an immense fortune. But before the fortune could be given over the Bonnet family were asked to produce the death certificate of their wealthy great uncle. This, apparently, they have never been able to do, and it certainly, from the French point of view, does seem hard that Great Britain should now be enjoying a sum of £17,000,000 sterling, which might be utilised in making happy dozens of well-meaning Bonnets.

ART IN ALGERIA.

M. Marye in an account of the artistic education of Algerian natives points out that France might utilise to great advantage the undoubted artistic tastes and capabilities of her African subjects. Why should not, he asks, an art department be opened in each national school? In old days the Arabs produced exquisite works of art with the most primitive instruments. Already the French Minister of Public Instruction is about to found a museum of Mussulman art in Algiers, and M. Marye also recommends the establishment of a native *salon* where once a year native artists could show their work.

THE M.F.H. IN FRANCE.

M. de Wailly, continuing his series of articles on modern sport, describes the duties, trials, and pleasures of a M.F.H., and gives a passing mention to the best known sportsmen in France, at whose head he places the Admiral Prince de Joinville, the happy possessor of ninety English stagbonds, and who organises the great hunting parties at Chantilly and Rambouillet. The two ladies whom M. Marye honours by a mention are the Duchesse d'Uzès, Boulanger's one time supporter and friend, and Madame Bischoffsheim.

ROUSSEAU'S JULIE.

In the *Nouvelle Revue* of July 15th, M. Rossel has been at much pains to reconstitute the personalty of Madame de Warens, the lady who played so great a part in Jean Jacques Rousseau's early life, and whom he somewhat cruelly immortalised in his celebrated confessions. M. Rossel gives anything but a pleasant picture of the "Maman" to whom the author of "La Nouvelle Heloise"

was at one time so tenderly attached. But he admits that she had a salutary effect on Rousseau's literary style, and says that in depicting Julie he was really inspired by his memories of the hostess of Les Charmettes.

THE FRENCH NATIONAL LIBRARY.

In the same number, M. de Dubord gives an interesting account of the Bibliothèque Nationale. Charles the Fifth seems to have been the first individual public-spirited enough to wish to share with others the riches of his library, which then consisted, we are told, of 1,200 volumes; even when Louis the Fourteenth came to the throne there were only about 5,000 books in what was then called the Royal Library. During the eighteenth century a great number of eminent personages left both their libraries and collections of medals and engravings to the Bibliothèque, and in the year of the Fall of the Bastille, 1789, the Paris public library could boast of 300,000 volumes. The great Revolution, which destroyed so much that was priceless in the way of works of art, and royal collections of all kinds, proved a positive benefit to the Bibliothèque Nationale, for to it were taken all the rare manuscripts and printed books found in the convents and monasteries. Like that happy nation of which we have all heard so much, the French National Library may be said to have had no history worth recording till the Franco-Prussian War, when there was great fear expressed lest an ill-directed bomb might set fire to the splendid block of buildings in the Rue Vivienne. During all those weary months the large *personnel* of the Bibliothèque remained admirably faithful to their duties, and even during the Commune the library escaped all damage. Unfortunately the many priceless bibliographical treasures contained in the Bibliothèque Nationale have never yet been clearly catalogued in any methodical manner, and the would-be reader has sometimes a great deal of trouble to find what he wants. M. de Dubord makes an eloquent appeal to the French Government for more funds. He points out that the British Museum has an income of over £50,000 a year, whilst last year the Bibliothèque only received something like £31,000.

EMANCIPATION OF THE FAIR SEX.

M. Quesnel writes an article on the Emancipation of Woman, apparently suggested by Frau Crepaz's book, "The Emancipation of Women and its Probable Consequences," a volume which attracted, it will be remembered, the favourable notice of Mr. Gladstone. The French writer has very little sympathy with the views expressed by the German lady, and is evidently all in favour of the Emancipation of Woman, for he entirely denies any of the "Probable Consequences" feared by Frau Crepaz. As befits a gallant Frenchman he refuses to believe that the free woman will become masculinised and lose half her charms, and he points to the American girl as an instance of what a charming creature an emancipated woman can be. Indeed, he goes even further, for he declares that it is the most intelligent, not the least wise women who have the most children; but he adds prudently that he had better not venture into that rather delicate question.

In the *Sunday at Home* Mrs. Brewer has a couple of papers on "Foreigners in London," describing the Asiatics and Africans who are to be found in our city. About ten or twelve thousand Asiatics enter London yearly; a few hundreds are Parsees and Japanese, the rest are mostly Chinese, Malays, and Indians. In religion they are mostly Mohammedans, Buddhists and Hindoos. Two thousand five hundred of them are Chinese.

SOME ILLUSTRATED MAGAZINES.

The Quarterly Illustrator.

THE midsummer number of the *Quarterly Illustrator* is an American venture which started this year. It is a kind of quarterly REVIEW OF REVIEWS for the illustrated magazines of the world, and is published by H. C. Jones, 92 and 94, Fifth Avenue, New York, at thirty cents a copy, or one dollar a year. It is admirably printed, the illustrations are selected from a wide range, and as a picture book it is one of the best now published.

The Cosmopolitan.

WITH the July number the *Cosmopolitan* begins at half its previous price; instead of being supplied at 25 cents, it is in future only to cost 12½ cents. The high character of the illustrations of the magazine is maintained unimpaired. It publishes no fewer than three frontispieces, if we may so call them, and the illustrations of several of the articles are even above the average. "The World's Fair at Chicago as a Turning Point in the Arts" is carefully written and well illustrated. The article on the great railway systems of the United States deals with the Central and Pacific Railways. Another excellently illustrated paper is "Engineering with a Camera in the Canons of the Colorado." The cliff-dwellers of New York describe life in the enormous sky-scrapers which in the opinion of the writer of the article are setting an example to the old world as to the way in which apartment houses should be built. M. Flammarion's penultimate paper about "The Future of the World" is noticed elsewhere. Mr. McCracken has a paper on the Referendum, which he says is now a plank on the platform of every association of political reform in America. The Referendum alone is capable of restoring to the citizens that personal exercise of political rights which is the heritage of free men.

Harper's.

THE first place in *Harper's Magazine* is devoted to a well written and copiously illustrated account of the Cock Lane Ghost. Mr. Howard Pyle tells the story of the mysterious rapping and scratching, which in the eighteenth century were supposed to emanate from a poisoned Miss Fanny. Mr. Pyle in reviewing the evidence evidently inclines to a belief that there was something genuine about the manifestations. It is very curious to see the tendency to rediscover the supernatural cropping up in all directions. A sketch of Greenwich village—the Greenwich being, not on the Thames, but in New York State—is full of pleasant illustrations of old time life in the New World. We have the second instalment of the paper upon Italian gardens. Colonel Dodge adds the "Riders of Tunis" to his series of papers about the horsemen of all lands. There are one or two papers on natural history and on travelling, but the bulk of the rest of the number is devoted to fiction, serials, and short stories.

McClure's.

McClure's Magazine continues to be light, bright, and readable. The frontispiece of the second number is a portrait of Oliver Wendell Holmes, who is interviewed by Edward E. Hale. The article is illustrated and pleasant, but rather slight: the conversation chiefly turned upon Emerson. Dr. Holmes devoted a year to the study of Emerson's life and works in order to write his Emerson in the "American Men of Letters" series,

but very few people seemed to appreciate the value of the work. Mr. Blathwayt's paper on "Wild Beasts" is noticed elsewhere, so is Mr. Rudyard Kipling's "Ballad of the Sea." The "Portraits of Celebrities" include Mr. Hale and M. de Blowitz; of the latter it seems to be impossible to discover any portrait earlier than 1866. A less familiar name is that of D. V. Urrabieta, a Spanish artist, who is said to be at the head of the contemporary illustrators. Mr. Edison figures at the age of three, thirteen, thirty-one, forty-four and forty-six, and also there is an account of "M. de Blowitz at Home." The article on the "Race to the North Pole" contains an account of the expeditions of Nansen, Perry, Gilder and Jackson.

The Century.

THE most notable article in the *Century Magazine*, both for illustrations and for its subject, is the first, Stephen Bonsal's account of "Fez, the Mecca of the Moors." The pictures stand out from the page very remarkably. There is also a striking page devoted to the Emperor Louis Napoleon in the article on "The Prince and Princess Achille Murat in Florida." The art articles are devoted to Japan and Sweden, and very remarkable some of the are. The work of Anders Zorn, the Swedish etcher, reveals new possibilities in etching. The "Famine in Eastern Russia" gives an interesting account of the relief work of the young Tolstoy. The only other illustrated article is that devoted to "International Yachting." A pleasant, but not an illustrated paper, is filled with Dr. Phillips Brooks's "Letters to Children." Another paper, which has no illustrations, is an account of a Philosopher's Camp. The article is written by Mr. V. J. Stillman, and tells the story of that pleasant companionship in which Emerson, Agassiz, Lowell, and others, were of the party. Longfellow was to have gone, but he declined on hearing that Emerson was going to take a gun. "I shall not go," said he; "in that case one will be shot."

Scribner.

Scribner is almost entirely given over to fiction. It contains six complete stories. There is one article that redeems this barren waste of romance, and that is Mr. Julian Ralph's article on his experiences as a newspaper correspondent. Mr. Ralph appears to be a phenomenal worker, and sometimes writes from seven to ten columns of special descriptive matter in one day. When he did the last Presidential Inauguration, he got up at five o'clock in the morning, drove round the city to see the people come in, had breakfast, drove round the city again, called at the White House, gossiped with the crowd, saw the ceremony, had lunch, and sat down at half-past one o'clock to write steadily for twelve hours, with messenger boys carrying his copy off to the telegraph office, with sometimes only eight or ten words written upon each piece of paper. The article is about the best kind of one phase of American newspaper life I have ever seen.

The Pall Mall Magazine.

EXPENSE is evidently no object in the production of this periodical. This month we have a coloured frontispiece, charmingly executed, while the illustrations are at last attaining something like the American standard; there is still a good deal to be desired in some of them, but others are very good indeed. The paper describing a cruise on the Kennet and Avon Canal from Reading to

Bath is charmingly illustrated. Mr. Mallock, I am glad to see, has adopted the diagram as a means of illustrating his ideas as to the distribution of wealth. W. A. Alden's story of "A Darwinian Schooner" will attract many readers. The excitement occasioned by the action of the French in the far East adds to the interest of Mr. Curzon's description of the capital of Annam. Dr. Conan Doyle, Mr. Roden Noel, and Mr. Lewis Morris contribute the poetry. An anonymous writer, who has no love for Lady Jeune, writes on society, and lays all the blame for its shortcomings on the plutocrats who have swamped it of late years. Mr. Zangwill, writing the gossip at the end "without prejudice," devotes some paragraphs to the "Second Mrs. Tanqueray." In one of the paragraphs Mr. Zangwill says:—

I am sometimes tempted to the conjecture that the sowing of wild oats by the man is a necessary phase in the development of his character. Just as the human embryo repeats all the animal stages by which man rose from the ranks of the amoeba, before it settles into the human figure, so the spiritual man goes through all the savage experiences of his race in the development from polygamy to monogamy. Marriage is the world-experience redemonstrated in the individual.

It would be interesting to know whether Mr. Zangwill is also tempted to the conjecture that similar conduct is an equally necessary phase in the development of woman's character. She also was a human embryo, and if the spiritual man must pass through polygamy to monogamy, why should the spiritual woman not also pass to the same stage from polyandry? What is sauce for the gander is surely sauce for the goose.

The English Illustrated.

THE *English Illustrated Magazine* promises to be the best sixpenny illustrated from the point of view of illustrations and general interest. It has been enormously improved since it left Messrs. Macmillan. I notice Mr. Ruskin's letters and "Hartmann the Anarchist" elsewhere. After these the most interesting paper is the one on poachers and poaching, by the admirable writer who signs himself "A Son of the Marshes." Mr. George Gissing and Robert Buchanan contribute short stories; the Duchess of Rutland begins an illustrated article upon Belvoir Castle, and Mr. Adderley writes pleasantly and from knowledge of the work that is being done in the East End of London for the civilisation of the masses of our people. The only bad thing about the article is its title, "Is Slumming Played Out?" which gives very little clue to the nature of its contents.

The Strand.

'In the *Strand Magazine* the success which has followed Dr. Conan Doyle's detective stories has suggested to Mr. Newnes the propriety of filling up his series from the stories of the *Diary of a Doctor*. The new series has been begun by Mrs. Meade, whose *Medicine Lady* seems to have suggested the working of this new vein. The first article in the *Strand* is devoted to Buckingham Palace, which is written by Mary Spencer Warren, and is illustrated by many photographs of the interior, hitherto unpublished. Miss or Mrs. Warren—why do not women always mention their status when they write?—gushes at length over the Palace and of its treasures and its mistress.

The Idler.

THE *Idler* devotes the first page to a very elaborate article, copiously illustrated, about the royal pets at

Sandringham. The paper is carefully written, and there are portraits of an endless series of dogs and horses, but after a time you are apt to get bored with catalogues of pets. Mr. Zangwill begins a story of the Jews in George III.'s time, under the title of "The King of the Schnorrers." The "Memoirs of a Female Nihilist" are illustrated by an artist who makes the female Nihilist much more romantic-looking in person than she could possibly have been in real life. The interview with Mr. Jones is alluded to elsewhere, as also Mr. Morley Roberts', account of his first book, "The Western Avernus." Mr. Roberts has tried some forty different callings in his time!

A Home of Peace for the Dying.

I HAVE repeatedly called attention to the scandalous omission in English institutions of homes of rest and peace for the dying. With the exception of Friedenheim, a small institution in the north of London, there has been no place where friendless men or women upon whom is the hand of death can retreat in order to close their eyes in peace. The philanthropic enthusiasm which glows in the West London Mission has led Mr. Howard Barrett and some friends to establish a Home of Peace which they call St. Luke's House. This institution was opened on the 14th of last month by Lady Battersea. It contains sixteen beds, six for men and ten for women. There will be no distinction of creed or absence of creed in the applicants. It costs £50 to keep one bed going for a year, and £10 to fit up each bed. Mr. Barrett says:—

The list of institutions already existing, who receive such cases, is lamentably small. Miss Davidson's admirable home in Mildmay Road—the first in England—has lately removed to very large and beautiful premises in Avenue Road, N.W., where she can accommodate forty patients. The Roman Catholic Hospital of SS. John and Elizabeth, Great Ormond Street, devotes several of its beds to this purpose regardless of creed. The Anglican Sisterhoods in charge of St. Peter's Home, Kilburn; St. Joseph's, Kensington; St. Cyprian's, Edgware Road; and the Hostel of God, Clapham; open their doors to a certain proportion of such cases, mostly, however, to women only. But the fact remains that, so far as we have been able to ascertain, Miss Davidson's "Friedenheim" and "St. Luke's House" are the only two places in or anywhere near London (or, I believe, in England) wholly set aside for the care of the dying, and it is manifest that the present accommodation is utterly inadequate to the existing and urgent need, and touches only one here and there in the melancholy throng.

The subject was dealt with in an interesting and touching story in the *Woman's Herald*, of July 27, where the heart of a woman and the imagination of a novelist were all employed in enforcing the need for such an institution. But no art or skill can heighten the eloquence of the simple fact that all men must die, and that civilisation in London has not provided for scores and hundreds, and even for thousands of them, any place in which to die.

A Sign of the Times.

IN the *Month* there is a remarkable article entitled "A Convert through Spiritualism." Is the Rev. Father Clarke going to discover that Spiritualism may become the hand-maid of the Church? The writer of the article was a Protestant who was brought into the Catholic fold solely through teachings received at these séances which Bishop Bagshawe regards as modes of holding intercourse with the devil.

THE CHRONICLES OF THE CIVIC CHURCH.

THE FORTHCOMING CONFERENCE AT LUCERNE.

HOTEL DE L'EUROPE, LUCERNE.

IT is the loveliest place that I have ever seen. For lake and mountain, woodland and island, crag and cataract, for unique and unapproachable perfection there is no place like Lucerne. Derwentwater among English lakes, Loch Lomond in Scotland, Killarney in Ireland, Maggiore in Italy, are each supreme, but one and all must pale their ineffectual glories before the

romantic Lake of the Four Forest Cantons. A great snowstorm raged at the beginning of the week in the mountains through which the Furka Pass winds its way to the glacier source of the Rhone, and as a result the towering summits of the Alps are as if clad in white samite, mystic and wonderful. Sitting here at the open window I see Lucerne as a queen enthroned on the waters, her left arm resting on the wooded slopes of the Rigi, while at her right the jagged crags of Pilatus pierce the clouds. Between the two the whole southern horizon is encircled by a great amphitheatre of mountains, whose dark and sombre majesty is relieved here and there by the gleaming silver of the snowfields on the higher ranges beyond.

The snow-covered shoulder of the giant Titlis is just visible over the nearer hills, the radiant ermine of nature is spread over the great range that stretches from Rigidalstock to Hasenstock, but the crowning glory of the sublime expanse of lake and firmament and mountain range is the mighty mass of the Tödi, which, covered with snow as with a mantle, fills in the great gap between the serrated peaks of the Rotharen and the bosses of Mount Niederbauen. The lake gleams and glitters in the radiant sunlight with a restless shimmer of golden glory. There is barely enough wind to ruffle the azure surface, but the water throbs and trembles with tiny wavelets, and every glancing sunbeam finds a thousand mirrors on its wide expanse. You see glimpses of it here and there through the trees, now

arrayed in all their summer greenery. Yonder the sedgy margin of the lake suddenly thrusts out a broad carpet of green into the water, nearer the city it is the lake which creeps with graceful curve into the shore. The meadows, not dry and bare as those at home, but rejoicing in luxuriant verdure, are as brightly green as the lake is blue. Only one cornfield is visible, a small patch of gold on the crest of the wooded hill round

which the lake winds on its way to Kussnacht; all else is green with the innumerable shades of grass and woodland, which forms the pastoral foreground of the more stern and rugged splendour of the towering peak and radiant snowfield.

Lucerne city sits on the marge of Lucerne lake, like the lady of the lake sole sitting by the shores of old romance. The old wooden bridges, with history emblazoned beneath the arches of their roof, still as for four hundred years help the citizens to cross dryshod their rushing river, and still on the Mussegg frown the quaint old towers which, before the days of gunpowder, enabled its doughty burghers to defy the threats of marauding nobles or of hostile states.

The great organ fills the lofty aisles of the ancient cathedral. On Sunday Dr. Glover preached in the Rathhaus between four walls carpeted with the portraits of ancient burgomasters immediately above the historical collection of the city museum. Just inside the walls the Old Catholics worship in their newly-erected church, in the capital of the canton, which was once the Jesuit stronghold. North of the city may still be seen the mortuary chapel which marks the battlefield of Sempach, and every year, with banner and with song, the school-children assemble from near and from far to celebrate in festival the anniversary of that great day, five hundred years ago, when the allied Switzers broke the yoke of their Austrian oppressor. On the other side of the lake at Stanz they still lovingly show you the birthplace and

MOUNT PILATUS

the relics of Arnold of Winkelried, who made way for liberty at Sempach by burying the Austrian spears in his body. Further to the south there is Tell's chapel, and the famous meadow of Rutli, where the great oath was sworn out of which the Swiss Republic was born. The very air is tremulous with the echoes of the past, which still reverberate among the hills. Not even the vile-smelling smoke of the Swiss locomotives—the vilest in all Europe—can destroy the aroma of romance which suffuses everything. Religion, romance, poetry, war, history—all that is most sublime in human heroism or most pathetic in human passion—all are crowded in upon the mind, as if it were not enough to have the most perfect natural beauty as a dower, but that of places as of persons the great word holds true—"to him that hath shall be given."

Lucerne, beautiful for situation, and the joy of the whole earth, lives vigorously in the present and confronts with serene and hopeful brow the developments of the future. The streets that lie behind her ancient ramparts are all lit with electricity; the river Reuss has been bridled and bitted and made to drive all the machinery in a composite factory, where the same shafting, driven by the water power from the lake, polishes diamonds in one room, helps to make bicycles in another, and drives the forge-hammers in a third. On the lake naphtha and electric launches flit about noiselessly and swiftly, as if propelled by unseen genii; chalets nestle beneath the crags on the lakeside as the nests which the twittering swallows build under our eaves, whose owners wrest by untiring labour a harvest from their rockbound soil. Deep down in the soft translucent water the fish flash to and fro, and in the noontide heat the swimmer plunges with joy into the liquid coolness of the lake. In the evening the bands play in front of the great hotels, and the strains of their music are heard fitfully on the water as the belated boating parties hasten homeward in the twilight. It is here where for this year the Grindelwald Conference has established itself to discuss among the fairest of earthly scenes the fairest of earthly dreams—the reunion of Christendom—when "they may be one even as we are one."

This month I spent ten days at the Reunion Conference, saying a word as occasion offered for the Civic Church. Dr. Lunn, the president of the Conference, was good enough to ask me to return in September, when three days will be set apart for the consideration of the Civic Church as a practical means of securing the reunion of Christendom. The basis of reunion which has hitherto been favoured by the Grindelwald Conference has always seemed to me much too narrow. It is limited to the so-called Orthodox Christian denominations—that is to say, to those churches which in their creeds profess to assent to the doctrine of the Trinity and of the Divinity of Our Lord. As a basis for the reconstitution of an organic denomination this is too broad; as a basis for securing the co-operation of all men

and women in carrying out the work which the Church was instituted to accomplish—the salvation of the world—it is a great deal too narrow. There is no chance of securing uniform creed, uniform ritual, or uniform church government. Even if the existing sects, whether Roman, Anglican, Greek, or Nonconformist, were not in existence, if the field were cleared of those crystallised boulders of churches which block the path of reunion, the attainment of such uniformity could never be accomplished, and if attained by miracle could never be sustained. Men can no more be all of one sect than they can be all of one stature. Hence reunion on the basis of uniformity either of creed, ritual, or church government is utterly impossible. As long as men are born different with characters which are the net outcome of the influence of hundreds of generations, so long they will worship the Highest in different ways, so long they will formulate their conceptions of the Infinite in different fashion, and so long they will constitute their

church systems according to the prejudices, principles, and necessities of their own elective affinities. All that can be done in the direction of reunion is to slacken the stress or friction of the existing rivalry, to constantly insist upon the superior importance of the welfare of the whole over the particular or personal interests of any single sect or section of a sect. But although it is impossible ever to get all men and churches to agree to preach or to pray or to praise in common, it is not impossible to get their members, and others who are not members, to think, to discuss, and to act together in grappling with the great social and national questions which confront society.

Thus it has always seemed to me that the only practical means of reuniting Christendom is to begin the other way about. Instead of seeking to get the churches to unite and form one church, the true plan is to form a civic or municipal or national union, comprising all existing churches and all who will co-operate with them in any given geographical or social unit, which would undertake in common those works of utility and of righteousness which can only be undertaken by the collective action of all those within any given area who are willing and ready to sacrifice some of their time, means, or energy for the realisation of the Divinely inspired prayer—"Thy will be done on earth as it is in heaven." This central federal body would no more interfere with the independent life and action of each of the existing churches than the Federal Council at Berne interferes with the freedom of action of Lucerne. The Civic Church, or local federal centre, round which all existing organisations, religious and humanitarian, could gather, would have nothing whatever to do with any subjects excepting those expressly delegated to it by the churches or societies whose representatives constitute its council. This spiritual counterpart of the Town Council, which will endeavour constantly to realise ideals not as yet sufficiently recognised as to be embodied in Acts

ARNOLD VON WINKELRIED.

of Parliament and entrusted to the administration of the secular authorities, I call the Civic Church. Those who constitute it can call it what they please. In Switzerland the association that comes nearest to the idea of the Civic Church is the Society for the Public Benefit—an excellent society to which we owe it, among other benefits, that the green meadow of the Oath, where the three men of Rutli swore to free their native land of the Austrian oppressor, was secured for all time as a public possession. In Brighton this association is called the Civic Centre; in Rochdale and Manchester, a Social Questions Union; in Glasgow, an Association for Improving the Condition of the People; and always and wherever a true helper exists, the members of the Helpers' Association constitute the germ of the Civic Church. For the essential and root idea of the Civic Church is, that in every community there must

be some person, if not some definite organisation, which will take trouble to look after the welfare of the whole community, as the different churches take trouble to secure the salvation of the individual souls of their respective congregations. It is astonishing how much difference there is between different communities—how much even the most advanced communities differ from each other to their own disadvantage. A town that is very public spirited in one department of public affairs, will lag lamentably behind its neighbours in other departments; and, what is still more extraordinary, will all the time be unconscious that it is behind the times.

What is wanted is a new edition of the old creeds brought up to date and adjusted to our social organism. We want a new Westminster Confession of Faith, dealing not with metaphysic and polemic, but with the actual needs of the communities in the midst of which we live

and move and have our being. We want a Normal Standard of Social Necessaries, which will be ready to hand as a handy mete-wand or measuring-stick, by which every one may gauge how far his town or district falls short of the standard that some other communities have already attained; and we want in every town or district a living centre of earnest men and women who will care for the welfare of the community as the earnest pastor cares for the souls of his flock. The function of the Civic Church is thus, as it will be seen, exceeding broad. It is not to supersede any existing organisation, but to bishop them, to organise all the progressive and righteous forces in any district so as to keep conscience in the saddle, to direct the aspirations of the community in the most promising line of progress, to keep the local authorities up to the mark and the local electorate fully informed of the moral bearings of the questions before it. Surely these are great and manifold responsibilities, which are not likely to grow less because no one is undertaking to discharge them.

I am therefore glad to inform my friends and Helpers that by the kindness of Dr. Lunn I have an opportunity of bringing the whole subject fully before the Reunion Conference at Lucerne in the month of September. On Saturday, September 9th, the whole evening will be devoted to the consideration of the question, when I hope we shall have representatives present from the various Civic Centres in England and Scotland and also from the Society for the Public Benefit in Switzerland. Saturday night will be devoted chiefly to a description of the work that has already been actually accomplished in the formation of Civic Centres, and a record of experiences which may be helpful to others. On Sunday afternoon, we shall, weather permitting, hold a camp meeting under the trees on the mountain side, when the subject will be the aspiration how best to unite all the existing agencies which have been formed or are being formed

WOODEN BRIDGE, LUCERNE.

for bringing about the salvation of the community. On Monday evening the concluding meeting of the Conference will be given up to the same question.

I hope that there may be a goodly muster of Helpers and sympathisers at Lucerne on September 9th. The Helpers' Association and the Civic Church movement might receive a great fresh impetus from the Conference if it is adequately attended and the subject is properly presented. My wife and I hope to be at Lucerne, all being well, on September 3rd—Cromwell's Day—and will be delighted to see as many of our friends and Helpers as may be able to spend a week on the most beautiful of the Swiss lakes in the promotion of one of the most fascinating of all causes.

THE UNFAITHFUL GUARDIANS AND THEIR LADIES' COMMITTEE.

"I found the Workhouse (at Buckingham) in a dirty, untidy, and discreditable condition."—Mr. MURRAY BROWN, H.M. Inspector, 1893.

THE Workhouse at Buckingham may have been discreditable, but it is less discreditable than the Board of Guardians, whose infidelity to its duty is thus exposed by the Inspector of the Local Government Board. For the Guardians, of Buckingham have been guilty of the indescribable folly of first making their workhouse a disgrace to the county, and then of making a public exhibition of their own pride, prejudice, and stupidity, by resenting the sensible and practical advice of the Ladies' Committee, which they themselves appointed to look after the work they had shown themselves utterly incompetent to perform.

The Ladies' Committee, of which Miss Holland, one of my Helpers, was the Hon. Sec., were no sooner appointed than they set to work in a businesslike fashion. After three months' careful study of the workhouse, they drew up a report, which the Guardians refused to consider, but the gist of which I publish, in order that other parts of the country may know the shame of Buckingham, and that reformers everywhere may be encouraged to press for the appointment of Ladies' Committees, to whom it is evident we must look for the practical improvement of our poor law administration.

It is a disgrace to England that such a state of things as is revealed by this Report should have been allowed to exist, and it is a still greater disgrace that, instead of being humiliated by this exposure of the inhumanities perpetrated under their authority, the Guardians—all of whom are men, and one of whom is a clergyman—cashed the Ladies' Committee. They will have no more meddling women in Bucks Union to suggest that paupers should have screens before them when they die, and pocket handkerchiefs and nightshirts. "Good heavens!" cries the Bumble of Bucks, "what are we coming to?" Poor Bumble! what he has come to is very obvious, as he is himself beginning to discover somewhat tardily. Here, however, is the Report:—

Being aware that you are about to appoint an assistant matron, we earnestly hope that you will choose some one that is experienced in nursing. We consider the matron has already so much to do in the way of general management that it is important she should have efficient help given to her in nursing the sick and infirm.

We also beg to call your attention to the death of two women named Marks and Jones. We do not consider sufficient attention was bestowed upon their latter hours; that no screen was placed around their beds; and that in the case of Caroline Jones medical aid was not given to her for four days after her last seizure. We venture to say that had either of the women been in homes of their own, however poor, they would have had more attention. We think that a screen should at once be provided, and that orders should be given for its use when persons have to be washed in bed, in severe illness or approaching death.

The illustrations in this article are taken by permission from the sumptuous volume, "Switzerland," Poetical and Pictorial, a collection of poems by English and American poets compiled by Henry Eberli, with eighty-seven illustrations. Mr. Eberli was an old Helper of ours when he was in England, and I am delighted to see this evidence of his devotion to England and to Switzerland. The book is published at Zurich, but my publisher, Mr. Marshall, 125, Fleet Street, E.C., will be very glad to receive orders for it. The book, which is bound in cloth, half gilt, and contains over five hundred pages, is published at 10s.

We also wish to call your attention to the lack of garments for the use of the sick and infirm people when compelled to get out of bed. We find in other Workhouses inexpensive garments are provided. Your Committee will be pleased to assist the Matron in the cutting and making of such garments, should you give the necessary sanction for the same.

We also think that a small bed towel should be provided for the use of those persons who have to take their meals in bed. It would add much to their comfort and cleanliness.

We also find that pocket handkerchiefs are not allowed to the inmates. We feel that in regard to cleanliness this is an error. We would suggest that handkerchiefs be purchased, and that at least one per week be given to each inmate.

We would next suggest that the scrubbing of the stone floors, staircases, and passages be relegated to the men. This would enable the women to devote time to laundry and needlework.

We think that the porter might assist or superintend this work, and also that he should be requested to keep his present pantry (which we note you purpose removing) in a better and cleaner condition, and that he be requested not to cut the bread for the inmates more than one hour prior to the serving of the same.

We also wish to call your attention to the girls and young children in the House. The present care-taker of the youngest children (F. Cross) we consider to be mentally incapable of the work, and that a more efficient person should be appointed at once. We also consider that a day-room similar to the one now occupied by the boys should be arranged for the girls and young children. The stone floor, bare walls, and generally dreary aspect of the room now used by them, and the entire absence of home life, is deleterious in view of their future lives.

We note your refusal to allow us to visit the sick and infirm men. We much regret this, as we find it is done in other Workhouses. In view of this refusal being continued, we respectfully ask you, who is to visit them? Surely they need cheering as much as the women.

We also beg to call your attention to the diet now given to the sick and infirm women and children. We are astonished to see the amount of food that is daily left. We do not consider this to be because a surfeit of food is given to them. We venture to say it is because it is not suitable. (1st) It is never varied; (2nd) It is not served in a way to commend itself to those not in robust health.

We would suggest that a thorough alteration be made in the diet, subject to the approval of the Local Government Board and the Medical Officer. We should also like to suggest that the bread now left be made into puddings and given to the children for supper. As housekeepers, we can vouch for the economy of these puddings, and that they are always eaten with relish.

We feel that the question of a change of diet requires much thought, and we would suggest that with a view to this you should appoint four Members of the Board to meet your Medical Officer for the House and ourselves to thoroughly discuss the same, all resolutions to be then placed before you.

There is one thing upon which we should like to have a very clear understanding, viz.: Is it necessary that we should always be accompanied by an official when visiting the inmates?

THE WASTED WEALTH OF KING DEMOS.

IV.—HIS ARISTOCRACY. A PLEA FOR AN OLD ENGLAND PARTY.

A SENSE of the immensity of the wasted wealth of King Demos grows upon the mind. I have already described his Unoccupied Mansions, his Patrols eager for fresh service, and his treasure of past Glories. This month I have to describe a different class of wasted wealth, not less precious and not less capable of reclamation than any of the others—to wit, the Aristocracy of the land. Here is treasure trove indeed, which everyone has hitherto recognised as being capable of destruction by King Demos, but comparatively few have recognised as being capable of being exploited for his needs.

The present moment is propitious for proclaiming the fact, for already the air is rent with the discordant notes of the Liberal wind instruments as the expert practitioners are tuning up for the purpose of sounding once more in the ears of the British people the stirring slogan of "Down with the House of Lords!" For these astute and sanguine performers are destined to a great and a grievous disappointment. The English people are not exactly in a mood to rise in their might and go on the war-path to take the scalps of the House of Lords, merely because that body, acting in accord with the majority of the English electors and the majority of the English Members of the House of Commons, asks that the latest revised version of the Home Rule Bill should be submitted to the constituencies before the Bill is finally forced upon the Constitution by a majority varying from fifteen to fifty Irish votes.

THE OLD TURK'S HEAD.

The House of Lords has long and deservedly been the favourite Turk's head of the popular party in England. For sixty years and more they have constantly set at defiance the wishes of the voting majority of the English constituencies, and as constantly it has been the natural and necessary resource of the popular party to get up the steam for a General Election by denouncing the selfish obstruction of a handful of interested and headstrong aristocrats. But this year, when almost for the first time in the life of this generation the veto of the Peers has been bespoken in advance by a majority of the English electors, the attempt to send round the fiery cross is worse than an anachronism—it is idiotcy.

But it is not of the British aristocracy entrenched in the Gilded Chamber that I speak when I invite King Demos to regard them as a portion of his wasted wealth. There is little or no wealth for Demos in the hereditary House, although there is no saying what may yet be discovered there if the Commons proceed much further in the fatally facile path of closing debate before it has begun by the guillotine, which thrusts whole clauses holus bolus through the division lobby, without even so much as the formality of a word being said in explanation or defence. But there is an infinite store of wealth for Demos in the peers themselves, in their ancestral position and in their ancestral possessions, and to this subject I now address myself without delay.

FROM THE ENEMY'S CAMP.

It is rather odd that I, of all men, should have to point out the possibility of utilising the English noble in the service of the democracy. For I was brought up in the strictest sect of the Radical Republicans. My father, before he went to college to prepare for the Congregational

ministry, served his apprenticeship as a cutler at a Sheffield forge, in the dark and evil days when the Cutlers' Union, a Vehmgericht enforcing its decrees by rattening and murder, had not yet developed into the modern Trades' Union. Ebenezer Elliott, the Corn Law rhymist, with his passionate impeachment of the lords of the soil who made dear the bread of the poor, gave poetic expression to the deep inner conviction of every north-country Radical, who to this day, in their heart of hearts, believe that it will never be well with England until she is rid of the Lords. Many a time and oft I heard my father remark, when I was a boy at his knee, that it would be a blessed day for England if the whole British aristocracy could be placed on board a ship and sunk in mid-Atlantic—a variant from the usual prescription for healing the woes of Ireland, which might perhaps have been equally efficacious. Reared with such traditions, it was inevitable that I should have thrown myself heart and soul into the two recent campaigns against the House of Lords which took place when they mutilated the Irish Land Act and resisted the enfranchisement of the county householder. My "Fifty Years of the House of Lords," which was circulated by the hundred thousand, is an impeachment of the Upper Chamber, which is all the more unanswerable because it is based entirely upon their own acts and deeds. It is therefore a somewhat strange irony of fate that I should now have to take the initiative in appealing to the peers to grasp the opportunity of their great position, and in pointing out to King Demos the immense possibilities of good that are latent in the historic peerage of Britain.

A PRACTICAL SECOND BEST.

My antecedents are at least a sufficient guarantee for the fact that I have not approached the consideration of the subject with any lurking prejudice in favour of the peers. The same simple but inexorable logic that led me to make my pilgrimage to the Vatican, leads me to publish this article about the Peers. I am of a practical turn of mind, and all means seem to me important only so far as they lead to the end. My father's prescription of the Atlantic may have been the best solution of the problem of the House of Lords. But as there exists no power capable of conducting our peers across the gangway of the ship destined to be scuttled in mid-ocean, we must fall back on second bests. After having done your level best to destroy your enemy, and having failed, the next thing to do is to see if you cannot make terms with him, so as to exploit him and his for the good cause. As long as there is even an off-chance of exterminating your adversary you naturally refuse to treat, but when it is quite palpable that he refuses to be exterminated, at least in your lifetime, men of a practical turn of mind reconsider their position and ask whether or not they can more easily attain their end by adopting a less unpromising policy.

SURVIVAL AS AN ARGUMENT.

Side by side with this argument there operates another, and that is a respect for that which has been and that which still is, not because of any particular reverence for age as such, and certainly not from any reluctance to reform anything to any extent where reform is needed,

but because there is a strong presumption that there must be much saving salt in an institution which keeps its savour for centuries and for millenniums. The barque that has weathered a thousand storms and still rides triumphant on the waves, has given proof of the soundness of her timbers and the fidelity of her workmanship, which we cannot have in the newer craft that are spick and span. The time may have come for sending her to the ship knacker; it may be absurd to propose to fit the old sailing ship with boilers and patent compound engines and double screws, and the attempt to put new wine into old bottles is not always to be commended—at least if you put too much new wine into too old a bottle. But there has been a *raison d'être* for all things, even for the Turkish Empire and Mrs. Grundy, and if you cannot get rid of them, you must e'en make the best of them, or they will make the worst of you. As it is with the Pachas, so even my most intransigent of Radicals may admit it may be with the peers. Failing the Gladstonian bag and baggage prescription, which might be excellent if it only could be administered, what do you propose to do with the British aristocracy?

THE PARLOUS POSITION OF THE PEER.

The peer is for the most part a poor creature, and one greatly to be commiserated by the benevolent. For nearly a hundred years he has been the favourite cockshy of every popular demagogue. Even to this day the Home Ruler's great hope is that when all other chances fail he may get a rise out of the peers by ingeniously combining the cry of Home Rule with "Down with the House of Lords!" The peers have lost heart in themselves; they have lost faith in their order; they are almost afraid to ask for leave to live. Radicalism has insulted them, Demos has humiliated them, it has become an article of faith with half the nation that they are enemies of the people, and the whole trend of modern democracy threatens to leave them stranded high and dry, hopeless anachronisms which can ask for nothing more than to be gracefully and painlessly put out of existence. What with being bullied by the Liberal party and being used as catspaws by the Tory party, alternately to defend and to betray the institutions which they most prize, the position of a peer is not enviable. The relative importance of England compared with the rest of the English-speaking world shrinks daily, and nowhere outside these islands is a hereditary peerage to be found among English-speaking men. The British noble, like the bulls of Chillingham or the ruins of Kenilworth Castle, is a curiosity with a very narrow habitat. You can find him within these four seas and nowhere else in the whole world. This, although increasing his value as a curio, cannot be said to give him the old consciousness of his right to swagger in the foretop of the State in directing the destinies of the English-speaking race.

HIS LAST CHANCE.

But in these late days, if the peer but knew it, there has been a diversion of the hostile forces which pressed him hard. For the last forty years, the middle class, with the purse of capitalism at its back, made war upon the aristocracy. The Free Traders have smitten the great landlords a mortal blow; their rents have dwindled, and are dwindling still, to zero. Prosperous ironmasters or American capitalists sit in the palaces of our nobles, and even Quarter Sessions have been abolished by the Conservatives themselves. But even now, when the pride of the peer is humbled in the dust, and his enemy exulteth over him continually, the tide of war has rolled from his castle gates and is now beginning to assail the

fortresses of his ancient adversaries. Modern Socialism strikes not at the peer so much as at the capitalist. It is a protest against the unearned increment of mere wealth acquired without effort, and spent without any sense of the stewardship of money. It is aimed far more directly at the employer of labour and the stockholder, at the trading capitalist and the banker, than at the landlord—at least at the landlord of agricultural land. The peer has thus obtained a respite. When the forces of social democracy are assailing what the Americans call the gold bug, the peer, if he did but know it, has an opportunity of reasserting himself which may never occur again in his history.

RESPISED—AND WHY?

For it is a simple fact, which anyone can verify who cares to ask any of his friends among the peers, that the stewardship of money is recognised much more systematically even by the average landlord than by any but the most philanthropic capitalist. Take, for instance, the case of two men, each with a million sterling in their hand to invest; one buys a great estate with a historic seat, the other buys consols. They may be both men of average philanthropy, but at the end of the year the owner of consols will have received £25,000 net, of which, if he is very generous, he may distribute £5,000 in charity or in works of piety, whereas the purchaser of the landed estate would count himself very lucky if he could reckon upon receiving £10,000, the whole of the remaining £15,000 being as it were automatically distributed in benefactions, subsidies, rates, expenses of maintaining what is virtually the county museum and the county park and other expenditure, the chief and sometimes the whole advantage of which is reaped by his poorer neighbours.

The charges with which custom, tradition, and the law have saddled the landowner are, at least, twice and often ten times as great as those which press upon the holder of consols. Hence the predatory Socialist, who is going about seeking whom he can devour, finds much more to attract him in the middle class capitalist than in the aristocratic landowner.

THE TIMIDITY OF ANACHRONISMS.

The peers are, however, such feeble folk, and so afraid to call their souls their own, that they seldom venture to dwell on this fact even to themselves, and they never dare to tell the truth to Demos. What a difference there is between people who feel they have a right recognised by public opinion and the movement of the times to do what they want to do, and those who are painfully conscious of their being anachronisms who are merely suffered to survive! Take, for instance, the contrast between the Chief Constables and the peers. In the olden days when the feudal system took root and flourished on English soil, the peer was as conscious of the natural necessity for his existence as our Chief Constables are to-day. They were, indeed, in those days constantly discharging the duty of Chief Constable in their respective domains. But nowadays while the Chief Constable is everywhere hungry for more work, confident of his ability to do it, eager not to lose any and every chance of magnifying his office for the service of the community, the peer, nervous and timorous, never dares to propose when we are reshaping English institutions that any new powers should be entrusted to him, or that any fresh responsibilities should be fitted upon his shoulders. It is the old story of the Land League and the Castle Government of Ireland. The Castle Government is so conscious that its existence is contrary to modern ideas that it is

afraid to shoot even when it knows that it is right; the Land League was so certain that it was the real representative of Ireland that it did not hesitate to kill even when it was not sure whether it was in the wrong.

THE LATE LORD CARNARVON.

The peer whom I knew best and loved most was the late Lord Carnarvon. A fine and noble soul, full of natural piety and of quiet invincible courage, he never was rightly appreciated by his contemporaries. He did his duty and did it nobly, but no man could have been more saturated through and through with the conviction that it was all of no use, that the Destinies had decreed that England should fall a prey to the demagogue and the democrat, and that soon all this famous and stately remnant of the old English nobility would be but as the wreckage that strews the beach after the vessel has foundered in the storm. Yet, notwithstanding that deep, disheartening conviction, Lord Carnarvon fought on, never faltering in his struggle for what he considered the rights of his order and the interest of his class, with which, in his opinion, were inextricably bound up the welfare of Britain and the very existence of the Empire. I refer to him as the prominent example in our time of the peer who, though no craven, never had heart to hope, and who, while fighting on with indomitable spirit, never believed it was possible that the shadow would go back on the dial of Ahaz, or that the English nobles would ever again be welcomed to their old place in the guidance and governance of the English world.

WITHOUT FAITH NO SALVATION.

Therein he was mistaken. The English noble has still before him a career as brilliant as that of the peers who signed the Magna Charta or who conquered France at Agincourt and Crecy. He may, if he has it in him, still rule England, under other forms, no doubt, but not less really and truly than his ancestors ruled it in the days of the Plantagenets and the Tudors. Feudalism is dead, no doubt, and the arrogance of caste which it engendered. But the English noble may yet become the leader and chief of the democratic masses, and command, amid the plaudits of an admiring and grateful people, the homage due to one who acts up to the great principle of *noblesse oblige*. But it is necessary, first of all, for the peer, as for the commoner, to have faith in himself and faith in his cause. At present he has neither. He despairs; and to the despondent there is no sunrise of success. If they do not believe in themselves who know themselves, how can they expect us to believe in them who know them not? Without faith there is no salvation for soul or for aristocracy.

POSSIBILITIES BEFORE THE PEERS.

I do not propose to waste time on the House of Lords. It is the only relic of feudalism which excites popular discontent. As the Church would be stronger if disestablished, so the peers would be infinitely more powerful if they dissolved the Upper Chamber. But of that I need not speak in this connection. Nor do I wish to insist upon a readiness to sacrifice the hereditary House as a condition precedent to beginning their new career under democratic auspices. It follows no doubt as a corollary from the principle "Let not your good be evil spoken of," but it is not essential to our main position.

That position is briefly this. That in England at this present time there is absolutely nothing to hinder any English noble who is worth his salt being installed by popular acclamation as veritable ruler of any of our

English shires—if only he will take the trouble to help the people instead of spending his time in amusing himself and friends of his own caste. If, as in olden times, they will live for the people, the people will be only too willing to die for them. We are face to face in their case with an abdication of influence, as a result of the loss of power that is as discreditable as it is unusual. Yet, notwithstanding all their sulks and all their frivolity, our nobles could still rule us if they pleased to take their functions seriously, and perform their duties with a due sense that to be a leader a man must not be a despot, and that to rule a people one must know their needs and understand their wants.

A NEW INNINGS, AND ITS CONDITION.

I have recently returned from a short cycling tour in France. There the châteaux are empty or in ruins. The noblesse is impotent or non-existent. Where its shadow lingers it is fiercely assailed by the envy of a democracy of which it cannot be said, even by its bitterest enemies, that "it dearly loves a lord." Everywhere the contrast was most marked. In France the noble has had his last innings, and can play no more. In England he may still, if he pleases, go to the wicket and prolong the game, and make as good a score as ever his ancestors did in the past. But to do this he must play the rules of the game and obey King Demos, even when he proposes to guide his steps.

THE POPULARITY OF THE PEER.

Mr. Labouchere is said to have declared, in his dry humorous way, that he would never consent to abolish the House of Lords, because he could not hope to hold his own if a duke were to come out against him as Tory candidate at Northampton. Mr. Labouchere is right. Even now, with all the prejudice against the Oligarchical Chamber, which naturally results from its insensate opposition to the needs and wishes of the nation, if it were destroyed to-morrow, oligarchs would be at a premium in all the most democratic constituencies in Great Britain. There can be no better test than this of the permanent ingrained respect which the ordinary Englishman has for the noble. It is idle saying that it is all snobbery. Snobbery itself has to be explained, and the English Radical wirepuller's craving to have a candidate with a handle to his name arises from the fact that men with titles have done good service for the people.

THE TRADITION OF SERVICE.

Our nobles have still the tradition of service. A few conspicuous examples which seem to discredit their order are in reality conspicuous because of their contrast to the general average. Take a peer with an income of £20,000 and an ordinary financial magnate with a similar revenue, and you will find that the former usually does twenty times as much unpaid work for the community as the latter. In many cases the unpaid work which peers do for their fellow-men is almost incredible.

Talking over this subject the other day with the Earl of Meath, he told me an anecdote illustrating its truth which I take the liberty of repeating here. Lord Meath said that the Duke of Westminster was one of the peers who were literally weighed down by an ever-present sense of their obligations to the community. "Some short time ago," said Lord Meath, "I spent a delightful afternoon wandering through the beauties of Cliveden—the place which the Duke of Westminster recently sold to Mr. Astor for £300,000. Shortly after, I had occasion to call upon the Duke to ask him to take the chair at some public meeting in which I was interested. The Duke

looked over his engagement book and said he was very sorry he had not a spare afternoon. 'But,' I replied, 'I don't want it immediately; any time this season will do.' The Duke answered, 'But I have no spare afternoon the whole season. I have every day filled up with public engagements of one kind or the other.' I said, half wonderingly, 'Do you really mean to say that every day during the whole of this season you have an engagement of a public nature, and you have not a single day left for yourself?' Then the Duke, somewhat apologetically, turning over the leaves of his note-book, said, 'I beg your pardon, I find I have one day I had reserved for myself which has no public engagement. You can have that if you like. You see,' he added somewhat plaintively, 'I had reserved that day in order to see Cliveden. If I had not done so I should have no chance of visiting it this year.'" Lord Meath said, "Of course, I assured the Duke that on no consideration would I deprive him of his one solitary day, and I left marvelling at the amount of public work which is thus unobtrusively discharged." It would be interesting to know how many holders of consols and other scrip devote even so much as one afternoon a month to the furtherance of other people's welfare than their own.

RENT AS RULERS' WAGES.

The Duke of Westminster's engagements are no doubt as exceptional as his revenue. But most noblemen are more or less in the same position of closely-watched slavery—dignified by the name of power. The old idea, no doubt, of the lands settled on the feudal barons, was that they should in return do the governing of the region that paid them rent. It would be interesting to know how many of our peers, after these long lean years of low prices and of agricultural depression, have any rent at all after meeting the various charges of the estate, rates, maintenance, etc. The case of Irish peers is perhaps exceptional. "What do you think," said an Irish noble to me one day, "I draw from my Irish estates? I cannot afford to live on them. That would be too extravagant. I let the Castle, and what do you think my net annual revenue is?" Of course I could not say, but surmised that it was small. "Small!" he rejoined; "it is a minus quantity. I not only receive nothing, but I have absolutely to subsidise it to the extent of £2,000 a year from my wife's private income!" Another well-known peer, who is universally respected and deservedly popular, told me the other day that he had estates in four counties, from only one of which did he draw any net revenue; it was the one estate where he had not a residence. The cost of maintaining the great baronial keeps or the modern castellated palace—even if, as in the case of the Duke of Westminster, you never can find time to visit it—is enormous. When they are rated at anything like their actual value they become so many white elephants, and are now rapidly passing into the hands of Americans and Jews.

THE OBLIGATIONS OF THE PEERS.

The noble is the hereditary custodian of the art treasures of his county. He has its only picture gallery under his charge, and its museum of historical antiquities. Sometimes he has a costly library to keep; almost always he has to maintain the only park and gardens, which afford object lessons to the country-side in horticulture, arboriculture, and landscape gardening. He often owns the only edifice in the shire with any architectural pretensions, and he has to subscribe to every church, every school, and every town hall on his domain. He is often lord-lieutenant, always a magistrate, and often a member

of the County Council. At every turn he is confronted by a public duty, or reminded of some social obligation. Many nobles do their work badly, but none of them are ever permitted to forget that it lies at their door waiting to be done. If they do it in a fashion more or less perfunctorily, still it is because they do it, and have gone on generation after generation doing it, that they continue to this day as a permanent element in English society.

THE CHANCES OF A PEER.

No one can wander through our English country side without being impressed by the enormous stock-in-trade which the British noble has at his command if, discarding the adventitious and unpopular prerogatives of his caste, he were but to go into business on his own account. To begin with, his house is universally regarded as the natural seat of authority and of influence. Whenever he chooses to exert himself, his shortcomings are excused, and any approach towards success is hailed with gratitude and surprise. All positions of public trust and public usefulness are open to him the moment he expresses a wish to occupy them. When a mere youth, rival wirepullers fight for the honour of having him as their candidate for the county seat. Everything that other men have to spend their lives for, and attain, if at all, with an infinity of toil and trouble after the best part of their life is past, is heaped upon the young peer as if it were his natural right. To all his virtues local gossip is very kind; to all his faults a little blind. No matter how bigoted, how besotted, or how imbecile a peer may have been, his successor has no trouble in securing all the kudos, all the prestige, and all the influence which have been won by a long succession of devoted public servants.

WHAT MORE IS WANTED?

What more then, it may be asked, can you desire? Much every way. The position of the peer is one of infinite potential usefulness, but in reality in many cases how little use is made of it! What are scores, nay hundreds, of our peers doing which shows that they have the slightest sense of the immensity of the dower England has heaped upon them for having done her the honour of being born? It is true that there are some peers who make their country seats the centre of all good work, the pharos of the country side, the meeting-place of all who do anything for the shire. But how many are there whose stately residences are mere lordly pleasure houses, the home and haunt of every unworthy and sensual indulgence, the abode of gluttony and of indolence and of self-amusement—the very last place in the whole land where you would seek for a man, much less for a leader of men! Instead of a worthy ambition to live and die for England, there is little but peevish repinings at the drift of events and an insolent querulousness over the decisions of King Demos! What is wanted is that the better nobles should bring the sentiment of their caste to bear upon those who are living unworthy of their high vocations, and that there should at last be formed among the peers, especially among the younger peers, a definite party which might well be called the Old England party, that would manfully endeavour to make every English noble once more the natural chief of the people among whom his lot is cast to dwell.

THE OLD ENGLAND PARTY.

The present Duke of Rutland and others endeavoured to found a Young England party some fifty years ago, which, notwithstanding the help afforded it by Mr. Disraeli, failed to make much mark upon English social or political life. But in its essence the Young England movement aimed right, although its eye was not single,

and it was born too soon. We who live on the eve of the twentieth century can avoid its mistakes and aim more directly at the heart of things.

What, then, is the dominant principle of the proposed Old England party? Simply the old familiar principle of *noblesse oblige* applied in a new sense. The claim to overrule the will of the people by a hereditary Chamber is untenable and need not be discussed. Not in the House of Lords, but in their own houses, must the work of the Old England party be accomplished. It will have no success if the noble does not definitely put out of his head all the nonsense which leads so many to maintain an attitude of more or less resentful opposition to the advent of democracy. King Demos has set up his throne amongst us, and he has come to stay; nor will he brook much longer the insolence of subjects who, because they have handles to their names, imagine they have a divine right to dictate to him the way he shall go. Equally, of course, the peer must rid himself of all lamentations over the dear dead past, which returns no more. If he does not up and be doing, and act in the living present, he too will be added to the past and the dead, and to those things which, having died unlamented, go down to the pit with no hope of any resurrection.

LOYALTY TO KING DEMOS.

The peer who would join the Old England party must, first and foremost, accept the sovereignty of King Demos. Would that we had a pope who could compel the allegiance of our peers to the democracy, as Leo XIII. has compelled the allegiance of the French clergy to the Republic! After having thus loyally bowed to the inevitable, they can ask themselves how far they can help the new monarch to rule his realm wisely and well, and what they can do in the position in which it has pleased God to call them to make the advent of the new era more peaceful and more happy than it could possibly be if they were to hold aloof and sulk in their tents. If they honestly do these two things they can hardly use their senses for an hour without seeing that they have an unequalled opportunity of making themselves indispensable to their new Sovereign.

WHAT KING DEMOS WANTS.

King Demos wants several things. He wants to have the labourer settled on the land, so that our fields may be made as garden-like as those of Belgium and Switzerland. He wants social equality to follow on the heels of political equality. He wants all his boys and girls to have as fair a start as possible on the ladder of life. He wants his poor old veterans to be made as comfortable as possible in their closing years, and he wants to cast out the demon of ecclesiastical arrogance, and sectarian side which is fast making the State Church to stink in the nostrils of many constituencies, especially in the country districts. Now in all these things the peer can help Demos far better than Demos can help himself, and at the same time the peer helps Demos he is also helping himself.

HOW THE PEER CAN HELP DEMOS.

To begin with, it would be simply putting silver and gold into the pockets of the English nobles if they could by any manner of means contrive some method of converting their untilled acres into such gardens of plenty as those familiar to every traveller who whirls through the region devoted to the *petite culture* in middle Europe. It is a difficult thing to say how it is to be done, but it is easier for the noble to secure a common agreement among all those who are on the land, and without whom and against whom the agrarian reformer will find it impossible to do anything but mischief. Even if the

experiment fails and Hodge cannot be transformed into the little peasant proprietor of the Continent, the fact that the lord at the castle did his level best to help him to make the trial will be remembered to his credit in the great day of account.

IN DESTROYING CASTLE.

But if the peers, opportunity of dealing with the land question is one of doubt and difficulty, that is not the case with what after all is one of the most deeply-implanted instincts of the human heart—the desire for social equality. The peer can attain this, so far as it is attainable, as nobody else can. Not all the Revolutions of France have obtained for the *bourgeoisie* or the peasant the *entrée* into the exclusive drawing-rooms of the Faubourg Saint Germain. No Act of Parliament can give the village watchmaker a social equality with the village squire. But the peer who is at the head of the social pyramid can, if he pleases, work this miracle. Not, of course, in its entirety. The most revolutionary peer could not make the ablest school teacher a welcome guest on equal terms in the exclusive circles confined to the oldest county families. But without being revolutionary he can do much towards the annihilation of the hateful caste and class barriers which deface English society, especially society in the country. As M. Gambetta established the Third Republic by asserting the right of the *nouvelles couches politiques* to place and power, so the peers can keep themselves at the head of the country for an indefinite period by recognising the *nouvelles couches sociales* which are at present without their gate.

HOW IT MIGHT BE DONE.

"What then," I think I hear some peer say, "am I to invite my farrier to lunch, and dine with the scavenger?" Not at all. The service of King Demos is not hard, and his burden is light. All that the peer, who wishes to carry out this programme, has to do is to revive the old custom which gave entry to the castle to all who were doing service for the castle, substituting those who are doing service for England for the vassals who did the governing in ancient days under their over-lord. The whole social life of many an English county would be changed if instead of the noble limiting his rites of hospitality almost exclusively to the county families or to personal friends, or to the members of some smart set, he were to determine to use that hospitality as a means of bringing him into personal and living relations with all those public servants who are serving England within the radius of his influence. Why should not the peer make himself a court in his own county, to which no one should be admitted save those who were doing something for England and the country; in which the Chief Constable would have the *pas* before the idle lord, and the hospital nurse and the school teacher would be preferred before the heads of the oldest and richest county family who were doing nothing for the people? What fresh life it would infuse into the country-side if receptions were held regularly in every country seat to which the only credential that would admit was active service for the public weal! At such receptions the peer would soon discover who amongst those who flocked to his hall it would be advisable to admit to the circle of those who are invited to stay at the castle. By this means the woof of English life could be respun under the auspices and largely by the means of the English noble.

MEN WHO GOVERN ENGLAND.

The English folk who are doing the governing of the district in which the noble's castle stands are at least

some consideration at the hands of the man who the rent and is housed like a prince in their midst. The magistrates and councillors for town and county, town clerks, borough surveyors, chief constables and superintendents, medical officers, chairmen of boards of guardians, school boards, masters and matrons of workhouses, hospitals, governors of prisons, ministers of religion, and school teachers, all those who constitute the staff of the community, these should one and all be made to feel that if no one else in the county stood and appreciated their work, it was underappreciated at the castle. Here and there, indeed, there are peers who are in close personal contact with all those who are doing the governing in the districts, which formerly was conducted under

succeeds, to the Algernons there are seldom successors; and since the good duke passed away, how many persons are there in that strong and self-willed democracy which has built up the industrial, commercial, and political greatness of the north country who ever dream of looking to Alnwick for counsel, for encouragement, or for assistance? It is not that there is any hostility among the northern democracy against the Dukes of Northumberland. After many years living in the land, I can truly say I do not remember hearing an evil word spoken of the lords of Alnwick by any of those who dwell in the county from which they take their title. But even under Algernon how far short they came of realising the leadership which their predecessors had enjoyed as a natural result of their position as wardens of the Marches for the English kings!

ALNWK CASTLE, THE SEAT OF THE DUKE OF NORTHUMBERLAND.

and leadership of their ancestors; but, broadly, how many shires are there in all where the philanthropist, the reformer, the legislator, or the editor, have any realising the possibility of utilising the local noble in the service of the people?

REMINISCENCE OF NORTHUMBERLAND.

I spent almost within the shade of Alnwick Castle. In my early manhood on Tyneside, within a stone's throw of the estates of the Duke of Northumberland. One of the earliest and most intimate of friends was the Duke of Northumberland. Algernon, the late duke, was one of the best of his kind—unobtrusive, public spirited, full of philanthropy, and of the spirit of public service. He was the only person in the county of Northumberland who was not of any other person between the Tyne and the sea. But if to an Amurath an Amurath

PERCIES PAST AND PRESENT.

It is possible that the rent-roll of the Dukes of Northumberland has been greater for the last half century than the revenues drawn by the fighting statesmen versed in northern war who kept watch and ward for England against the Scot. But whereas the Percies of old were in such close, living contact with the borderers whom they had to lead to battle, that of very necessity they were compelled to interest themselves in everything which, to put it on the lowest ground, would impair the fighting efficiency of their vassals, to-day they are under no such compulsion. If perchance here and there the heir of the Percies should make the personal acquaintance of one or other of his untitled neighbours, it is merely an act of choice on his part, such as any one of us may exercise in the choosing of his friends. He is no longer the leader, keep-

ing himself in touch with those who follow him, making his personal influence thrill and burn through the very humblest of his followers. He is simply an estimable country gentleman, with a long rent-roll, discharging in more or less perfunctory fashion such amiable functions as a naturally-good disposition may lead him to undertake.

Yet there has never been a time in my memory when, if the lords of Alnwick Castle had honestly and strenuously attempted to make their dukedom an instrument of service to the democracy in the midst of which they live, they would not have been eagerly and enthusiastically welcomed. Of course, I say as an instrument of service, not if they had sought to use their power to thwart the wishes of the people. But taking the aspirations of modern democracy as I have formulated them in a previous page, what was there that they could not have done if they had but chosen to use their position, their influence, and their wealth towards making the county of Northumberland an ideal for all the other counties of England?

HOME RULE AT HOME.

That surely is no unworthy object of the ambition of the proudest peer. Yet how many are there among all the peers of historic name who will this month troop to the Gilded Chamber in order to record once more their hereditary antipathy to Irish aspirations, who have even so much as thought out what their own counties might be if they were but to attempt to realise the possibilities of their rank, and discharge the responsibilities of their station? "There shall be no Home Rule for Ireland," say their lordships, but what have they thought of the prior question—What about the Home Rule of their own domains? What have they done, or what are they doing to rule their own shires, and to help the population descended from the vassals who were proud to live, and toil, and fight, and die for their ancestors on many a hard fought field? Have they so much as taken the trouble to ascertain by personal inspection the condition of the workhouses that stud the county in which they find themselves estated in palaces furnished with all that wealth can provide or luxury can demand?

THE PEER AND THE WORKHOUSE.

Even if they have, here and there, more or less fitfully looked in upon the casual wards and the infirmaries, and the living rooms of the worn-out veterans of industry, what have they done to form any clear conception as to what has already been achieved in the way of workhouse reform by the more advanced and philanthropic unions in the country? Far be it from me to say one railing word against those peers who have dedicated themselves to the service of the people with a zeal, an industry, and an intelligence which no commoner can rival, and few can equal; but I would like to press home upon each of our English nobles that plain and simple question—What have I done to make life worth living for the old people, the helpless, and the forlorn, who crowd the workhouses in my own county? Here, surely, is a definite, simple, and obvious duty, the performance of which could excite no enmities, provoke no jealousy, and yet would deepen and strengthen the hold which our nobles have upon our people.

Is it that ambition has died out amongst them, or is it merely that half a century of rude handling has left them without even the heart of a man even to aspire to try?

THOMAS CARLYLE'S APPEAL.

I had got so far in the writing of this article when I bethought me that almost the last written words which

Thomas Carlyle addressed to the men of this generation, before he departed from amongst us, dealt with this very question. Returning to my bookshelves, I took down my copy of "Shooting Niagara and After," which may be said to contain the last political will and testament of the Chelsea philosopher, and, turning over its pages, my heart misgave me when I came to the following passage, which says so much more eloquently and forcibly everything I have been trying to say in the foregoing pages. Speaking of the English peer, Mr. Carlyle said:—

In their own domains and land territories, it is evident each of them can still, for certain years and decades, be a complete king; and may, if he strenuously try, mould and manage everything, till both his people and his dominion correspond gradually to the ideal he has formed. Refractory subjects he has the means of banishing; the relations between all classes, from the biggest farmer to the poorest orphan ploughboy, are under his control; nothing ugly or unjust or improper, but he could by degrees undertake steady war against, and manfully subdue or extirpate. Till all his domain were, through every field and homestead of it, and were maintained in continuing and being, manlike, decorous, fit, comely to the eye and to the soul of whoever wisely looked on it, or honestly lived in it. This is a beautiful ideal, which might be carried out on all sides to indefinite lengths, not in management of land only, but in thousandfold countenancing, protecting, and encouraging of human worth, and discountenancing and sternly repressing the want of ditto, wherever met with among surrounding mankind. Till the whole surroundings of a nobleman were made noble like himself; and all men should recognise that here verily was a bit of kingdom ruling "by the Grace of God" in difficult circumstances, but not in vain.

This was a way, if this were commonly adopted, of by degrees reinstating aristocracy in all the privileges, authorities, reverences and honours, it ever had in its palmiest times, under any Kaiser Barbarossa, Henry Fowler (Heinrich der Vogler), Henry Fine-Scholar (Beauclerc), or Wilhelmus Bastardus the Conqueror: this would be divine, blessed is every individual that shall manfully, all his life, solitary or in fellowship, address himself to this.

In such an independent position, acknowledged king of one's own territories, well withdrawn from the raging inanities of "politics," leaving the loud rabble and their spokesmen to consummate all that in their own sweet way, and make Anarchy again horrible, and government of real kingship the thing desirable—one fancies there might be actual scope for a kingly soul to aim at unfolding itself, at imprinting itself in all manner of beneficent arrangements and improvements of things around it.

AFTER TWENTY-SIX YEARS, WHAT RESPONSE?

It is twenty-six years since these words were written, and how much response has there been? No doubt they may have nerved many a young aristocrat to endeavour to make head against the heavy pressure of the conventional futilities in which he is cabined, cribbed, and confined. No doubt these words, or the memory of some of their many echoes, dwell in the hearts of the more earnest and faithful nobles who are striving to fulfil in some measure the ideal which Mr. Carlyle set before them; but take England through and through, of how many of the men who will rally to the support of Lord Salisbury at the coming division, can it be said that even so much as a glimmer of this ideal has shone before their eyes? Alas! I fear but very few. Still there are here and there elect souls in every order, even among the British aristocracy, and if happily they could come together so that they could stretch out helping hands to each other, if it were only in drawing up some kind of ideal normal standard of English country life towards which they would agree in concert to struggle, something of practical value might get itself accomplished.

THE TEACHING OF THE CHILDREN OF DEMOS.

Mr. Carlyle in further developing his scheme suggested that in the matter of education the services of the peers might be invaluable. This brings me to the third aspiration of King Demos which the noble might do much to realise. Demos wants his children to be educated, not necessarily in book learning, but in the faculties which God has given them, and to be trained for the work which they have got to do in this world. Here surely is a wide domain in which those upon whom England in her bounty has showered all the inestimable advantages of her universities with their endowments, and opportunities for culture which no other class possess in the whole world, could have done yeoman service for King Demos. But the first attempt to establish technical education upon any broad scale throughout our land followed immediately upon the dis-

example should be followed by the rest of their class. They might be so useful, in technical education and in elementary education, especially in the encouragement and stimulus which they might give to the whole machinery of our schools if they would but pay, let us say, as much attention to the schoolmaster as they do to their pheasants.

A VISIT TO CLUMBER.

The other day I was down at Clumber. I drove through the famous avenues, past the lake, through the ancient woods, and caught a distant view of the seat of the Dukes of Newcastle. The Duke and Duchess at Clumber are seated in almost regal magnificence in the midst of Sherwood Forest. A short time before my visit they had been entertaining royalty, but when I was there the Duke was away on one of his many tours in caravans or otherwise, and his young Duchess was lavishing her

CLUMBER, THE SEAT OF THE DUKE OF NEWCASTLE.

establishment of the peer and the country gentleman as rulers and governors in quarter sessions. Not until Demos got his County Councils established in place of Lord Lieutenants and the Justices of the Peace as the governing authorities in the counties, was he even so much as able to obtain institutions for teaching his dairy-maids how to make butter, or the house-mothers how to cook the food for their little ones.

A NECESSARY CAVEAT.

Once more let me say that nothing could be further from my wish than to ignore the excellent good work that has been done in this direction, and in many others, by individual peers. The whole drift of this article is not to contend that there are no good peers, but that the time has come to endeavour to bring up the whole body of the nobles to the level of the best of their number, and nothing could be more futile and absurd as a reply to this appeal to point out this noble or that who has done, and is doing, all that I have ventured to suggest. I pay all honour to those men and women, nor can I offer them greater homage than by pleading strenuously that their

interest upon a zoological collection of dogs which form one of the sights of Clumber. There was the throne, but the occupants—where were they?

THE DUCHESS AND THE SCHOOL MARM.

In the county of Nottingham at that very moment there were hundreds of school teachers, men and women, toiling steadily week in and week out, all the year through, at the arduous and somewhat thankless task of teaching the children who are to be the heirs of our empire something of the world into which they were born, and the faculties which Nature had given them, and the tools which they must use when they go forth into the world to subdue it. Contrast the lot of the ordinary Nottingham school marm with that of the Duchess of Newcastle. The Duchess has wealth, luxury, leisure, and support from all the country-side should she endeavour to do anything worthy of the dukedom. But who is there who has even so much as attempted to inspire her grace, all young and inexperienced as she is, with ambition to help the school teacher? The schoolmistress has, on the other hand, an ordinary salary of perhaps £2 or

£3 a week, in return for which she must spend her life buried in the streets of great manufacturing centres, diligently teaching the rudiments to shock-headed boys and girls who come day after day with their primers and their grammars to the day school. If now and then, only now and then, the teacher could feel how welcome she was at Clumber for the work she was doing, the Duchess might find it worth while to bestow a little living sympathy and attention to the toiling humans who are educating the rising generation. It would be work quite as worthy of a duchess, and, if her Grace will but believe it, not less interesting than that which at present occupies her.

HER MAJESTY'S INSPECTORS.

But without going so far down as the humble day-schoolmistress, there are the Government inspectors of factories and of schools. These inspectors are gentlemen of education. They occupy a responsible position, which in itself would mark them out for the attention of every peer who took his position seriously. Her Majesty's inspectors are struggling year in and year out with the difficulties which impede the progress of popular education in every county in England. How many of them, we wonder, are invited in their tours to the castle of the local noble, who, more than any other man in the district, could help them by a wise exercise of personal influence to overcome the obstacles which stand in the way of the education of the people? If our peers realised their position, they would consider it as a matter of course that every inspector should spend at least one night at their castle whenever he visited their shire.

A REMINISCENCE OF RABY.

I spent the first nine years of my journalistic life editing the *Northern Echo* at Darlington. Within a dozen miles of the editorial sanctum stood the stately pile of Raby Castle. Those nine years were not uneventful either in the history of England or in the history of the north country. From 1871 to 1880 the remaking of English educational machinery was practically put in hand, the system of industrial arbitration was established upon a firm footing in the coal and iron trades, and a beginning was made in many other directions of social and political progress. During these nine years I remember two occasions—and two only—in which the then Duke of Cleveland did anything to remind the country-side of the fact of his existence. He may have done other things. Of his private benefactions I say nothing. I am only speaking of the Duke as a public man, and of the impress which his existence made on the mind of a local editor, who was at least keenly alive to all influences which could be reckoned upon as factors in the local life of the district. His Grace unveiled a statue of Joseph Pease in the market-place of Darlington, and he extended hospitality to Mr. Gladstone during the time when he visited Durham in the course of the Bulgarian atrocities agitation. Both of these acts were good in themselves, but then when taken together they make but a poor show as a substitute for what the Duke might have done had he been a Duke in fact as well as in title. The habit of constructing political arguments upon philological derivations has somewhat gone out of fashion; but still the popular idea of a Duke is that he is a man born to be a leader of men. Dukes are rationed and equipped by the nation in accordance with that ancient belief. Is it not time that they endeavoured, as a class, to earn their rations?

THE FUTURE OF THE STATE CHURCH.

I now come, in the course of this hasty and incomplete survey, of the possibilities of utilising the Wasted

Aristocratic Wealth of King Demos, to a branch of the subject which ought to appeal even to those peers who are least in sympathy with modern progress. I suppose that the peers, as a body, may be regarded as members of the Anglican Church, of whose position and privileges they are the stoutest upholders. A dissenting peer is indeed a *rara avis*; but notwithstanding the alliance which makes the noble and the parson sworn allies in resisting the campaign of the Liberation Society, that campaign is not arrested. The Irish Church has gone. The Welsh Church is threatened with a suspension of its privileges. The Scotch Church is marked for disestablishment, and then will come the turn of the English Establishment.

HOW THE NOBLE MIGHT SAVE THE PARSON.

Now it may sound a strange remark from the lips of a Nonconformist and a Radical, but it is a simple fact that, if the peers can agree to take the trouble, they might save the State Church for at least another generation. The real motive which gives strength to the Liberationist Movement is not so much religious as social. The older Nonconformists fought State churches upon biblical principles, and opposed Establishments not so much on the ground of the social injustice, as because they believed their existence was contrary to the divine order. Nowadays, although Nonconformists have not repudiated the fighting faith of their ancestors, their fighting force is drawn from a very different source. As a bishop long ago lamented to me, it is chiefly due to the insane folly of the country parson. Instead of being content with the position, which not even the most acrid Nonconformist would begrudge him, of being *primus inter pares* among the ministers of religion in his parish, he insists too often upon the absurd pretension of being the only accredited herald of the Cross in his parish.

CUTTING THE COMBS OF THE COUNTRY CLERGY.

Day by day the Anglican cleric injects the subtle poison of this unchristian and anti-social venom into the veins of the English social organism. His congregation more or less take their tone from him, and church-going Dick treats chapel-going Bill as if in some peculiar and inscrutable fashion he were his social superior, and entitled to look down upon chapel folk as the pariahs of the parish. It is this poisonous and detestable spirit which works like a social gangrene into village life of England to-day. It is the "side" of the parsons in the country districts which keeps the Disestablishment agitation alive. If the Church has got to be saved, the combs of the country clergy will have to be cut.

As the Legislature has removed one after another all the offensive privileges, such as Church rates, university tests, burial monopolies, and the like, which the clergy used to regard as indispensable to the maintenance of a Christian religion, there is now little left, excepting in the social sphere, for the display of clerical arrogance and intolerance. But on the social side nothing can be done save by those who are the leaders of society. In other words, if the combs of the country clergy have to be cut, and they have to be reduced to a due recognition of their proper position as the ministers of religion, standing shoulder to shoulder with other ministers of religion, it must be done by the peers.

HOW THAT MIGHT BE DONE.

No doubt there are many clerics who would defy all the peers in Burke and Debrett to induce them to give up one tittle or one jot of the sacerdotal presumption which makes Anglicanism so often to stink in the nostrils

of rational men. But the majority are not so, and if every noble were to use social influence and prestige to condemn and punish, so far as can be socially possible, any clergyman in any parish who refused to recognise the other Christian ministers as brothers engaged in a common work, we should see a marvellous sweetening of English life in the next ten years. Nor would it be at all surprising if as the net result of such a plan of campaign against the accursed thing that the Church of England might be plucked as a brand from the burning which it is threatened by the Liberation Society.

Those who are faithful to a high ideal of citizenship, and who do not poison their Christianity with the baneful elements of class ascendancy or sectarian arrogance, should be accorded precedence, publicly and privately, over the highest placed cleric in their county who offended against the fundamental laws of good citizenship. If a peer were to do this he would produce an effect that would surprise a good many people, himself probably most of all.

WHY NOT RECOGNISE KING DEMOS?

I have thus rapidly run through the various ways in which the English nobles might be utilised, regarded from the point of view of the "Wasted Wealth of King Demos." There is nothing impracticable in any of these suggestions. They are all based upon the assumption which probably most peers are ready to accept, namely, that the peers exist, and that it is their duty if they could but utilise their order for the benefit of their country. What then should cause them to hang back? They would not do so if they could but realise the fact that King Demos has come to reign, and come to stay. No doubt, after every change in the English succession a certain number of the nobles who had espoused the cause of the defeated candidate for royal honours—whether it was the nobles who followed Richard III., or those who sided with King James—took some time before they could reconcile themselves loyally to the Tudors or the dynasty that came with the Dutch William. But after a time, when they saw that the new house had come, and come to stay, and was accepted by the nation as its rightful lord, they abandoned their prejudices and more or less sulkily enrolled themselves in the service of the king whom England had definitely chosen. As their ancestors did thus with Tudor and with Guelph, why can they not recognise as loyally the significance of the change that has been brought about in modern England by the establishment of King Demos?

HIS DYNASTY IS ESTABLISHED.

His kingdom is firmly founded amongst us; they cannot overthrow it even if they wished, although, to do them justice, it must be admitted that beyond the fractious and petulant desire of giving an occasional kick against the pricks when they are presented to them in the shape of Home Rule Bills and such like, they manifest but little disposition to attempt to thwart the ruling power. These scenic and more or less stazy demonstrations of the survival of a power that has become an anachronism, and

can only be exercised with peril both to their order and to their country, are but poor substitutes for the steady and resolute discharge of the duties which lie at their doors! Possibly it may encourage some among them who had begun to fear that the nation would resent any attempt on the part of the nobles to resume their ancient rôle in England, to hear a voice, however feeble and insignificant, raised in what they have been apt to regard as the camp of the enemy, bidding them to pluck up heart and do their duty.

THE ALTERNATIVES BEFORE THE PEERS.

Whether that may be so or not, no one who looks over the social condition of England to-day can doubt that it lies with the Peers themselves to say whether or not, in place of a gradual decay and ultimate extinction of their order, we may have to witness a period in which a revived and progressive aristocracy will loyally place at the disposal of triumphant democracy its numerous resources of culture, of influence, and of the hereditary gift of leadership. There are too many problems of great difficulty and of peril lying before our nation in the immediate future for us lightly to abandon any hope, however forlorn it may seem, that those who in times past have done nobly, and deserve well of their country, have left no descendants who are equally capable of playing the man and standing in the breach. Mr. Carlyle, in his "Shooting Niagara," seemed to imagine that penny editors, as he disdainfully called them, would resent the exercise of this local kingship to which he bade our nobles betake themselves.

A LAST WORD FROM THOMAS CARLYLE.

I remember when, not as a penny editor, but as a half-penny one, I repaired as a pilgrim to Cheyne Row and asked Mr. Carlyle what he would have me do to facilitate the coming of the new and better social order of which he had for so many years been as a prophet crying in the wilderness. Mr. Carlyle spoke very kindly and sympathetically, and bade me wait, keeping diligent note the while whenever I was able to discover any man who had sufficient insight in him to see that the existing system was impossible and could not last. Keep, as it were, a muster roll of the elect, so as to help them as far as possible to be in touch one with the other, ready for such time as opportunity might arise when they could act together, and act with effect, in carrying out those ideals of government upon which he had written so much, but which in essence are all summed up in the old phrase, *noblesse oblige*.

Fifteen years have passed since Carlyle gave me that advice, of which I have not been unmindful. Who knows but perhaps the time has come when those who look out upon affairs from what is practically Mr. Carlyle's standpoint, might not discover in the present juncture a propitious moment for attempting that realisation between the aristocracy and democracy which would be effected by the nobles utilising themselves as part of the "Wasted Wealth of King Demos"?

THE LANTERN SERVICES FOR THE SEASON 1893 4.

A SUGGESTION FOR CO-OPERATION.

I HOPE that this season the lantern may be acclimatised in many Churches where it has hitherto been a stranger. For two years past I have frequently insisted upon the advantages which would accrue if only the Churches would take up the lantern as a regular feature of their religious work. But the work has been hindered owing to the difficulty of procuring suitable slides and appropriate lectures. Many ministers have begun lantern services only to abandon them in despair, owing to the difficulty, not to say the impossibility, of finding slides or sets of slides that suited them. It is no answer to say that there are thousands of sets of excellent slides dealing with every conceivable subject always on hand for hire from the trade. That is quite true, but it is none the less true that if you who make this objection were suddenly to be summoned to deliver half-a-dozen lantern lectures suitable for such ordinary congregations as meet in our average places of worship, you would be at a loss where to turn for the slides. You cannot give "Jessica's First Prayer" as a substitute for a regular Sunday service, nor will Gustave Doré's Bible illustrations carry you very far. As a result, many who begin lantern lectures give them up after a time, while some of the more persevering take any slides that come to hand, with results which are often the reverse of edifying. Therefore, considering the experience of the past two years, I have come to the conclusion it is absolutely necessary, if the lantern service is to become as much a part and parcel of our religious work as the Sunday-school or the prayer-meeting, that we must get up and issue every winter a set of a score or more of specially prepared lectures with slides ready for the operator.

Can it be done? Yes, if my readers will help. If not, it will be difficult. But I think they will help, and that for more reasons than one. I especially appeal to ministers of religion who have used the lantern and who know from experience the difficulty which we are seeking to overcome. But I also appeal to those who are without any direct means of influencing their fellow-men—invalids, ladies, superannuated veterans, or those who are buried alive in retreats remote from their fellow-men—to help in this matter. How they can help I shall now proceed to show.

Every one is aware of the continually increasing pressure of work that accumulates upon the shoulders of every minister of religion. In large towns the parson, established or non-established, is driven almost to despair by the constant addition of fresh duties. It is about time the overdriven servant of all obtained some relief, and this I propose to secure him by the Lantern Lectures now in preparation. At present in all Nonconformist Churches, and in many Churches of the State, the first demand upon a minister's time and energy is the preparation of two sermons per week. During next winter he may be delivered from half of this bondage for half the year. He cannot preach other men's sermons. But there is no interdict upon his delivering other men's lantern lectures. Not only is there no interdict, but it will be recognised at once as a very agreeable and welcome change to have every Sunday night the discourses of leading men of all branches of Christian work illustrated by specially prepared pictures. No minister can be expected to prepare lantern slides week by week, and as the only sets of

slides in the field are prepared to illustrate other people's lectures, it becomes a matter of course that in all churches using the lantern lectures the minister will be relieved of fifty per cent. of his work of preparing sermons. Of course every minister can, and most ministers will, add some remarks of their own to those on the printed text. For that every opportunity will be afforded, and it is probable the lantern lecture will be announced as "based on the Lantern Lecture on Romance of Waldenses by Pastor Appia"—or whatever the lecture might happen to be—and no one in the congregation will know how much is his own minister's and how much the man's who wrote the original lecture.

Nor is it only overworked ministers that this series will immensely relieve. There are many churches temporarily without ministers, whose pulpits are more or less intermittently supplied. Any competent elocutionist with these lectures in his hand will be able to serve as a supply.

There is no reason, if the suggestion is taken up practically, why there should not be a thousand of these lectures delivered every Sunday night next winter all over the English-speaking land. But if we are to have twenty-four lectures each with from 40 to 50 slides, it is evident that this involves the preparation *ab initio* of from 1,000 to 1,200 slides. Apart from all other difficulties, this entails the selection of from 1,000 to 1,200 pictures, which it is permissible to reproduce as lantern slides. Perhaps one half of these may be already in existence as slides and procurable from the trade. The others have to be selected, and converted into slides. It is here where the unknown and unseen readers of the *Review* might be so helpful. Any reader who knows of the existence of any accessible picture, either painted or engraved, that would be useful as illustrating any of the subjects mentioned in the list given below, is earnestly invited to send particulars of any such picture or pictures to me at once.

If any reader has any engravings, or illustrations, or photographs, which he would be so good as to lend me for the purposes of reproduction, they will be taken great care of, and returned as soon as they have been copied. It might be a very useful Sunday afternoon exercise for the more intelligent children in any house with a good library to make a collection of pictures illustrating any of the subjects named below, or any other subject which parent or teacher might wish to suggest as a suitable theme for a lantern lecture. Publishers of engravings and artists who may be disposed to help, and at the same time to make their works more generally known, are invited to communicate with me—in preparing slides the name of the publisher would be given and the place at which the original can be obtained. Owners of slides or sets of slides illustrating the subjects selected for the first series of lantern lectures, can secure the loan of the whole series in exchange for the gift of an approved set of slides with liberty to reproduce. Amateur photographers who have negatives of views of scenes or places connected with any of the subjects in the list are invited to communicate with me. I shall also be glad of offers to make slides or to colour them.

So much for pictures. There are many readers who might help who take no notice of pictures. Anecdotes or incidents illustrative of the subjects in our text must be

familiar to many of our readers who have accumulated vast stores of reading, but who have never put them into circulation. There is something pathetic in the spectacle of a diligent reader whose head is as a miser's storehouse, chokeful of the garnered gold of lifelong accumulation, who has no means of putting it into circulation for the good of his fellow-men.

For all such persons, here is an opportunity for putting their accumulation at the disposal of their fellow-men. If you have, in the course of your reading or observation, come across any incident or fact or anecdote which would illustrate any of the subjects named below, or suggest a picture for the slide-maker, I pray you to send it in as your contribution to the Lecture Series of 1893-4.

The lectures will all be supplied with appropriate hymns on slides. They will not be supplied in the rotation of the subjoined list, but according as they are in stock.

The subscription for the complete series of twenty-four lectures, with as many sets of slides of forty to fifty per set, will be £5 5s., and subscribers for the series will have the first option in selecting slides. Any person desiring to use single sets of the series can do so, if they are in stock, for 10s. per set, with copyright lecture. Carriage both ways in all cases to be paid by hirer. Copy of lecture with list of slides will be supplied a fortnight in advance. The slides will be sent out so as to arrive on Tuesday, and should be forwarded to address of next hirer, so as to reach him on or before the following Tuesday. All original subscribers to have the use of each set for a week. Subscribers to a single set must return them after one exhibition.

The following is a list of suggested Lantern Lectures which might be produced, some of which indeed are already in hand.

1. The Way of the Cross, or Salvation by Sacrifice.
2. The Church of England and its Services to the Nation.
3. The Nonconformists and their Work. By Rev. Dr. Clifford.
4. John Wesley's Life and Gospel. By Rev. Hugh Price Hughes.
5. Emanuel Swedenborg. By the Rev. Mr. Rendall.
6. The Reunion Conferences at Grindelwald and Lucerne. By Rev. Dr. Lunn.
7. The Social Scheme of the Salvation Army. By Mr. Bramwell Booth.
8. Christianising Central Africa. By the Rev. Dr. Lindsay.
9. The Ober-Ammergau Passion Play.
10. Woman's Work in the Church. By Miss Frances Willard.
11. Joan of Arc. By W. T. Stead.
12. The Police as the Modern Knight Errant.
13. The Civic Church.
14. The Services and the Lesson of the Lifeboat. By Miss Weston.
15. The Temperance Cause. By Lady Henry Somerset.
16. The Child and the State. By Rev. Benjamin Waugh.
17. The Orphan and the Outcast. By Dr. Barnardo.
18. The Romance of the Waldenses. By Pastor Appia.
19. Heroes and Saints of To-day.
20. The Workhouse and the Poor.
21. Cromwell and the Puritans.
22. Our Ragged Scholars. By Mr. John Kirk.
23. Recreative Classes and Night Schools. By Rev. Dr. Paton.
24. How to save Sunday.
25. Christmas Resolutions.
26. The Old Year and the New.

This list may be varied, and I do not undertake to bring all or any of them out unless I secure adequate support. It is no use bringing out 1,200 slides with 25 lectures, unless I know whether or not any one will profit by the expenditure. Intending subscribers, to whom the preparation of such a set would be a benefit,

will do well, if they wish to have the lectures, to communicate with me at once. Unless I receive assurances of adequate support before September 1st, I shall not proceed further with this venture. Orders will be booked in order of receipt. All letters must be addressed—The Secretary, REVIEW OF REVIEWS Lantern Department, 18, Pall Mall East, London.

In this connection I am glad to quote the following interesting observation from the pen of our helper, Mr. Snowden Ward, of the *Practical Photographer*. He is one of our earliest helpers, who is at the present moment in the United States of America taking to himself a helpmeet in the shape of the editor of the *Amateur Photographer*. He has contributed a series of papers on amateur photography to the provincial press. The last of these appeared in July, in which he described the impetus that has been given to lantern work in the last year or two. Mr. Ward says:—

THE LANTERN IN SCHOOLS.

Following the lead, and even improving upon the example of the Yorkshire College, some schools where the teaching is more literary and historical and less scientific, make a practice of illustrating their lessons very fully. In one case an average of three hundred new slides a week is made. In dealing with such a subject as, say, the history of France under Napoleon, every effort is made to get as complete a series of slides as possible. Photographs of places, monuments, etc., historical paintings, illustrations from the best books dealing with the life of the time, and all similar objects, are freely copied by photography and shown by the lantern. The difference in result between a class thoroughly taught in this way and the same class under the very best masters working with text-books only, is something wonderful. The difference it makes to the interest and pleasure of the scholar is also very great.

I must not dwell too much on this use of the lantern, but will conclude by saying that in almost all the great London medical schools and hospitals the lantern has been recently adopted, and that all who wish for the spread of knowledge and who would lighten the task of our much-erammed scholars, should use any influence they have in the direction of securing the universal use of the lantern in teaching.

IN THE HOME.

A good lantern, conjoined with a knowledge of photography, is a source of never-failing pleasure in the home. I say this in spite of the fact that there are thousands of lanterns in lumber rooms—generally sent there because their owners have only possessed one or two sets of slides, usually coloured ones, which they showed when the lantern was new until every one was sick and tired of them.

Tight Lacing as a Cure for Consumption.

In the *Century* there is a very interesting article on "Breathing Movements as a Cure," the writer of which argues out the curious and little suspected fact, that however bad tight lacing may be for women in other respects, it is tended to secure them against consumption. His theory is that before stays were invented, the original type of breathing was abdominal. When woman took to tight lacing she practically rendered it impossible for the lower part of her lungs to extend, whereupon the higher part of her lungs set to work to make up for the deficiency; hence the extension of the apex of the woman's chest, a result that she suffers much less from consumption than man does. The writer of the article does not draw the conclusion that it would be well for man to take to stays as a prophylactic of consumption, and wisely. I would much rather take my chance of consumption than my certainty of stays.

THE BOOK OF THE MONTH.

THE STORY OF SIR RICHARD AND LADY ISABEL BURTON.*

THIS year I noticed at some length Mrs. Butler's tribute to the memory of her husband. I have now to notice a not less remarkable tribute to a not less remarkable man by a woman, who, although not on the same line as Mrs. Josephine Butler, is nevertheless a notable Englishwoman. Those two portly volumes, containing 1,200 pages of small print, constitute one part of the monument which Lady Burton is raising to the memory of her husband. Sir Richard Burton was a remarkable character; a compound, complex polyglot of a human being. He presented an individuality so marked and so unique as to be well worthy of study. But it is still more interesting to know how this strange exceptional mortal succeeded in discovering and retaining a woman ideally fitted to be his wife. She fell in love with him at first sight years before he discovered the existence of her affection; and now, when old and grey-haired, she counts it her supreme joy to proclaim to the world the manifold perfections of her deceased lord. There

is a curious resemblance between Mrs. Josephine Butler's book and that of Lady Isabel Burton—a parallel which is only brought into clearer relief by the contrast which also exists between the two women and the subject of their respective biographies. Canon Butler was a saint. Sir Richard Burton was not. Canon Butler's life was cast within the quiet closes of cathedrals, or within the walls of English educational establishments. Sir Richard Burton's was lived beneath the fierce sun of the hottest countries in the world, amid the wildest men in the savagest centres of Asiatic and African barbarism.

A PARALLEL AND A CONTRAST.

Canon Butler was a blameless and devoted clergyman of the Church of England. Sir Richard Burton was—well, it would be easier to say what he was not than to

Richard F. Burton

IN 1880.

describe what he was. But these two Englishmen were equally products of the marvellously fertile English stock, and both succeeded in securing women almost ideally fitted to be their companions in life. Of Mrs. Butler's experience I need not speak, for even this very month, as will be seen by extracts in another page, she proclaims once more the supreme felicity of her married life. Yet in her way Mrs. Butler was as full of spirit, of daring adventure, indomitable courage, and restless energy as Lady Burton. But these two women, so diverse in so many respects, are most enthusiastic idolators of their respective husbands. One of the great superstitions of society is that clever people make bad husbands or bad wives. It is a singular fact that the two biographies which of recent times have been little more than one long psalm of conjugal felicity relating to households in which commonplace mediocrity was most conspicuously absent. No woman of our century has so strongly marked a character as Mrs. Josephine Butler; no man of our time was more intensely original and absolutely unique in character than Sir Richard Burton. Here we have these two books in which we are told with almost damnable iteration of the perfect felicity which was the prevailing characteristic of their homes.

THE MOST INTERESTING OF ALL PROBLEMS.

Great as is the contrast between the two books, they are both most valuable for the light they throw upon the same problem, they are both authentic human documents recording the result of an experiment in living, which is the most perennially and universally interesting

* Life of Captain Richard Burton, K.C.M.G., F.R.G.S., by his wife, Isabel Burton. With numerous illustrations and maps. Two volumes. Chapman and Hall. 1893.

of all experiments of life. Mrs. Butler and Lady Burton are both first-class witnesses as to the success which has attended their attempts to solve one universal difficulty of the race. That difficulty which may be described more or less pedantically as the co-ordinating of two personalities of different sexes in the unit of wedlock, may be more simply expressed by the familiar formula of How do they get on with their husbands? Both for husbands and wives the answer to that question is far more important than the question as to the precise share an explorer had in discovering the sources of the Nile, or the number of campaigns waged by a general in the course of a war; for these exceptional enterprises are of necessity confined to a decimal-pointed percentage of the human race, whereas the experiences of man and woman in married life appeal to the universal heart of man. The highest and greatest of our race have the same difficulties to overcome, the same problems to solve, the same infinite number of differences small and great to compose, as those which confront the artisan, the labourer, and the scholar in the management of life. Hence for one person who will read with interest the exciting adventures of the geographer, the consul, and the explorer, there are a thousand who will feel attracted to this touching narrative by the widow of how she got on with her husband.

TWO PHASES OF THE SAME QUESTION.

In Mrs. Butler's "Life of Canon Butler" we had one side of the problem stated; in Lady Burton's "Life of Captain Burton" we have the other side. We looked to Mrs. Butler's narrative to tell us how a married life can be happy when the woman is the master mind, where the mother is also an active and weariless public worker, and where of necessity both husband and household are more or less subordinated to the wife's higher duties to the State and the Church. What we ask Lady Burton to tell us is how the problem was solved under different conditions. Lady Burton is a woman of great capacity, boundless energy, and immense force of character. But with all her gifts and graces, she was not the equal of Sir Richard Burton. He was the head, and a very masterful head to boot. Seldom has the experiment of blending two lives into one in the crucible of wedlock been tried with what appeared to be more refractory materials.

A CRUCIAL EXPERIMENT.

Sir Richard was independent, headstrong, original to the verge of eccentricity. He had gipsy blood in his veins, and with it the itch of wandering. He loved daring adventure imperilling life as some men love the wine cup. He was always doing the most reckless things, and he wrecked his career without hesitation whenever he deemed it incidental to the discharge of his duty. He was devoted to work, he toiled at his books as a galley-slave at his oar, he was a marvellous linguist, with a more or less complete mastery of twenty-nine languages; and his tastes often carried him into regions which she was forbidden to enter. She was his superior in rank, and he spent his life in what seemed to her relatives comparative poverty. She was a devout Catholic; he was one of the broadest-spirited eclectic philosophers to whom every religion contains its pearl which it is for the wise man to extract. He investigated everything, including spiritualism, although every seance brought his wife, who never flinched from following his lead, into trouble with her priests. It is difficult to formulate a problem in which, owing to the extreme strength and originality of both the personal factors, and the stormy and adventurous life that they

led, the odds seemed greater against the possibility of arriving at any tolerable equation in marriage; for to all the other difficulties and obstacles to perfect union, add this, above all, that the marriage was childless. Sir Richard Burton worshipped children, but none came to gladden his married life, and the two had to adjust their differences without that constraining influence of the presence of sons and daughters which pervades a home and steadies life with the invisible but invincible potency of atmospheric pressure.

THIS MARRIAGE NOT A FAILURE.

And yet, despite all odds, in face of all difficulties, this marriage, was a brilliant and supreme success. Even after all allowance has been made for the passion of unavailing sorrow over the departed, no one can read these fascinating volumes without feeling that the Burtons' marriage was one that vindicates the possibilities latent in that much decried institution, and that renews our faith in the true human unit which is not man or woman, but is man and woman united in a marriage of affection, and cemented by all the innumerable associations of a common life. To all households and all homes it speaks as with the inspiring note of a bugle, to encourage failing hearts to attempt once more the almost miraculous work of realising the great ideal when they shall be no longer twain but one. If the Burtons who differed so widely, who were tried so roughly, and who had no children, could yet live such a life of unity, each adding to the other the whole force and wealth of an independent and original character, why may not others not so far apart, whose life lies in pleasanter paths, and who have children, not attain to something more resembling the ideal of married life?

THE SECRET OF THE SOLUTION.

The secret of course of this miracle—for miracle true marriage, or the merging of man and woman in the new unit of two in one, is, and must always be—is an open one. The alembic which dissolved all refractory elements of life was love, passionate, faithful, devoted love, of course. Without love there can be no marriage. A loveless marriage is a contradiction in terms, like hot ice or cold fire. Where love is not, marriage is not—the true marriage of the blended life. But love alone, however passionate and noble, cannot stand the daily strain of busy life unless it brings forth fruit, not of self-indulgence and of self-pleasing, but of service and of sacrifice. And observe there must be capacity to be the helpmate. There must be character to begin with. If Lady Burton had been indolent or stupid, if she had been so weak and conventional as to be unwilling to take risks and dare danger, moral as well as physical, she might have loved her husband to distraction, but she would never have been his real wife. Still less could she have helped him to be the man he was and to do the work he did, if she had not loyally recognised his superiority, and exulted in making herself his willing and enthusiastic helpmate, even when he was pursuing a course which commended itself neither to her religious convictions nor to her own instincts.

TO WHOM IS OBEDIENCE DUE?

The old idea that the man *quâ* man must necessarily be the head of the house, and that his wife's supreme duty was to sacrifice her own life for him, is being modified by a more reasonable mode of looking at life. The question who is the head is decided by the head, not by the sex, and if the woman is wiser, nobler, greater than her husband, it ought to be the supreme glory of the latter to serve his wife, to minister to the full achievement of her life-work, and in a word to subordinate the less efficient minus to

the more efficient greater personality with which his life is linked. Canon Butler was a supreme illustration of the possibility of this solution of the problem. He was good and noble; but he was too good and too noble not to recognise that his wife in dynamic influence upon the lives and the souls of men and women was a thousandfold greater than he could ever be. So he made it his pride and glory to be a minister to that hand-maid of the Lord whose saintly fervour and sanctified passion are to-day working invisibly all over the world in the hearts and consciences of millions. But in the Burton household the case was otherwise. There what they of old time would regard as the natural order prevailed. Sir Richard Burton was a man to match whom for native force and original genius and powerful intellect it would be difficult, not to say impossible, whether among men or women. He had his faults—like all men. As was natural with one of his superb independence and great initial velocity, the natural failings of the ordinary man were magnified in him as the lantern magnifies the picture on the slide. But after all deductions are made, he remains almost immeasurably and infinitely greater even than the brilliant lady who shared his life. And as she recognised that, recognised it loyally and enthusiastically, and acted upon her convictions without swerving, her married life became a joy and a splendour unspeakable while it lasted, and a thing to be remembered with pride and gratitude after it came to an end.

LOYALTY AND LIBERTY.

It is not as if Lady Burton in her loving loyalty to her husband effaced herself, crushed her individuality, or abandoned her convictions. Had she done so, she would have been far less helpful to him. What constitutes the charm of both the Butler and Burton marriages was the way in which independence was combined with loyalty. Where the spirit of God is, says the inscription in the Old Catholic church at Lucerne, there is liberty, and as it is in the church so it is in the household. So Richard Burton never dominated over his wife; he left her perfectly free to practise her religion, to speak in public in opposition to his views, to express herself in private or in print as freely as if she were unmarried. But never for a moment was there any doubt in the mind of either as to the right of Sir Richard to decide and the duty of the wife to obey—not because one was man and the other woman, but because the direction naturally and properly belongs to the man at the helm. In Mrs. Butler's case that man was the woman. In Lady Burton's, Sir Richard had no need to quote texts for his right to rule. He was sometimes capricious, arbitrary and trying. But taken as a whole, Lady Burton would be the first to assert that it was not only her right but his duty to exercise that authority which must always be vested somewhere if anarchy and impotence are not to result. There is something of treason to the natural order, which is the law of God, when the more capable allows the less capable to rule, and when the superior intellect, with a wider outlook, allows the helm to be grasped by the inferior mind working on a narrower range. As *noblesse oblige*, so strength and wisdom and genius have their obligations, and these assuredly are not discharged by abdication in order that the less may rule the greater.

A LABOUR OF LOVE.

"I do not begin this work," writes Lady Burton, "the last important work of my life, without fear and trembling. If I can perform this sacred duty—this labour of love—well, I shall be glad indeed; but I begin it with unfeigned humility. I have never needed anyone to point out to me that my husband

was on a pedestal far above me, or anybody else in the world. I have known it from 1850 to 1893, from a young girl to an old widow, *i.e.*, for forty-three years."

And that loyal recognition of his superiority, as frank and loyal as Canon Butler's recognition of his wife's superiority, was the saving element in both marriages.

A FASCINATING VOLUME.

Lady Burton's book is one of fascinating interest. It is a page torn from the records of one of the most eventful lives of modern adventure. Its very faults are virtues. Lady Isabel's loving iteration and reiteration of her husband's transcendent abilities, her complacent reflections upon the immensity of his life's work and the mountainous mass of written matter which he left behind him, and her ill-suppressed resentment at the indifference and neglect with which he was treated by his rulers, all contribute to the lifelike realism of one of the most notable books of self-revelation that have appeared since the journal of Marie Bashkirtseff.

Not that Lady Burton at all resembles the morbid, selfish, miserable girl, whose bowdlerized journal left us so touching but so incomplete a picture of a modern woman. She is only like Marie in the frank expression of her feelings. Both Mademoiselle Marie and Lady Isabel belong to the order of the naked and unashamed. It is not difficult when you have done nothing to be ashamed of, and Lady Isabel at least has every reason to be proud of the romantic story of her lifelong devotion to her ideal man.

ISABEL ARUNDELL.

Isabel Arundell, who afterwards became Lady Isabel Burton, from her childhood up was a subject of strange experiences, which enabled her to understand better than most women the marvellously complex personality of her husband. Her life, like his, was saturated through and through with what it is the fashion nowadays to describe as the psychic element. When a mere child she almost crossed the Borderland, and sojourned for a time on the other side:—

This is what happened to me. In my younger days I had malignant typhus. I appeared to die. I was attended by two very clever doctors, who were with me at my supposed death, which they certified, and I was laid out. My mother's grief was so violent that my father judged it expedient to send for her confessor to give her some consolation. He happened to be the famous large-minded clever Jesuit and theologian, old Father Randal Lythegoe. He consoled my mother for some time, then he knelt down and prayed for me, and then he got up, and put on his stole. "What are you going to do, Father?" said my mother. "I am going to give her Extreme Unction," he said. "But you can't; she has been dead several hours." "I don't care about that," he said; "I am going to risk it." He did so, and about two hours after he was gone I opened my eyes, and gradually came to.—Vol. ii., page 414.

Of what happened during her unconsciousness as of death, she has no recollection, but all her life long she, like her husband, dwelt on the Borderland.

A DISCIPLE OF DISRAELI'S.

She was also much under the influence of Disraeli's ideas. She says:—

Although a staunch Catholic, I was an ardent disciple of Mr. Disraeli. I do not mean Mr. Disraeli as Prime Minister of England, but the author of "Tancred." I read the book as a young girl in my father's house, and it inspired me with all the ideas, and the yearning for a wild Oriental life, which I have since been able to carry out. I passed two years of my early life, when emerging from the schoolroom, in my father's garden, and the beautiful woods around us, alone with "Tancred." My family were pained and anxious about me:

thought me odd, wished I would play the piano, do worsted work, write notes, read the circulating library—in short, what is generally called improving one's mind; and I was pained because I could not. My uncle used to pat my head, and "hope for better things." I did not know it then, I do now: I was working out the problem of my future life, my after-mission. I lived in my saddle pocket throughout my Eastern life. I almost know it by heart, so that when I came to Bethany, to the Lebanon, and to Mukhtara; when I found myself in a Bedawi camp, or amongst the Maronite and Druse strongholds, or in the society of Fakredeens, nothing surprised me. I felt as if I had lived that life for years. I felt that I went to the tomb of my Redeemer in the proper spirit, and I found what I sought. The presence of God was actually felt, though invisible. The author possesses by descent a knowledge that we Northerners lack (a high privilege reserved to his Semitic blood).—Vol. i., page 534.

HER MARRIAGE FORETOLD.

The early saturation of her mind with those mystical ideas rendered it possible for her to be to Sir Richard the helpmate she became. When she was quite a young girl her marriage was predicted by a gipsy of the name of Hagar Burton, who wrote out in Romany the following notable forecast of her destiny:—

You will cross the sea, and be in the same town with your destiny, and know it not. Every obstacle will rise up against you, and such a combination of circumstances, that it will require all your courage and energy and intelligence to meet them. Your life will be like one always swimming against big waves, but God will always be with you, so you will always win. You will fix your eye on your polar star, and you will go for that without looking either right or left. *You will bear the name of our tribe, and be right proud of it. You will be as we are, but far greater than we.* Your life is all wandering, change, and adventure. One soul in two bodies, in life or death; never long apart. Show this to the man you take for your husband.—HAGAR BURTON.

Every word of this prophecy, and indeed these two volumes, are little more than the unfolding of the fulfilment of the gipsy's vision.

LOVE AT FIRST SIGHT.

She was staying with her mother at Boulogne when she met her destiny. This is how she tells the story:—

One day, when we were on the ramparts, the vision of my awakening brain came towards us. He was five feet eleven inches in height, very broad, thin and muscular; he had very dark hair, black, clearly defined sagacious eyebrows, a brown weather-beaten complexion, straight Arab features, a determined-looking mouth and chin, nearly covered by an enormous black moustache. I have since heard a clever friend say "that he had the brow of God, the jaw of a devil." But the most remarkable part of his appearance was two large black flashing eyes, with long lashes, that pierced you through and through. He had a fierce, proud, melancholy expression, and when he smiled he smiled as though it hurt him, and looked with impatient contempt at things generally. He was dressed in a black, short, shaggy coat, and shouldered a short, thick stick, as if he was on guard.

He looked at me as though he read me through and through in a moment, and started a little. I was completely magnetized, and when we had got a little distance away I turned to my sister, and whispered to her, "That man will marry me." The next day he was there again, and he followed us and chalked up, "May I speak to you?" leaving the chalk on the wall, so I took up the chalk and wrote back, "No; mother will be angry," and mother found it—and was angry: and after that we were stricter prisoners than ever. However, "destiny is stronger than custom."—Vol. i., pp. 166, 167.

As she afterwards told her mother—

The moment I saw his brigand-dare devil look, I set him up as an idol, and determined he was the only man I would ever

marry, but he never knew it until three years ago, before he went to Africa.

They met shortly after at a dance:—

My cousins gave a tea party and dance, and "the great majority" flocked in, and there was Richard like a star amongst rushlights. That was a night of nights; he waltzed with me once, and spoke to me several times, and I kept my sash where he put his arm round my waist to waltz, and my gloves. I never wore them again.—Vol. i., page 168.

He went away to Africa and elsewhere. For six years he was absent, but his image was never absent from her heart. When he came back he found her again, and then after a time he proposed.

BETROTHAL.

It came about in this wise:—

At the end of a fortnight he asked me "If I could dream of doing anything so sickly as to give up civilization, and if he could obtain the Consulate at Damascus, to go and live there." He said, "Don't give an answer now, because it will mean a very serious step for you, no less than giving up your people, and all that you are used to, and living the sort of life that Lady Hester Stanhope led. I see the capabilities in you, but you must think it over." I was so long silent from emotion—it was just as if the moon had tumbled down and said, "I thought you cried for me, so I came"—that he thought I was thinking worldly thoughts, and said, "Forgive me! I ought not to have asked so much." At last I found my voice, and said, "I don't want to think it over—I have been thinking it over for six years, ever since I first saw you at Boulogne on the ramparts. I have prayed for you every day, morning and night. I have followed all your career minutely. I have read every word you ever wrote, and I would rather have a crust and a tent with you than be Queen of all the world. And so I say now, yes, yes, yes!" I will pass over the next few minutes. Then he said, "Your people will not give you to me." I answered, "I know that, but I belong to myself—I give myself away." "That is right," he answered; "be firm, and so shall I."—Vol. i., page 250.

SIR RICHARD'S DOUBLE.

No sooner did they get engaged than the old passion for travel came upon him, and he departed without even bidding her good-bye, save *en astral*, of which she gives the following curious account:—

We had been engaged for some months. One day in October, we had passed several hours together, and he appointed to come next day at four o'clock in the afternoon. I went to bed quite happy, but I could not sleep at all. At two a.m. the door opened, and he came into my room. A current of warm air came towards my bed. He said, "Good-bye, my poor child. My time is up and I have gone, but do not grieve. I shall be back in less than three years, and I am your destiny. Good-bye."

She never saw him again for three years. During his absence she set herself diligently to work to help him. He told her after when he returned that—

All the time he had been away the greatest consolation he had had was my fortnightly journals, in letter form, to him, accompanied by all newspaper scraps and public and private information, and accounts of books, such as I knew would interest him, so that when he did get a mail, which was only in a huge batch now and then, he was as well posted up as if he were living in London.—Vol. i., p. 331.

RETURN FROM AFRICA.

When he came back he looked ghastly:—

I shall never forget Richard as he was then. He had had twenty-one attacks of fever, had been partially paralysed and partially blind. He was a mere skeleton, with brown yellow skin hanging in bags, his eyes protruding, and his lips drawn away from his teeth.—Vol. i., p. 330.

But his wretched appearance only quickened her devotion:—

Never did I feel the strength of my love as then. He returned poorer, and dispirited by official rows and every species of annoyance; but he was still, had he been ever so unsuccessful, and had every man's hand against him, my earthly god and king, and I could have knelt at his feet and worshipped him. I used to feel so proud of him; I used to like to sit and look at him, and to think, "You are mine, and there is no man on earth the least like you."—Vol. i., p. 331.

WHY SHE LOVED HIM.

The mother's objection to Capt. Burton was invincible. Her daughter, therefore, addressed her a tolerably plain-spoken letter, from which I take the following extracts. After declaring that she loved him alone, and that she would never marry any one else, she says of her beloved:—

He has had twenty-one fevers, temporary blindness, and partial paralysis of the limbs; he has come back with flying colours: but youth, health, good looks, and spirits temporarily broken up from hardships, privations, and dangers, and also many a scar. It surprises me that you should consider mine an infatuation, you who worship talent, and my father bravery and adventure, and here they are both united. Look at his military services, India and the Crimea! Look at his writings, his travels, his poetry, his languages and dialects! Now Mezzofanti is dead, he stands first in Europe; he is the best horseman, swordsman, and pistol shot. He has been presented with the gold medal, he is an F.R.G.S., and you must see in the newspapers of his glory, and fame, and public thanks, where he is called "The Crichton of the Day," one of the Paladins of the age, "the most interesting figure of the nineteenth century," the man *par excellence* of brain and pluck. . . . A master-mind like his exercises power and influence over all around him; but I love him because I find in him so much depth of feeling, and a generous heart; because, knowing him to be as brave as a lion, he is yet so gentle, of a delicate sensitive nature, and the soul of honour. I am fascinated by his manners, because they are easy, dignified, simple, and yet so original; there is such a touching forgetfulness of himself and his fame. He appears to me a something so unique and romantic. He unites the wild and daring with the true gentleman in every sense of the word, and a stamp of a man of the world of the very best sort, having seen things without the artificial atmosphere we live in, as well as within. He has even the noble faults I love in a man, if they can be so called. He is proud, fiery, satirical, ambitious; how could I help looking up to him with fear and admiration? I worship ambition. Fancy achieving a good which affects millions, making your name a national one. It is infamous the way most men in the world live and die, and are never missed, and, like us women, leave nothing but a tombstone. By ambition I mean men who have the will and power to change the face of things. I wish I were a man. If I were, I would be Richard Burton; but, being only a woman, I would be Richard Burton's wife. He has not mere brilliancy of talent, but brains that are a rock of good sense, and stern decision of character. I love him purely, passionately, and respectfully; there is no void in my heart, it is at rest for ever with him. It is part of my nature, part of myself, the basis of all my actions, part of my religion, my whole soul is absorbed in it. I have given my every feeling to him, and kept nothing back for myself or for the world. I would this moment sacrifice and leave all to follow his fortunes, even if you all cast me out, if the world tabooed me, and no compensation could be given to me for his loss. Whatever the world may condemn of lawless or strong opinions, whatever he is to the world, he is perfect to me, and I would not have him otherwise than he is.—Vol. i., p. 333-5.

BETWEEN MOTHER AND LOVER.

In response to this appeal, her mother gave her a very long and solemn lecture, telling her that Richard was not

a Christian, and had no money. As Burton used to say afterwards, her mother and she were both gifted with the noble firmness of the mule, so a state of considerable tension followed. Her mother remained obstinate; her lover insisted that she should follow the dictates of her heart, and marry him despite her mother's objections. She refused; he set off to Salt Lake City, giving her nine months to make up her mind as to what she would do. Of his determination to depart she had telepathic communication before the letter arrived announcing his decision. She went to bed and became delirious, and for six weeks struggled for life, and when she got better decided to marry him *coûte qui coûte*. As she was going to marry a poor man, and to rough it in the midst of savagery, she went to a farmhouse, where she learned every imaginable thing she might possibly want, so that if they had no servants, or if their servants mutinied, she would be able to do everything herself. At last he came back and said to her, "I have waited five years; three of those were unavoidable, owing to my absence in Africa, the last were not. Our lives are being spoiled by the unjust prejudices of your mother; choose now between your mother and me. Choose me, we marry, and I stay. Choose your mother, and I leave the country and return no more. Is your answer ready?" Miss Arundell said, "Quite; I will marry you this day three weeks, let who will say nay."

MARRIED.

Her father agreed, her mother refused; they appealed to Cardinal Wiseman, who approved of the marriage, promised his protection and a special dispensation from Rome, and said he would perform the ceremony himself. Unfortunately he took ill, and they were married by the Vicar-General. The fact of the marriage having taken place was not known to the mother for some time after, but she became quite reconciled to it in the end. What Lady Burton herself felt about her marriage may be inferred from the following extract:—

To say that I was happy would be to say nothing; a repose came over me that I had never known. I felt that it was for eternity, an immortal repose, and I was in a bewilderment of wonder at the goodness of God, who had almost worked miracles for me.—Vol. i., page 343.

After seven months of uninterrupted bliss he was appointed to a Consulateship on the West Coast of Africa. Then came an absence of sixteen long months, during which she battled for him royally at home, looking after all his business, and acting for him in all respects with the Foreign Office, Indian Office, and publishers, as if she were a veritable *alter ego*. But she could stand it no longer, and in 1863 he came back on leave, and she accompanied him to Fernando Po. Lady Burton did not remain at Fernando Po, but returned home. She had one wild spasm of jealousy concerning the chief officer of the brigade of Amazons of Dahomey, in whose army her husband was brigadier-general. The portrait of the lady in question is not calculated to inflame jealousy.

MESMERISM IN MARRIED LIFE.

After a year her husband came back, and, curiously enough, soon after his return, they chose their burial place in Mortlake Cemetery. After a tour in Ireland Burton was appointed to Brazil, and there she accompanied him, going through endless adventures, snakes and all manner of unpleasant creatures. The whole, she managed to get along extremely well. When she was in Brazil, she mentions the fact that her husband used to mesmerise her, and one

mesmerising process was that she never could keep any secrets from him. This is her account of it:—

He used to mesmerise me freely, but he never allowed anyone else, nor did I, to mesmerise me. Once mesmerised he had only to say "Talk," and I used to tell everything I knew, only I used to implore of him to forbid me to tell him other people's secrets, and as a matter of honour he did, but all my own used to come out freely; only he never took a mean advantage of what he learnt in that way, and he used laughingly to tell everybody "It is the only way to get a woman to tell you the truth." I have often told him things that I would much rather keep to myself.—Vol. i., page 451.

After leaving Brazil they were appointed to Damascus, where for some time he exercised great influence for good, which, however, brought him naturally into sharp collision with those whose influence was for evil, to wit, the Jewish gonbees men and the Turkish pashas.

SPIRITUALISM AND CHRISTIANITY.

It was when he was at Damascus that he began to study the phenomena of spiritualism. He hoped much from it, and studied it well, but he could make nothing of it as a religion; it never seemed to bring him any nearer, but he believed in it as in the light of a future frontier of science. He was impressed with the fact that Catholicism was the highest order of spiritualism, and Lady Burton gives a very extraordinary account of a Christian revival that was brought about in Damascus apparently by means of something very closely resembling the ordinary séance. A certain sect of Mohammedans called Shazlis used to assemble at nights together in the house of one of them for Moslem prayer, reading and discussion, when they became conscious of a presence amongst them which was not their own. They used to hear and see things they did not understand. This went on for two or three months before they came to an understanding. Burton heard of this through a Catholic priest, and it interested him enormously. He thought he saw his way in it to the higher kind of religion. Disguising as a Shazli he used to spend much time at their meetings, and when his priest friend was the guide pointed out to them by that spiritual presence, Burton stuck to him, and together they studied this strange revival, with the belief that there was a development something like a new advent. Unfortunately the priest died, and the Turks transported twelve of the most remarkable of the Shazlis; Burton, full of indignation, took up their cause with ardour. He told Lord Granville that there were at least twenty-five thousand Christians secretly longing for baptism, and suggested a method by which they might be protected. These Shazlis are spiritualised mystics, or Sufis.

THE SEEKING SHAZLIS OF DAMASCUS.

At the meetings where the manifestations occurred they had been praying and seeking for enlightenment before the throne of grace for two years. At length they were assured by a vision that the religion which they sought was none other than the religion of Christ. On one occasion forty of them, after an all night of prayer, fell asleep, and according to Burton, our Lord was pleased to appear to all of them separately. They awoke simultaneously, and all declared that they had seen the same vision. They were so delighted they could hardly refrain from running about the street, to proclaim that Christ was God; but they were told that if they did they would all be killed. On another night they prayed that God would give them a guide, whereupon the Priest—Burton's friend—was shown to them in a vision standing with a lighted taper in a

Christian church. He was dressed in a coarse brown serge garment, and had a long white beard. He said to them, "Those who want the Truth follow me." For three months they searched and prayed for him. At last one of them found by chance, in the Superior of the Franciscan order, the personage who had appeared to him in a dream. He gave them instructions and the number of converts rose to 250. Then the Turks fell upon them and banished them.

THE STRANGE STORY OF THE FRANCISCAN.

The following passage is from a letter written by the Franciscan father, and it embodies the result of his cross-examination of each of the converts separately.

He found them unanimous in declaring that on the first night when they witnessed an apparition they had prayed for many hours, and that slumber had overcome them, when the Saviour, Jesus Christ, appeared to them one by one. Being dazzled by the light, they were very much afraid; but one of them, taking courage, said, "Who art Thou, Lord?" He answered, "Speak." They asked, "Who art Thou, Lord?" The apparition replied, "I am the Truth, whom thou seekest. I am Jesus Christ, the Son of God." Awakening, agitated and frightened, they looked one at the other, and one took courage and spoke, the rest responding simply, "I also saw Him." Christ had once more so consoled, comforted, and exhorted them to follow His path, and they were filled with such ineffable joy, love, faith, and gratitude, that, but for His admonishing them (as He used to admonish the disciples), they could hardly restrain themselves from rushing into the streets and from openly preaching the Gospel to the Infidel City. On another occasion, the Blessed Virgin stood before them with the Child Jesus in her arms, and pointing to Him, said, three times in a clear distinct voice, "My Son, Jesus Christ, whom you see, is the Truth."

BURTON CASHIERED.

It is not surprising that the Turks persecuted them, with the result that the Christian faith spread. And if Lord Granville had energetically supported Captain Burton, instead of sacrificing him in deference to the corrupt Turkish pashas, there might have been a new era for Syria. Captain Burton thought that England might become to Syria, and therefore Syria to Western Asia, the blessing that Syria in the days of the early Church was to Europe, Asia, and all the civilised world. Instead of complying with Captain Burton's request, Lord Granville, as Lady Burton says, ruined the life of the best man in the world with a stroke of his pen. He was ignominiously dismissed at the age of fifty without a month's notice, wages, or character.

Lady Burton was in the Lebanon when the blow fell, and she received a hastily written letter of three lines to the following effect:—

"Do not be frightened; I am recalled; pay, pack, and follow at convenience."

A GUARDIAN ANGEL?

That night she could not rest, and when she heard some one call her three successive times, she jumped up in the middle of a dark night, saddled her horse, and though everybody said she was mad, and wanted to put her to bed, she rode a journey of nine hours across country by the compass, over boulders and black swamps, making for the diligence half-way hence. The diligence was just about to start when she arrived, hot, torn, and covered with dust. By this means she was able to reach Barat twenty-four hours before the steamer sailed. She

was conscious in the whole of this wild ride of the presence of an impelling force called out from herself.

I was thirty miles away from my husband, at the top of a mountain in the Anti-Lebanon, five thousand feet above sea-level, and quite out of reach of news or communication, save the three lines I received by a mounted messenger; and my difficulty was to descend the mountain in the dark, cross the country at dawn, to the probable spot where I could catch the diligence on the road. The power that moved me was therefore so much the stronger, and, as I am a Catholic, I attribute its force to my angel guardian, who is to me an *actual presence*, to whom I constantly refer during the day, and who directs everything I ask him to. When I sit with other spiritualists, they say they can see him. I can't; I only feel the power. However, I am quite sure of one thing, that nothing happens by luck or chance; but that we are moved by our good and bad angels, and that those who are in the habit of meditating or reflecting a good deal, arrive at a proficiency in knowing and understanding their calls.

After this, they were appointed to Trieste, where the rest of Burton's life was spent with occasional trips to England, and journeys abroad as far as India.

"IT."

I have no intention of making this article a biography of Sir Richard Burton, but I must refer to a very extraordinary experience which befell them in 1877, at the time when he was hoping to make a fortune by the development of the mines of Midian. Lady Burton says that for three years, from 1877 to 1880, they were constantly inundated with anonymous letters. "Private letters, papers, and writings would disappear, and, after all hope of recovery was over, they would reappear. I was surprised to find love-letters in my husband's pockets whenever I brushed his coat or dried his clothes. Fortunately, we trusted each other, and I would carry my letters to him and he would bring his to me." In 1879 Burton said to her, "I am sure that this is an intrigue, and a woman's intrigue, which has something to do with money." They used to laugh, and call the evil things which wrote these letters "It," and if they were ever going to make the smallest remark that might be unlucky they used to say, "Hush! It will hear you." Their friends thought they were alluding to an evil spirit. They were really alluding to their uncanny, fleshly, evil genius who, although they did not know it, was nestling close to them, and heard it all.

A DEATH-BED CONFESSION.

After Burton died the mystery was explained. "It" was a lady of whom we are told nothing but that her husband and her daughters moved in the higher society, and that in 1877 she passed as a most intimate friend of Lady Burton. In July, 1891, Lady Burton writes, "I was summoned to the death-bed of a lady whom I thought was a great friend of mine, who, after exacting a solemn promise not to break confidences, told me that she had been 'It.'" Her story was that she was awfully fond of money, and thought that if she could attract Burton, and alienate him from his wife, she could get as much money as she wanted. This fiend of a woman had at that time not only a husband, but a lover, and in pursuance of this design she deliberately set to work to sow seeds of dissension between the husband and wife. They never suspected her, and frequently talked with her about this mysterious "It" who wrote anonymous letters. "'I took a wicked pleasure,' she said, 'in your perfect trust in me.' She had free access to all my letters, papers and writings, and knew my every movement." She had the assistance of an expert as a forger, in copying the letters.

Such was the pitiable tale she told Lady Burton. "If God will forgive you," said the widow, "and if Richard will forgive you, then I will also. May you rest in peace. I did not trust myself to speak more," said Lady Burton. "I left the room quietly, and she eventually died."

CLOSING YEARS.

The second volume is full of pleasant gossip, concerning the people they saw, and what they did in their later life. Lady Burton mentions making the acquaintance of Madame de Novikoff at Marienbad, and says: "I here made the acquaintance of Madame Olga de Novikoff, which certainly kept me from feeling dull, for she was capital company, most amusing, and was to me the most interesting study, and a sort of life which one hears so much of, but which one in England rarely meets."

Lady Burton took her husband to see the Passion Play in 1880, and was much delighted to see the impression which it made upon him. "I can only say," she writes, "that I thank God for having been allowed to see it. What affected him immensely was Christ upon the Cross. He said, 'I never could have imagined Christ on the Cross without having seen it. It made me feel very queer.' With all Richard's cynicism, he was right glad to have seen it."

AT COUNT MATTEI'S.

Then, on another occasion, they went off to see Count Mattei. She was delighted with her visit to what was the most solid, fantastic, handsome castle possible to conceive. She regarded him as the Monte Cristo of his country. Lady Burton thinks very highly of Madame Schmidt, who is now carrying on a Mattei Hospital in London. She is most enthusiastic about Mattei's castle. She says, "Doré with a bad nightmare would be nothing to it. It was grand, bold, splendid, and reckless, but the beds were marble—æsthetic biers—with classic garlands of flowers in marble vases on marble tables; the furniture a marble bench. There were drawbridges, with bolts everywhere, the bedroom doors drawn up at night, showing black bottomless pits in the rock, into which a would-be assassin would fall. The look-out was splendid, wild, and eerie. When I saw the mad allegories on the wall in fresco, I said, 'Is it right to take medicine from such a lunatic? And yet he has cured hundreds and thousands, so I suppose I may.'"

NOTHING IN THEM?

It is interesting to note what she says as to the effect of the globules which are so much ridiculed as having nothing in them but sugar. She took six of the little globules with her first spoonful of soup, but had no sooner swallowed them than she felt that she had a small earthquake going on within her. Her husband said, "Why, it cannot be those miserable little globules. I could swallow the whole bottle." She induced him to reduce himself to six of the small infinitesimals. In a few minutes he was deadly pale and began to stagger about as I did. He said, "No more of that. These are things that ought to be under the eyes of the Count himself or of Madame Schmidt, and so neither you nor I will do that cure." Lady Burton omits to state what these globules were that produced such an extraordinary effect upon the seasoned organs of an African explorer.

LOVE THAT THINKETH NO EVIL.

One very excellent thing about Lady Burton, and that is the determination which she manifests on all occasions to think the best of her husband. His free and easy manner of talking about religion must have sorely tried her on many occasions, but she carefully treasures up every little incident that would justify her in believing that at bottom he really shared her faith.

She mentions an incident at Trieste:—

In the chapel was a large crucifix, and he would at times come in, and remain before it for half an hour together, and go away with moist, sad eyes, and sometimes look over the books or papers.

It is very interesting to notice that, as an indication of this side of Burton's character, to which his wife naturally gives such prominence, he was meditating devoting all his spare time when he came to London to work on General Booth's Social Scheme. She says:—

The last, the chief talk at dinner was about General Booth's article—the first that came out in the *Pall Mall Budget*—of "How to Relieve the Millions." He took the greatest possible interest in it, because (as he said) they could get at people that no clergyman of any church could get at, and it sounded such a sensible plan. He said to me, "When you and I get to London, and are quite free and settled, we will give all our spare time to that." This is the man who is supposed to have killed and crushed everything as he went about in triumph over the world.

BURTON'S CATHOLICISM.

And she is very indignant with his agnostic friends, who protest against her stout assertion that he was all his life a devout Catholic:—

There are people who are ready to stone me, if I will not describe Richard as being absolutely without belief in anything; yet I really cannot oblige them without being absolutely untruthful. He was a spade truth man, and he honestly used to say that he examined every religion, and picked out its pearl to practise it. He did not scoff at them, he was perfectly sincere and honest in what he said, nor did he change, but he grew. He always said, and innumerable people could come forward, if they had the courage—I could name some—to say that they have heard him declare, that at the end of all things there were only two points to stand upon, nothing and Catholicism; and many could, if they would, come forward and say, that when they asked him what religion he was, he answered Catholic.

It is also a curious fact that the people who are most vexed with me on this score are men who, before their wives, sisters, are good Protestants, and who go twice to the Protestant Church on Sundays, but who are quite scandalised if my husband should be allowed a religion, and are furious because I will not allow that Richard Burton was their Captain. No, thank you, it is not good enough: he was not, never was like any of you—nor can I see what it can possibly be to you what faith, or no faith, Richard Burton chose to die in, and why you threaten me if I speak the truth! We only know two things—the beautiful mysticism of the East, which, until I lived here, I thought was Agnosticism, and I find it is not; and calm, liberal-minded Roman Catholicism. The difference between you and Richard is—you, I mean, who married my husband—that you are not going anywhere—according to your own creed you have nowhere to go to—where he had a God and a continuation, and said he would wait for me; he is only gone a long journey, and presently I shall join him; we shall take up where we left off, and we shall be very much happier even than we have been here.

When he lay dying, she insisted upon the administration of extreme unction, and when he died, she lifted up her heart to God in fervent thanksgiving for him. "I knelt down with my broken heart, and said, 'Thy will be done,' and when I rose up I said: 'Let the world rain fire and brimstone on me now.'" So complete was her confidence and her happiness.

These volumes, it may be noted, have a very remarkable dedication, which bears testimony to her belief in this matter. The following is its text:—

TO MY HEAVENLY MASTER,

WHO IS WAITING FOR ME ON HEAVEN'S FRONTIERS.

Whilst waiting to rejoin you, I leave as a message to the world we inhabited, the record of the Life into which both our

lives were fused. Would that I could write as well as I can love, and do you that justice, that honour which you deserve! I will do my best, and then I will leave it to more brilliant pens, whose wielders will feel less and write better. Meet me soon—I await the signal!

Over his bier she said:—

There lies the best husband that ever lived, the best son, the best brother, and the truest, staunchest friend.

Nothing could exceed her idolatrous veneration for her husband:—

To the last breath there was never a saner, or a sounder, or a truer judgment in any man who walked this earth. He saw and knew all the recesses of men's minds and actions.

A HELPMATE INDEED.

The following passage was forced from her by the attacks of some enemies, who pretended that she was not a competent authority as to what Burton really thought or believed:—

Who from 1856 to 1859 kept him so supplied with daily written journals of news, of daily cuttings from the newspapers, that when he returned, people said to him, "How come you so well informed of all that has been passing just as if you had never been away, and you living beyond the pale of civilisation?" "Ah, how?" he said. By many mails he never received a line from any one but me. Who cheered him on in danger, toil, and heart-broken sickness? Who, when he came back from Tanganyika (Africa) in 1859, coldly looked upon by the Government, bullied by the India House, rejected by the Geographical Society, almost tabooed by society on account of the machinations of Captain Speke, so that he scarcely had ten friends to say good-morning to him—who sought his side to comfort him? I did! Then we married. Who for thirty years daily attended to his comforts, watched his going out and coming in, had his slippers, dressing-gown, and pipe ready for him every evening, sat sick at heart if he was an hour late, watched all night and till morning if he did not come back? Who copied and worked for and with him? Who fought for thirty years to raise his official position all she could, and wept bitter tears over his being neglected? I did. My only complaint is, that I believe he would have got infinitely more if he had asked for things himself, and not perpetually stuck me forward; but he was too modest, and I had to obey orders. Who rode or walked at his side through hunger, thirst, cold, and burning heat, with hardships, privations and danger, in all his travels? Who nursed him through seven long illnesses before his last illness, some lasting two or three months, and never left his death-bed day or night, and did everything for him? I did. Why, I was his wife, and mother, and comrade, and secretary, and aide-de-camp, and agent to him; and I was proud, happy, and glad to do it all, and never tired day or night for thirty years. I would rather have had a crust and a tent with him than be a queen elsewhere. At the moment of his death I had done all I could for the body, and then I tried to follow his soul. I am following the soul, and I shall reach it before long. There we shall never more part.—Vol. ii., page 449.

THE STORY OF "THE SCENTED GARDEN."

There is only one thing now to add to make this record of wifely devotion complete, and that illustrates and perfects the whole. When Sir Richard Burton was alive, his wife, recognising in him the superior intellect, loyally helped him, even when she disagreed with him, and never presumed to thwart his wishes or to oppose his plans. After he had published the literal translation of the "Arabian Nights Entertainment," making £16,000 by the transaction, it occurred to him that it might be a profitable business to translate a more distinctly erotic work from the Arabic. He devoted about the last six months of his life to the translation of an Oriental book called "The Scented Garden." He died before he could send it

to the printer, and, in his will, he left his wife absolute control over all his literary remains:—

"In the event of my death, I bequeath especially to my wife, Isabel Burton, every book, paper, or manuscript, to be overhauled and examined by her only, and to be dealt with entirely at her own discretion, and in the manner she thinks best, having been my sole helper for thirty years, etc., etc., etc."

(Signed)

RICHARD BURTON.

Lady Burton up to that time had not read the "Scented Garden," nor did she note the kind of work her husband had been preparing to introduce to the English public. After his death it could only be published at her own responsibility. She was offered £6,000 for the MS., but she decided that loyalty to her husband's memory, and regard for the welfare of the world, justified her in refusing the money, and consigning the MS. to the flames. Even while she did so, she attempted to persuade herself that her conduct was no reflection to her husband's memory. She says, "My husband did no wrong. He had a high purpose, and thought no evil of printing it." But that is only the fondness of a wife. Burton ought never to have translated the book, which would, as his wife saw plainly enough, simply have swelled the mass of Holywell Street literature. She even believed that she would have talked him off printing it had he lived, as she did another MS. on quite a different subject, and he knew perfectly well that if she had her will she would have burned it. Knowing that, he left her full *carte blanche* of doing as she pleased; consequently, she burned it, and she did well.

FAITHFUL TO THE LAST.

The incident brings into clear relief, however, the difference between the wife acting as her husband's

lieutenant, and the woman acting when left free on her own responsibility. A different set of conditions governing the case produced entirely different action, and it is touching to read her declarations that she burned the "Scented Garden" purely out of love "for my husband," and all the censure that was heaped upon her was as

nothing in comparison to his memory, and "our speedy reunion."

She finishes her book with:—

Do not be so hard and prosaic as to suppose that our dead cannot, in rare instances, come back, and tell us how it is with them.

"He lives and moves, he is not dead.

He does not alter nor grow strange,

His love is still around me shed,

Untouched by time, or chance, or change;

And when he walks beside me, then

As shadows seem all living men."

MARY MACLEOD.

He said always, "I am gone — pay, pack and follow."

Reader! I have paid, I have packed, I have suffered. I am waiting to join his caravan. I am waiting for a welcome sound, "THE TINKLING OF HIS CAMEL-BELL."

THE MORAL OF IT ALL.

The moral of the whole story is told in these two charming volumes, which may be commended to all wives and all husbands, and is summed up in the following passage:—

I began to feel what I have always felt since, that he was the

glorious stately ship in full sail, commanding all attention and admiration; and sometimes, if the wind drops, she still sails gallantly, and no one sees the humble little steam tug hidden at the other side, with her strong heart and faithful arms working forth, and glorying in her proud and stately ship. I think the true woman, who is married to her proper mate, recognizes the fully-performed mission, whether prosperous or not, and that no one can ever take his place for her, as an interpreter of that which is betwixt her and her Creator, to her as the shadow of God's protection here on earth.

THE MAUSOLEUM AT MORTLAKE, WHERE SIR RICHARD BURTON IS LAID AT REST.

THE NEW BOOKS OF THE MONTH.

NOTICE.—For the convenience of such of our readers as may live at a distance from a bookseller, any Book they may require, mentioned in the following List, will be forwarded post free to any part of the United Kingdom, from the Publishing Office of the REVIEW OF REVIEWS, 125, Fleet Street, on receipt of Postal Order for the published price of the Book ordered.

BIOGRAPHY.

ADAMS, CHARLES KENDALL, LL.D. *Christopher Columbus: His Life and His Work.* (Gay and Bird.) Crown 8vo. Cloth. Pp. 261. 4s. 6d.

This is a volume of the series devoted to the Makers of America. Mr. Adams, who is the president of Cornell University, says, in his preface, that he has attempted to free himself "from the thrall of uncritical admiration," and to deal with the conflicting statements as to the career of Columbus in the spirit of modern criticism and scholarship.

CARLYLE, REV. GAVIN, M.A. *A Memoir of Adolph Saphir, D.D.* (J. F. Shaw.) 8vo. Cloth. Pp. 448. 7s. 6d. With Portrait.

ERNST, W. *Memoirs of the Life of Philip Dormer, Fourth Earl of Chesterfield.* (Sonnenschein.) 8vo. Cloth. Pp. 563. 10s. 6d.

Mr. Ernst has succeeded in writing a very interesting biography, containing not a little new information. He has, as far as possible, allowed Lord Chesterfield to speak for himself, and he has been able to publish a number of valuable letters from the Newcastle papers which have not hitherto appeared. The volume contains four steel-engraved portraits and a facsimile letter.

FITZGERALD, PERCY, M.A., F.S.A. *Henry Irving: A Record of Twenty Years at the Lyceum.* (Chapman and Hall.) 8vo. Cloth. Pp. 320. 14s.

Mr. Fitzgerald intends this volume rather as a review of Mr. Irving's "artistic, laborious work at the Lyceum Theatre," than as a biography, and he has chosen the present moment for its publication, since "the pause which will follow Mr. Irving's long absence abroad seems to mark the close of an era." Mr. Fitzgerald claims to have adopted an independent tone, and he discusses many interesting theatrical questions. An excellent colotype portrait of Mr. Irving is the frontispiece of the volume.

FRASER, SIR WILLIAM, BART. *Hic et Ubique.* (Sampson Low.) Fcap. 8vo. Cloth. Pp. 317. 3s. 6d.

Sir William Fraser, whose "Words on Wellington" and "Disraeli and His Day" won him so great a reputation as a raconteur, gives us in this volume a collection of memories and anecdotes so fresh and entertaining as to make the book quite the best of its class that has lately appeared. He seems to have made a practice of jotting down any particularly good story he has heard, any interesting occurrence he has seen, and there is no page which is not thoroughly amusing. From Napoleon I. to Disraeli, from the origin of the Punch puppet-play to the introduction of Mr. W. H. Smith into political life, there seems to be few great men of whom he has not some good story to tell, so large a trifle of which he has not something interesting to say.

PRIDE, DAVID, M.A., LL.D. *Pleasant Memories of a Busy Life.* (Blackwood.) Crown 8vo. Cloth. Pp. 249. With Portrait.

On resigning the Principalship of the Edinburgh Ladies' College, Dr. Pryde was recommended literary work as a means of regaining strength, and he chose as his subject his own literary and scholastic experiences.

SABCEY, FRANCISQUE. *Recollections of Middle Life.* (Heinemann.) 8vo. Cloth. Pp. 307. 10s. 6d. With Portrait.

A very interesting volume of literary and dramatic reminiscences, translated from the French by Miss Elizabeth Luther Carey.

ESSAYS, CRITICISMS AND BELLES-LETTRES.

BLAKE, H. G. O. (Editor). *Autumn: From the Journal of Henry D. Thoreau.* (Gay and Bird.) Crown 8vo. Cloth. Pp. 470. 6s. net.

A new, admirably printed, and neatly bound edition.

BRIDGES, ROBERT. *Milton's Prosody: An Examination of the Rules of the Blank Verse in Milton's Later Poems, with an Account of the Versification of "Samson Agonistes."* (Clarendon Press, Oxford.) Crown 8vo. Cloth. Pp. 80.

Mr. Bridges here reprints with corrections a tract which he wrote five years ago on the verse of "Paradise Lost," to which he has added, from a tract published in 1889, an examination of Milton's subsequent verse. Mr. Bridges is himself a poet of such great technical skill that anything that he has to say upon the more purely mechanical side of his art cannot but be of the greatest value both to the critic and to the maker of verse. In various appendices he treats of the extrametrical syllable, elision, adjectives in *ablé*, the recession of accent, pronunciation in Milton, metrical equivalence, the use of Greek terminology, and specimens of ten-syllable verse.

HENDERSON, T. F. *Old World Scotland: Glimpses of its Modes and Manners.* (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. 263. 6s.

A collection of essays on Scottish subjects, many of which appeared in the *National Observer*. Among the most interesting is that entitled "New Light on the Darnley Murder," which is printed for the first time.

JESSOPP, AUGUSTUS, D.D. *Studies by a Recluse, in Cloister, Town, and Country.* (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. 281. 7s. 6d.

A second edition of an interesting collection of historical essays. Among the subjects of which Mr. Jessopp writes are "St. Alban and Her Historian," "Bury St. Edmunds," "On the Edge of the Norfolk Holy Land," "The Origin and Growth of English Towns," and "The Land and its Owners in Past Times."

LESTED, CHARLES T. *Studies in Life and Literature.* (Digby and Long.) Crown 8vo. Cloth. Pp. 301. 5s.

A series of short essays, interspersed with sonnets, on such general subjects as intellectual waste, poets, authors, books, modern books, knowledge, statesmen, love, envy, labour, and cookery.

MALORY, SIR THOMAS. *Morte d'Arthur.* Part I. (J. M. Dent and Co.) 4to. Paper Covers. 2s. 6d. net.

There can be no doubt that when completed this edition of Malory's superb romance will be the finest that has appeared. Admirably printed on thick paper, almost every page bears an initial by Mr. Aubrey Beardsley, the young artist whose works have already created so much interest; and there are, even in this part, many full page illustrations of extraordinary power from the same hand, which, though somewhat derivative, are of great artistic interest apart from the subject. Professor Rhys is to contribute the introduction to this edition.

RUSKIN, JOHN. *Selections from his Writings.* Second Series. 1860-1888. (George Allen.) 8vo. Cloth. Pp. 488. 6s.

The second series of "Selections from the Writings of John Ruskin" is a choice volume, printed and bound as such eloquent writing should be. The first series that was issued covered the seventeen years between 1843 and 1860; the present volume deals with Mr. Ruskin's contributions to literature from 1860 to 1888, and it was during this time that he wrote "Unto this Last," "Sesame and Lilies," "Ethics of the Dust," "The Crown of Wild Olive," "Fors (lavigera)," "On the Old Road," "Præterita," and about a score of other works. Here we have in one volume the choicest passages from all these writings carefully arranged under the titles: "Art," "Education," "Ethics," "Economy," and "Religion," and properly indexed. The book contains more intellectual life than a cart-load of others that have lately appeared.

TAINSH, EDWARD CAMPBELL. *A Study of the Works of Alfred Lord Tennyson, Poet Laureate.* (Macmillan.) Crown 8vo. Cloth. Pp. 307.

A new edition, complete and largely re-written.

TREE, HERBERT BEERBOHM. *The Imaginative Faculty.* (Elkin Mathews and John Lane.) Fcap. 8vo. Boards. Pp. 48. 2s. 6d. net.

A lecture delivered at the Royal Institution, May 26th, 1893, and now reprinted with a portrait of Mr. Tree, from a drawing by the Marchioness of Granby.

WINTER, WILLIAM. *Shadows of the Stage.* Second Series. (David Douglas, Edinburgh.) 18mo. Cloth. Pp. 367. 2s.

A collection of essays on theatrical subjects, which Mr. Winter has reprinted from the *New York Tribune* and other sources. The papers which will particularly interest English readers are those on "Ada Rehan as Rosalind," "Richard Mansfield in Several Characters," "Ada Rehan's Acting," "The Story of Adelaide Neilson," "Henry Irving and Ellen Terry in Macbeth," "Irving and C. quelin," "Willard as John Needham," "Sarah Bernhardt in Several Characters," "Cognell as Tartuffe," "Helena Modjeska," "Wilson Barrett as Young Hamlet," and "Tennyson."

FICTION.

AUTHOR OF "LADY AUDLEY'S SECRET." *All Along the River.* (Simpkin.) Three volumes. 31s. 6d.

Three score novels is a lengthy record, and it is to be hoped that the unworked brevity of this story—the third volume is made up of separate tales—and its unusual poverty of incident are not to be taken as signs of lagging pen or failing invention. "All Along the River" is the old story of a young wife betrayed, and of her repentance and confession, but Miss Bradon, although

she has invested her Cornish and Italian scenes with some charm, has been unable to give it any great new interest. The characters are superficial, and though here and there are clever passages of description and social sarcasm, the story seems to lack the care and skill which were so apparent in most of its predecessors.

AVERY, ANNE. *East Maccalls; or, Life To-Day.* (George Stoneman.) Crown 8vo. Cloth. Pp. 298. 3s. 6d.

BARR, ROBERT (Luke Sharp). *From Whose Bourne, etc.* (Chatto and Windus.) Crown 8vo. Cloth. Pp. 277. 3s. 6d.

There can be no question that two at least of these three stories are remarkably clever: "From Whose Bourne" itself is smart in its way and cleverly worked out, but it fails to impress one and has not half the snap of "One's Day's Courtship," or "Heralds of Fame." The title-story is, however, the longest, and is interesting as showing the romantic possibilities that lie ready to the novelist's hand in the realm of the borderland. It is the story of an apparent murder, but the discovery of the truth is made by no ordinary detective, but by the murdered man himself, who, anxious to clear his wife from suspicion, returns as a shadow from the spirit-world to suggest by thought transference the truth to the different people who are working at the case. Neither of the other stories is sensational; but are charming studies in the American girl, crisply written and full of humour.

BRONTË, CHARLOTTE. *Villette.* (J. M. Dent and Co.) Two volumes. Fcap. 8vo. Cloth. 5s. net.

The fifth and sixth volumes of the delightfully dainty edition of the Brontë novels that Messrs. J. M. Dent and Co. are now adding to their charming series of standard fiction. The six illustrations by Mr. H. S. Grieg are successful; and it was a happy thought to print in an appendix to each volume a free translation of the French phrases and conversations which are so abundant throughout "Villette," and which have hitherto marred the enjoyment of so many readers.

COOKE, ROSE TERRY. *Steadfast: The Story of a Saint and a Sinner.* (Sunday School Union.) Crown 8vo. Cloth. Pp. 384. 3s. 6d.

CRAWFORD, F. MARION. *Pietro Ghisleri.* (Macmillan). Three volumes. 31s. 6d.

It is another admirable story of the fashionable Roman society that he knows so well, that Mr. Marion Crawford gives us in this novel. A very complicated plot, a quite wonderful power of realising his characters, and an unusual gift of writing good conversation, have united to produce one of the best books that Mr. Crawford has written since "Zoraster." Pietro Ghisleri is one of his most sympathetic characters, and the reader is not a little glad when his troubles cease and he gains his desire in as conventional a wedding as ever completed the most ordinary novel. Refinement is, perhaps, the most pleasing quality of the story: Adèle Savelli's implacable hate, her unceasing attempts to ruin the happiness of Pietro and her cousin, are drawn with great power, but always with reticence. The death scene of Lord Herbert Arden, too, is beautifully written. One may add that Messrs. Macmillan have just added Mr. Crawford's last story, "The Three Fates," to their three-and-sixpenny series.

DOUDNEY, SARAH. *Wave upon Wave; or, Strengthened for Trial.* (Sunday School Union.) Paper Covers. 1s.

FREDERIC, HAROLD. *The Return of the O'Mahoney.* (Heinemann.) Crown 8vo. Cloth. Pp. 279. 3s. 6d.

GRANT, ROBERT. *The Reflections of a Married Man.* (Warne.) Paper Covers. 1s.

A very amusing and not at all ill-written series of chapters embodying the trivial thoughts and unimportant doings of an average happily-married father of a family. The book belongs to a class of literature which has lately become very popular, and it certainly deserves to be read and laughed over by a large number of people. It is humorous, but not extravagant; and while laughing at its incidents and characters one is not a little impressed by its realism.

GREEN, ANNA KATHARINE. *Marked "Personal."* (G. P. Putnam's Sons.) Paper Boards. Pp. 415. 2s.

The hand of the author of "The Leavenworth Case" has lost much of its cunning. There is, of course, a sensational mystery in her new story, but it is one fairly transparent to all readers of exciting fiction; and it is spun out to a quite inordinate length.

GUNTER, ARCHIBALD CLAVERING. *Miss Dividends and Baron Montes of Panama and Paris.* (Routledge.) Paper Boards. 2s. each.

The indignities to which Mr. Gunter subjects the English language are well known to every reader of "Mr. Barnes of New York." In these two new stories, his style is, if anything, worse than ever: he still writes in the present tense, and some of his phrases and sentences are quite villainous in their vulgarity. But in spite of these drawbacks both novels are very well suited for railway reading: they are exciting, and the sensational incidents, if not particularly original, are, at least, arranged with some novelty. "Miss Dividends" deals in some measure with the early Mormon community; "Baron Montes" with the Panama Canal intrigues.

HARDY, THOMAS. *A Pair of Blue Eyes and The Mayor of Casterbridge.* (Sampson Low.) Crown 8vo. Cloth. 2s. 6d. each.

The latest volumes of the very cheap and well-bound re-issue of such of Mr. Thomas Hardy's novels as Messrs. Sampson Low publish. "The Mayor of Casterbridge" is undoubtedly one of Mr. Hardy's finest stories.

HILL, HEADON. *Clues from a Detective's Camera.* (J. W. Arrowsmith, Bristol.) Paper Covers. 1s.

HOPE, ANTHONY. *A Change of Air.* (Methuen.) Crown 8vo. Cloth. Pp. 304. 6s.

Mr. Hope's last two books, "Mr. Witt's Widow" and "Sport Royal," were so clever that one turns with some anticipation to his new story. In "A Change of Air" he has got hold of an interesting plot, but his characters are so unreal that it is impossible to read the book with any great pleasure. A party of Bohemians, including a young poet of whom all England is talking, a couple of journalists, and an actress and her mother, take a country house for a year, and the story at first turns upon the results which their rather free and easy behaviour has upon the staid, conventional provincials. There is a good deal of love in the book, a suggestion of tragedy, and an attempt or two at assassination; but, on the whole, its interest is mainly of a light order. Mr. Hope can do very much better work.

HUME, FERGUS. *The Chinese Jar: A Mystery.* (Sampson Low.) Paper Covers. 1s.

A detective story which will more than sustain the bad reputation that the author of "A Mystery of a Hansom Cab" gained with all whose admiration for Gaborion, du Bolsogobey, and Dr. Conan Doyle makes them impatient of slipshod and slovenly writing and construction even in a type of fiction somewhat unjustly despised. Mr. Hume has proclaimed his desire to do good work: he showed in "The Island of Fantasy" a certain ability for the same: why then such stuff as goes to make this volume?

HUNTER, P. HAY. *Sons of the Croft.* (Oliphant.) Long Pos 8vo. Paper Covers. 1s.

IRAM, LEWIS. *Clenched Antagonisms.* (Digby and Long.) Crown 8vo. Cloth. Pp. 251. 2s. 6d.

Certain phases of the women question have seldom been treated so fully as they are in this book. We have some four central characters: May Egan, a young governess, whose good looks and unprotected position bring her continual persecution, against which she fights time after time until she is overpowered, not by argument or temptation, but by force; Esther Wynne, who gives up her life to redeem the wrong that had been done by her brother; Wallace Wynnot, to whose passion was to be traced May Egan's first sorrow; Maddison, the libertine and man of the world; and John Fan, Esther's lover, narrow and conventional, whose gospel it was that every virtuous woman should close her mind against "contaminating knowledge." In fact, in "Clenched Antagonisms" we have the whole wretched story of a girl's ruin presented faithfully and without embroidery. Evidently the work of a woman, the book is crudely but powerfully written; but the men are painted throughout in too black a hue.

LANZA, MARQUISE CLARA, AND JAMES CLARENCE HARVEY. *Scarabeus: The Story of an African Beetle.* (Cassell.) Crown 8vo. Cloth. Pp. 283. 5s.

The advantages to the writers of a certain class of sensational fiction of having read Poe's "Gold Bug" are obvious, but it is a pity that the authors of this book should have constructed a story with so many points of resemblance to that famous masterpiece. "Scarabeus" is all about a treasure buried in Africa, and two rings (the stones of which are carved in the shape of a scarabæus), which have to be placed side by side before the position of the treasure can be discovered; the story turning upon the attempts made by two very conventional villains to steal the scarabæus and forestall the rightful owners in the finding of the treasure. In spite of a generous supply of sensational incident, the tale is unexciting and an amateurish affair at best; it cannot for a moment be compared with Poe's work, and all Mr. Rider Haggard's stories—there is some resemblance in "Scarabeus" to "King Solomon's Mines"—are infinitely more interesting and better written.

LEIGHTON, DOROTHY. *As a Man is Able.* (Heinemann.) Three volumes. 31s. 6d.

In this, her first novel, Miss Leighton has come near achieving a very considerable success: she has written a story original in its central idea and striking in its characters, and if its faults are important they are the faults of the beginner and will disappear with practice. Described on its title-page as "a study in human relationships," "As a Man is Able" is another contribution to the literature of the marriage question and goes to prove the necessity for a legal marriage tie as a hindrance to man's inconstancy. A series of unlucky—and totally unconvincing—circumstances induce the young hero and heroine of the book to go to India to live as man and wife without going through the usual ceremony. A few years pass and the man finds himself wearying of his companion; and, falling in love with a young girl, who, unaware of his position, is willing to marry him, he takes advantage of his legal freedom to sever his connection with the woman who had devoted her life to his comfort. It is a pity that the story's tragic conclusion—the man's wife on learning the truth poisons herself—was not reached by some means less unlikely than the accidental meeting and subsequent friendship of the woman he had ruined and the woman he had married; but even this, and similar faults of construction, are unable to prevent the story being much above the average. For the rest, Miss Leighton has a singularly feminine style, and here and there are passages irrelevant to the progress of the story.

LEMON, IDA. A Pair of Lovers. (Smith and Elder.) Fcap. 8vo. Cloth. Pp. 265. 4s. 6d.

"The short and simple annals of the poor," Miss Lemon fitly calls her nine stories. All deal with humble life, with the trials, the sorrows and the pleasures of the very poor, and all are told with a skill and power and a sense of knowledge which make them very well worth reading. The first story, "A Pair of Lovers," is, perhaps, the most successful. It is the tale of an old couple over forty years married, but yet full of love and devotion, and is a profoundly pathetic picture. "An Artist of the Pavement" is a story in a lighter vein; and "A Glimpse of the Country" is a moving little tale of the delight of slum children on first seeing the country. Miss Lemon has evidently studied the London poor lovingly and carefully, and these short stories are as good of their kind as anything we have seen.

MELVILLE, HERMAN. Moby Dick; or, The White Whale, and White Jacket; or, The World on a Man of War. (G. P. Putnam's Sons.) Crown 8vo. Cloth. 6s. each.

It is to be hoped that this new edition of Herman Melville, of which these are the third and fourth volumes, will win for one of the most realistic and gifted writers who have ever taken the sea for their subject some of the popularity which is his due. He has in Mr. Clark Russell an enthusiastic admirer, but somehow, on this side of the Atlantic at least, he was never a very great success. Practically Herman Melville wrote only of his own experiences: he had seen all sides of naval and maritime life, had loved them all, and his works are no less remarkable for their literary brilliance than for their absorbing interest and deep knowledge.

OLIPHANT, MRS. The Heir Presumptive and the Heir Apparent. (Macmillan.) Crown 8vo. Cloth. Pp. 379. 3s. 6d. New Edition.

OTTOLENGUI, RODRIGUES. An Artist in Crime. (G. P. Putnam's Sons.) Paper Covers. 2s.

A very ingenious, but slightly confusing, detective story with an entirely original motive.

RUSSELL, W. CLARK. List, Ye Landsmen! (Cassell.) Three volumes. 31s. 6d.

From the moment when William Fielding is captured by a press-gang to his successful landing of the Spanish dollars, some three years later, the reader follows the career of Mr. Clark Russell's latest hero with continual excitement. One reads with growing interest of his being run down in the Downs, of his rescue by a ship's dog, of his agreement to join in the search for the wrecked Spanish ship with its hundred thousand pounds in silver, of the finding of the treasure, the saving of the Spanish lady, of the mutiny and the discomfort of the mutineers, and of his ultimate arrival at Deal; and one wonders whether in "List, Ye Landsmen!" Mr. Clark Russell has not produced his best romance. It is, in truth, a fine story, redolent of the sea, and giving a quite wonderful sense of reality. The characters are excellent: Jimmy is as good in his way as that other ship's boy, Ransome, in "Kidnapped;" and Galoon, the dog, is a continual delight.

SAINTSBURY, GEORGE (Editor). The Works of Henry Fielding. Volumes I. and II. (J. M. Dent and Co.) Fcap. 8vo. Cloth. 5s. net.

The first volume, containing "Joseph Andrews," of a very admirable and serviceable edition of Henry Fielding, uniform in size and style with the editions of Jane Austen, Love Peacock, and the Brontës, that Messrs. J. M. Dent and Co. have already given us. Mr. Saintsbury is no doubt the ideal editor for Fielding, and his introduction, covering nearly thirty pages, is a sound critical and sensible piece of work. The volumes are illustrated by Mr. Herbert Eaton and Mr. E. J. Wheeler, and the first contains a portrait of Fielding from the bust at Taunton.

SCOTT, SIR WALTER, BART. The Monastery. (A. and C. Black.) 8vo. Cloth. Pp. 396. 5s.

The illustrations to this, the tenth and latest volume of the new edition of Sir Walter Scott that Messrs. A. and C. Black are now publishing at monthly intervals, are by Mr. John Williamson, and are unusually successful.

SCOTT, SIR WALTER. The Monastery and The Abbot. (J. C. Nimmo.) Each in two volumes. Crown 8vo. 6s. per volume.

The July contribution to the sumptuous "Border" edition of Scott, which Mr. Andrew Lang is editing, was "The Monastery." The whole of the illustrations in this novel were entrusted to Mr. Gordon Browne, who has long been known as a first-rate illustrator of books. He has been particularly happy and successful in this series of drawings, and the etchers have faithfully and well reproduced his work. Wherever the White Lady appears in the sketch the artist seems to have done his very best, although others of the drawings have unusual merit. Mr. Lang's introduction is as useful as ever; and indeed everybody who has anything to do with this "Border" edition deserves well of the student of Scott. "The Abbot," in two volumes, was added to the list on August 1, again with ten etchings after Mr. Gordon Browne. The volumes are beginning to make a valuable addition to one's library.

TASMA. A Knight of the White Feather. (Heinemann.) Crown 8vo. Cloth. Pp. 311. 3s. 6d. New Edition.

TRACKERAY, WILLIAM MAKEPEACE. The History of Pendennis. (John Dicks.) 8vo. Paper Covers. Pp. 357. 6d.

That the whole of "Pendennis" with all the author's original illustrations, should be produced and sold for what is practically fourpence-halfpenny, is little short of marvellous, yet this is what Mr. Dicks has done in this well-printed edition.

WIGGIN, KATE DOUGLAS. A Cathedral Courtship. (Gay and Bird.) Crown 8vo. 3s. 6d.

Mrs. Wiggins's new book well deserves the chorus of praise with which it has been received. The piquancy and unconventionality of the writer's style make the book a pleasant holiday companion. Two bright American girls are wooed while they are making the tour of the English cathedrals by two young men, one from Boston, the other an Englishman; and though little can be said for the plot of the story, the humour of it all is delightfully refreshing.

ZOLA, ÉMILE. Dr. Pascal; or, Life and Heredity. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 354. 3s. 6d.

A translation, by Mr. Ernest A. Vizetelly, of M. Zola's latest novel. Certain brief passages have been omitted by the author's consent, but they are in no way vital to the progress of the story. In a short preface, Mr. Vizetelly reprints an interview which Mr. R. H. Sherard had with M. Zola on the subject of "Dr. Pascal," and gives a diagram of the Rougon-Macquart genealogical tree.

HISTORY.

Annual Summaries Reprinted from the "The Times." Volume II. (Macmillan.) Crown 8vo. Cloth. Pp. 490. 3s. 6d.

This volume extends from 1876 to 1892.

CRUTTWELL, CHARLES THOMAS, M.A. A Literary History of Early Christianity, including the Fathers and the Chief Heretical Writers of the Anti-Nicene Period. (Griffin.) Two Volumes. 8vo. Cloth. 21s.

Mr. Cruttwell, whose histories of Greek and Roman literature won him a considerable reputation among scholars, intends this work both for the student and the general reader—for anyone, in fact, who desires to see for himself "what the first exponents of Christian doctrine after the Apostles believed and taught." In a short preface, he says that his purpose has been mainly literary in that he has endeavoured "to point out the leading intellectual conceptions which animate the various writers, to indicate the degree of success attained by each, and to estimate the present value of each one's contributions to the growing edifice of human thought and knowledge."

LOW, W. H. The English Language: Its History and Structure. (W. B. Clive.) Crown 8vo. Cloth. Pp. 207. 3s. 6d.

The second edition of a volume of the University Correspondence College Tutorial Series.

TARRANT, W. G., B.A. The Beginnings of Christendom: A Popular Sketch. (Philip Green.) Fcap. 8vo. Cloth. Pp. 121. 1s.

This little work, which appears in a series of "Books Illustrative of Liberal Christianity," may be praised for its simplicity, plainness, and fairness of statement. Its point of view is apparently that of a temperate Unitarian, and it gives a sketch of the first three centuries of Christianity, dwelling chiefly on the growth of the idea of Christ's divine nature, on the formation of the New Testament, and on the rise of the priesthood and formation of the creeds. Mr. Tarrant has taken pains with his subject, but he must not suppose (p. 95) that Lucian wrote in Latin.

LEGAL AND POLITICAL.

BLACK, WILLIAM GEORGE. A Handbook of Scottish Parochial Law Other than Ecclesiastical. (William Green and Sons, Edinburgh.) Crown 8vo. Cloth. Pp. 213. 8s.

The purpose of this book is to provide a concise handbook of the law relating to the affairs of a parish. The main subjects treated of are education, the care of the poor, the assistance given to the indigent to prosecute cases in the civil courts by the aid of the Poor's Roll, and the relations of a parish to the county authority.

STEPHENS, HENRY C., M.P. Parochial Self-Government in Rural Districts: Argument and Plan. (Longmans.) Large 4to. Cloth. Pp. 304. 12s. 6d.

Mr. Stephens, who claims to have had much practical experience, gathered from an official service over a long period of time in nearly every branch of local administration, is convinced that "very great advantage might be obtained from the administration of local affairs upon a system which would at once inform the mind and engage the responsibility of ratepayers through their practical participation in the work of local management." He has, for the sake of clearness, presented his suggestions in the form of a Bill.

MISCELLANEOUS.

BEETON, MRS. Family Cookery and Housekeeping Book. (Ward, Lock and Co.) Crown 8vo. Cloth. Pp. 800.

Although a smaller and less expensive volume than the well-known "Beeton's Household Management," the new work is sufficiently comprehensive for any ordinary household. Besides an endless variety of the best cooking recipes, alphabetically arranged, with coloured plates illustrating various decorative ways of laying dinner and supper tables, etc., it contains valuable hints on subjects necessary to be learnt by young housekeepers, that is, on such matters as the daily routine of a household, management of servants, the giving of entertainment, keeping accounts, etc. In short, it is a kind of guide book, showing "how to be happy—though married."

DANNATT, ALICE. **How to Become a Hospital Nurse.** (Record Press.) Crown 8vo. Cloth. Pp. 151. 1s. 6d.

FISHER, J. ALFRED. **Railway Accounts and Finance.** (Bemrose.) 8vo. Cloth. Pp. 342. New Edition.

An exposition of the principles and practice of railway accounting in all its branches.

KENT, CHARLES (Editor). **Wellerisms from "Pickwick" and "Master Humphrey's Clock."** (Record Press.) Fcap. 8vo. Cloth. Pp. 174. 1s. 6d. New Edition.

Mr. Charles F. Rideal, who is responsible for the selection of these passages, adds a short new preface, in which he answers his critics in a somewhat foolish manner.

LEE, SIDNEY (Editor). **Dictionary of National Biography.** (Smith and Elder.) 8vo. Cloth. Pp. 447. 15s.

In this volume, the thirty-fifth, covering the ground from MacCarwell to Malby, there are very few names of great importance. Interesting articles are those on Sir Henry Maine by Mr. Leslie Stephen, and Sir Thomas Malory by Mr. Sidney Lee.

PINCOFFS, MARIAN C. **What Constitutes an Efficient Nurse?** (Record Press.) 4to. Paper Covers.

Contains also other papers on similar subjects which first appeared in the *Nursing Record*.

"**The Bookman**" **Directory of Booksellers, Publishers and Authors.** (Hodder and Stoughton.) 4to. Boards. Pp. 94. 1s.

The plan of this directory is excellent, but at present the information, although seldom inaccurate, is often very inadequate. Especially is this the case with the list of booksellers, many shops and even towns being omitted. The directory of publishers, with its short histories of the different firms, is well compiled, but the list of authors will be more useful when a larger proportion of private addresses can be given. But, on the whole, the directory is one for which every "bookman" will be grateful; it is a work that wanted doing, and no doubt, now that it has been commenced, future editions will approach nearer to perfection.

The London Matriculation Directory, June, 1893. (W. B. Clive and Co.) Crown 8vo. Cloth. Pp. 140.

The Nursing Directory for 1893. (Record Press.) 8vo. Boards. Pp. 96. 5s.

Contains a directory of Nurses in England, the provinces, Scotland, Ireland, and abroad, and statistical and general information of the training schools for nurses, the nursing services, institutes, societies, insurance offices, etc.

WILSON, A. J. **Plain Advice About Life Insurance.** (Longmans.) Fcap. 8vo. Boards. Pp. 87. 1s.

The second of a series of Handbooks for Investors which Mr. A. J. Wilson is compiling from articles he has contributed to his *Investors' Review*.

WRIGHT, REV. JOHN, D.D. **Early Bibles of America.** (Gay and Bird.) Crown 8vo. Cloth. Pp. 171. 5s. net.

Mr. Wright has written only of the Bibles that were printed during the existence of the British-American Colonies and of others that appeared after the War of Independence, and has not carried the subject into Canada or other parts of North America. The volume is illustrated with a number of reproductions of different title-pages.

POETRY, MUSIC AND THE DRAMA.

AITKEN, GEORGE A. (Editor). **The Poetical Works of Robert Burns.** (George Bell and Sons.) Three volumes. Fcap. 8vo. Cloth. 2s. 6d. each net.

These three new volumes of the Alline Edition of the British Poets will very much add to the value of that admirable series. Mr. Aitken, whose memoir of his subject is an excellent piece of work, has been at the greatest pains to insure textual accuracy, and he has laid English readers under a debt of gratitude by adopting the system of explaining obscure Scotch words, not in glossary, but at the foot of each page. He has also been able to print some new pieces and to give a number of new readings from manuscripts hitherto uncolated. It should be added that the poems are arranged in chronological order, and that, except in the case of a very few words, they have been subjected neither to alteration nor expurgation. Altogether the edition, which has of course a large number of notes, is the best for the general reader that has yet appeared.

BLIND, MATHILDE. **Songs and Sonnets.** (Chatto and Windus.) Fcap. 8vo. Parchment. Pp. 119. 5s.

There are very few pieces in this collection that appear for the first time, but what there are show that Miss Blind, if she has made no particular advance, is still a graceful writer of songs and maker of sonnets.

BUCHHEIM, DR. C. A. (Editor). **Balladen und Romanzen.** (Macmillan.) Cloth. 18mo. Pp. 318. 2s. 6d. net.

A new edition of Dr. Buchheim's second contribution to the "Götter Treasuries," his first being "Deutsche Lyrik." Both are delightful little volumes.

COWEN, F. H. (Composer). **Summer on the River.** (Novello.) Octavo Edition. Paper Covers. Pp. 42. 2s.

A new cantata for female voices with words by Shapcott Wensley.

ELGAR, EDWARD (Composer). **The Black Knight.** (Novello.) Octavo Edition. Paper Covers. Pp. 68. 2s.

A cantata for chorus and orchestra—the poem ("Der Schwarze Ritter") by Uhland, and translated by Longfellow.

LE GALLIENNE, RICHARD (Editor). **The Poems of Arthur Henry Hallam, together with his Essay on the Lyrical Poems of Alfred Tennyson.** (Elkin Mathews and John Lane.) Fcap. 8vo. Boards. Pp. xxxix. 139. 5s. net.

This beautiful little volume, uniform with the same editor's recent reprint of Hazlitt's "Liber Amoris," contains practically all the more purely literary remains of the young poet and essayist whose friendship for Alfred Tennyson won him so magnificent a monument for all time in "In Memoriam." The two editions that have already appeared have long been out of print and unobtainable, and the present edition, which contains a sympathetic critical and biographical introduction by Mr. Le Gallienne, and is itself limited in its number of copies, arrives at an opportune moment to remind the reader of Tennyson that the subject of "In Memoriam" was not only a friend of the poet but a poet himself of singularly ripe achievement, considering that he was only twenty-two when he died, and a critic and essayist of some knowledge and power. Born in 1811, Hallam was two years younger than Tennyson, but, as Mr. Le Gallienne points out, his was always the stronger personality, and it is difficult to exaggerate the influence which he is likely to have had upon the Laureate's development. The critical essay upon Tennyson's early poems is an excellent piece of work, which it is still useful to read. But the poems, of course, are of the greatest interest. Mainly reflective in tone, they obviously owe much to the influence of Wordsworth. Many of the sonnets, notably a singularly fine one upon Edinburgh, are admirable, as are, too, the sonnets written to Emily Tennyson, to whom Hallam was engaged, and the "Address of Pygmalion." In fact, to re-echo his Editor, Arthur Hallam has left to posterity a precious little sheaf of poems to make sweeter his sweet memory.

LIGHTHALL, WILLIAM DOW, M.A. (Editor). **Canadian Poems and Lays: Selections of Native Verse, Reflecting the Seasons, Legends, and Life of the Dominion.** (Walter Scott.) 18mo. Cloth. Pp. 276. 1s. Canterbury Poets.

MACKAY, ERIC. **Love Letters of a Violinist.** (Walter Scott.) 18mo. Cloth. Pp. 211. 1s. Canterbury Poets Series.

The fifth edition revised and with new lyrics. If this book should reach yet another edition—and there is evidently a considerable public even for Mr. Mackay's verse—we would advise its author to omit the extremely fatuous preface.

MOORE, GEORGE. **The Strike at Arlingford.** (Walter Scott.) Crown 8vo. Cloth. Pp. 175. 5s.

In view of the discussion which this play aroused on its production, by the Independent Theatre Society a few months ago, it is interesting to see that Mr. Moore says in his prefatory note, that in his own conception of the play the labour dispute is an externality to which he attaches little importance. "What I applied myself to," he says, "in the composition of 'The Strike at Arlingford,' was the development of a moral idea."

M. T. P. **Common-Boon Carols and Other Verses, and Parodies Chiefly Relating to Oxford.** (Alden and Co., Oxford.) Fcap. 8vo. Cloth. Pp. 122.

There is so much rubbish in this little volume that the chances are that the little that is good may escape notice. Most of the Rudyard Kipling parodies, for instance, are fair—although they are certainly not parodies in the best sense of the word, in the sense suggested by Calverley and "Q"—and some of the more original verses; but there is nothing in the collection to make it interesting to other than Oxford men.

SACHS, ED. (Composer). **Water-Lilies.** (Novello.) Octavo Edition. Paper Covers. Pp. 20. 1s.

Felicia Hemans's Fairy Song, translated into German by L. Klein, and the English and German words set to music by Ed. Sachs.

SAUNDERS, DR. GORDON. **Examples in Strict Counterpoint, Old and New.** (Novello.) Paper Covers. Pp. 240. 3s.

A supplement to Dr. Bridge's "Counterpoint" in the "Music Primer Series."

STANFORD, C. V. (Composer). **Mass in G.** (Novello.) Octavo Edition. Paper Covers. Pp. 76. 2s. 6d.

WALKER, T. A., M.A. (Translator). **The Odes and Carmen Saculare of Horace.** (Elliot Stock.) Parchment. Pp. 115.

RELIGIOUS AND THEOLOGICAL.

MAURICE, F. D. **Social Morality.** (Macmillan.) Crown 8vo. Cloth. Pp. 414. 3s. 6d.

A new edition of twenty-one lectures delivered in the University of Cambridge, and designed by Maurice specially for young men. They deal with a subject which cannot be studied too closely, and at the time the lectures were delivered they provoked much controversy. Maurice dealt with morality

under three heads—Domestic, National, and Universal; and he did so with all the originality and breadth of view which always characterised his utterances. Messrs. Macmillan have also added to this new edition of Maurice's works, his "Friendship of Books," (3s. 6d.), which contains, *inter alia*, essays on "Words," "Books," "The Use and Abuse of Newspapers," "The Fairy Queen," "Milton," "Milton Considered as a Schoolmaster," "Edmund Burke," and "Critics." The preface to the volume is by Mr. T. Hughes, Q.C.

MILLER, REV. J. R. Come Ye Apart: Daily Readings in the Life of Christ. (Sunday School Union.) Crown 8vo. Cloth. 3s. 6d.

For every day of the year a text, taken from the Gospels, is given, followed by a page of comments suggested by its meaning. These readings are "neither exegetical nor expository, but are rather practical and devotional hints."

SMITH, GEORGE ADAM. The Preaching of the Old Testament to Age. (Hodder and Stoughton.) Crown 8vo. Cloth. Pp. 60. 1s.

A lecture delivered at an inaugural address on the author's induction to the chair of Hebrew and Old Testament Exegesis in the Free Church College, Glasgow.

The King and the Kingdom: A Story of the Four Gospels. (Williams and Norgate.) Three volumes. 8vo. Cloth. 3s. 6d. each.

The author feels that "under the pressure of a systematised theology the gospel of Christ has lost much of its freshness and power," and disregarding alike dogmatic interpretations and hostile criticisms, it has been his endeavour in these volumes to take everything as it stands "without abatement and without addition, the single object being to arrive at the facts intended to be conveyed by the evangelists, and to grasp the truths and doctrines taught by Jesus."

WINEWORTH, SUSANNAH (Translator). Theologia Germanica. (Macmillan.) 16mo. Cloth. 2s. 6d. net.

A new edition in the Golden Treasury Series of a popular translation of the "Theologia Germanica," with Charles Kingsley's preface, the translator's historical introduction, and Chevalier Bunsen's letter to the translator. This German work ranks with Keble's masterpiece as one of the few works which appeal to the common spiritual instincts of humanity. It was written by an unknown monk in the fourteenth century, was translated by Luther, as the best representative of the Christian life after the Bible, and is regarded to-day as a rallying point for sections of Christendom almost without a rival among all creeds and confessions.

SCIENTIFIC AND PHILOSOPHICAL.

BOTTONE, S. R. Electricity and Magnetism. (Whittaker.) Crown 8vo. Cloth. Pp. 203. 3s. 6d.

A volume of Whittaker's Library of Popular Science designed to present an easy and attractive introduction to the sciences of electricity and magnetism, but which is in no sense of the word a text-book to the subjects. It is thoroughly well illustrated.

DUTTON, THOMAS, M.D. Indigestion, Gout, Corpulency and Constipation Clearly Explained, Treated and Dieted. (Henry Kimpton.) Crown 8vo. Cloth. Pp. 214. Third Edition.

FIELD, HENRY M. The Story of the Atlantic Telegraph. (Gay and Bird.) Crown 8vo. Cloth. Pp. 415. 7s. 6d.

A very interesting and well illustrated description of the laying of the electric cable between England and America. It is just the book to give to an intelligent boy interested in electricity or general science.

JUKES-BROWNE, A. J., F.G.S. Geology: An Elementary Handbook. (Whittaker.) Crown 8vo. Cloth. Pp. 248. 4s. Illustrated.

KNEIPP, SEBASTIAN. My Water Cure as Tested Through More Than Thirty Years. (Blackwood.) Crown 8vo. Cloth. Pp. 281. 5s.

A second edition, with new appendix, containing an account of the latest developments of Dr. Kneipp's system, and a preface by Miss E. Gerard. The volume is illustrated with a portrait and numerous technical sketches.

LANG, ANDREW. Custom and Myth. (Longmans.) Crown 8vo. Cloth. Pp. 312. 3s. 6d.

A new edition of what is perhaps Mr. Andrew Lang's best known and most valuable work. It now appears in the Silver Library with a brief new preface.

MONIER-WILLIAMS, SIR MONIER, K.C.I.E. Indian Wisdom; or, Examples of the Religious, Philosophical, and Ethical Doctrines of the Hindus. (Luzac.) 8vo. Cloth. Pp. 575.

The fourth edition, with several additions and improvements, of a work which, the author says, is designed as much to give a summary of Sanskrit literature as to present the reader with examples of certain selected portions of that literature. The volume also contains some account of the past and present condition of India, moral and intellectual.

MÜLLER, F. MAX, K.M. Theosophy or Psychological Religion. (Longmans.) Crown 8vo. Cloth. Pp. 585. 10s. 6d.

The Gifford Lectures for 1892. In his preface Professor Max Müller says that the three principal themes of his lectures were "the discovery of God, the

discovery of the Soul, and the discovery of the oneness of God and the Soul," and that he has attempted to treat each of them, "not simply as a philosopher, but as a historian."

SHIPLEY, ARTHUR E., M.A. Zoology of the Invertebrata: A Text-Book for Students. (A. and C. Black.) 8vo. Cloth. Pp. 458. 18s. net.

An attempt "to give such an account of the Invertebrata as might be useful to students in the upper forms of Schools and at the Universities, who are already acquainted with the elementary facts of Animal Biology." The volume, which is profusely illustrated, is in no sense a work for advanced students.

TRAVEL, GEOGRAPHY, AND TOPOGRAPHY.

BANCROFT, HUBERT HOWE. The Book of the Fair. Part I. (The Bancroft Company, Chicago.) Folio. Pp. 40.

Such a summary of modern civilisation as the Chicago Exhibition should be worthy of some permanent and adequate record. The Bancroft Company propose to prepare this record in the shape of "The Book of the Fair," to consist of twenty-five parts of about forty imperial folio pages each, issued at the rate of two parts per month. The text of this work will be written by Hubert Howe Bancroft, the historian of the Pacific Coast regions, and the illustrations will be of a high order and very abundant. Part I. has already been issued and forms a well-proportioned introduction to the numbers soon to follow. In it Mr. Bancroft reviews the principal World's Fairs of the past in various parts of the earth, and outlines the history and present condition of Chicago.

BARRETT, C. R. B. Illustrated Guides to the Eastern Counties. (Lawrence and Bullen.) Paper Covers. 6d. each.

Two new volumes of this excellent series, dealing respectively with Yarmouth and Caister, and Colchester and Lexden.

BENSON, GEORGE. The New Handbook to York Minster. (Ben Johnson and Co., York.) Small 4to. Cloth. 1s. 9d. net.

Contains notes on the architecture, stained glass, shields, and monuments of the Minster, illustrated with twelve excellent colotype plates and nine plans.

BOOTH, W. The Isle of Man. (W. E. Clegg, Oldham.) 18mo. Cloth. Pp. 103. 1s.

A well-arranged guide, belonging to the Itinerary Series, with an excellent map.

FITZGERALD, PERCY. London City Suburbs as They are To-day. (Leadenhall Press.) Large 4to. Cloth. Pp. 349. £2 2s.

Although Mr. Percy Fitzgerald's letterpress is adequate and entertaining, the interest of this very fine volume is largely pictorial. Mr. W. Luker's illustrations—of which there are many hundreds—are entirely admirable: there is hardly a beautiful scene in or near London of which he has not caught the charm. The volume is in fact a magnificent one, and now that, as Mr. Fitzgerald says, so much that is picturesque is being destroyed, a pictorial and literary record of this kind is of great value. The scope of the book is generous: it extends from Berkeley Square to Barnes, Bellingham, Greenwich, Harrow, Hampton Court, Lee, Merton, Twickenham, and all the other districts near and far, to which the title of suburb can be given. For the appearance of the volume there can be nothing but praise. The binding is singularly neat and tasteful, and paper and print leave nothing to be desired. Certainly no more beautiful gift-book has lately appeared.

GIBSON, MARGARET DUNLOP. How the Codex was Found. (Macmillan and Bowes, Cambridge.) Crown 8vo. Pp. 141. Illustrated.

This is a narrative of two journeys made by Mrs. Lewis and Mrs. Gibson to the convent at Mount Sinai, and the discovery there of an early and important codex of ancient Syrian Gospels, as well as three other valuable collections of later date. The work of these two ladies is of the utmost importance and interest to the student of the Scriptures; but the story is told in too scrappy a style.

LINN, THOMAS, M.D. The Health Resorts of Europe. (Henry Kimpton.) Crown 8vo. Cloth. Pp. 330.

A medical guide to the mineral springs, climatic, mountain, and seaside resorts, and milk, whey, grape, earth, mud, sand, and air cures of Europe. A preface is contributed by Mr. A. T. Sansom, Physician to the London Hospital; and a directory of physicians is appended.

SMITH, REV. ALFRED C., M.A. The Autobiography of an Old Passport. (Digby and Long.) 8vo. Cloth. Pp. 586. 21s.

Relates how the writer accomplished many driving tours with his own English horses over the roads of Western Europe before the time of railways. There are many interesting pages in the volume, especially to readers who know the Continent well, but there is much that is wearisome, and the illustrations are little better than caricatures.

TRISTRAM, W. OUTRAM. Coaching Days and Coaching Ways. (Macmillan.) Crown 8vo. Cloth. Pp. 376. 6s.

A new edition of a work which is valuable not only for Mr. Outram Tristram's interesting letterpress, but for the exquisite illustrations, of which there are over two hundred, by Mr. Hugh Thomson and Mr. Herbert Railton. The volume is similar in style to the beautiful editions which Messrs. Macmillan have published, and Mr. Hugh Thomson has illustrated, of "The Vicar of Wakefield," and "Cranford."

CONTENTS OF REVIEWS AND MAGAZINES.

ENGLISH AND AMERICAN.

- Altruistic Review.**—21, Quincy Street, Chicago. July 15. 20 cents.

THE WEDDING MORNING.

What happy recollections are recalled to those who have helped a Bride with her Toilet! Friends ask themselves, has the bride a thorough knowledge of all the duties of a household, especially of that ever-recurring worry, Washing Day and Spring Cleaning? Does she know what SUNLIGHT SOAP can do? Does she know that for a few pence, without boiling or bleaching, she can, by using SUNLIGHT SOAP, have all the household linen washed at home and made to look white as snow and fresh as roses!

Happy is the bride who has been instructed in these matters, because it is on such simple household details as these that the future happiness and comfort of herself and husband must depend!

SUNLIGHT SOAP.

THE NEW VOLUME
OF THE
"REVIEW OF REVIEWS"
(VOL. VII.)
IS NOW READY.

Handsomely Bound, Price 5s.; by post, 5s. 6d.

Vols. 3, 4, 5, and 6 are still in print.

As a record of contemporary history, politics, and literature, these volumes occupy a unique place. They contain the essence of all that has occurred of importance during the period which they cover.

MR. GEO. THOS. CONGREVE'S TREATMENT.

CASE OF "HOPELESS PHTHISIS"

BROUGHT HOME TO DIE!

BUT CURED! BY THE TREATMENT OF
Mr. GEO. THOS. CONGREVE.

"DEAR SIR.—I have much pleasure in writing you to say that one of my sons, whose life was despaired of in consequence of Consumption having supervened an attack of inflammation of the lungs, has been completely restored to health by your invaluable treatment. I cannot speak too highly of your medicine, for a more complete and wonderful cure, I think, has never been effected by any other medicine. My son returned home in a hopelessly dying state. By accident I heard of your remedy, and determined to try it. My wife and other members of my family were surprised and delighted to notice some change for the better, after a few days only; and in a few months, I am glad to say, my son was entirely restored to health, and is now one of the strongest and most robust of our family.

"As the publication of this case would, I think, do much good, you can make any use you like of this letter, &c. I shall write an account to my relatives living in Tasmania and Queensland, and should suggest your inserting this in the papers there.—I am, dear Sir, yours gratefully, JOHN B. HARDWICKE, Selby Villas, Pottlewell Street, Southend, Essex."

In confirmation of the above, Mr. Hardwicke has sent me the certificate of his son's discharge from the Royal Navy: "Sydney Hardwicke *invalided; case, Pneumonic Phthisis.*" Also a certificate as to his present state of health from a surgeon at Southend:—"I hereby certify that Sydney Hardwicke is sound in body and of good constitution."—9th August, 1892.

THE REVIEW OF REVIEWS

THE PROGRESS OF THE WORLD.

LONDON, September 1, 1893.

Home Rule
Bill of the
Commons.

To-night the Home Rule Bill is to be read a third time and passed by the House of Commons. Next week it is

to be slaughtered by the Peers, and eager partizans are already straining their ears to catch any echoes of the tom-toms which are beaten daily to incite the indignant electorate to cry, "Down with the House of Lords!" So far the only echo distinctly perceptible is the return of a Unionist by Hereford in place of a Gladstonian M.P., who resigned, sick of the double dose of Clause Nine and the refusal of the Government to espouse the sacred cause of Bimetallism. The outlook is not encouraging to those who would make short work of the Second Chamber. So far from an indignant country

rising in the majesty of its wrath to hurl the Peers into the Thames, it seems probable that if there is to be any demonstration of popular feeling in England, Wales, or Scotland, it will be on the other side.

The Need of a Second Chamber. The curious thing about the present situation is that Ministers have done more than any set of men in this century to convert the electorate to a belief that a Second Chamber is a necessity. They have insisted upon setting up a Second Chamber in Ireland, and Mr.

Gladstone has spent all his eloquence in support of Second Chambers. That, however, is but a small thing compared with the immense object lesson which has been afforded the country of the ease with

which the House of Commons can be gagged and paralysed by the combination of a loquacious minority and a headstrong majority. The country hitherto has believed that the House of Commons could be relied upon to discuss all the clauses of any important Bill fully and carefully, and it was disposed to regard a further discussion in the House of Lords as unnecessary surplusage. The experience of this session has dissipated that illusion. Whether it be the fault of the minority or of the majority, the fact is indisputable that at least one half of the Home Rule Bill has been

MR. C. W. RADCLIFFE COOKE, M.P. FOR HEREFORD.

passed by the House of Commons without any discussion at all. Seeing this, the British elector begins to perceive that there may be something in the "two Chamber superstition" after all. The guillotine in the Commons may prove to be at once the justification and the salvation of the House of Lords.

The Voting Machine.

The process of converting the House of Commons into a mere voting machine has gone on so rapidly that, after having limited liberty of speech, the majority last month

sanctioned a further limitation of the liberty of voting. When the first form of the guillotine was carried, the House at a given moment ceased to debate and voted silently upon all the amendments on the paper. This was not sufficiently drastic for the exigencies of the Ministry. The guillotine brought into use for the closure of the Debate on the Report stage of the Bill deprived the House not only of the right to debate, but also of the right to vote upon the three hundred and odd amendments which were still standing on the paper. The only amendments on which the sense of the House could be taken were those proposed by Ministers; all the others were voted down *en masse*. The result is that the Bill has been got through in August in time to die with the partridges in September, but it will probably be found that the electors grudge the guillotine as the price of Home Rule.

Old Fogey-
dom Ram-
pant.

The House of Commons has landed itself in this deplorable *impasse* chiefly because of its insufferable self-conceit. To begin with, what can be more ridiculous than a Chamber of nearly 700 members with room to seat about 400 comfortably? Or what can be more absurd than setting the whole of these 700 members at work revising the details of a long, complicated measure in Committees of the whole House, without any limitation upon the length of speeches and without any contrivance for expressing their opinion except the cumbrous and tedious process of filing in and out of the Division lobbies? A Chamber in which every member has his seat, and an electric button by which he can vote aye or no without the loss of a moment of time, is surely not beyond the collective wisdom of the grandmother of Parliaments. Neither ought it to be impossible to divide any great measure into sections, referring each section to a special Committee, representing all parties, who would go through all details, only referring to the House, as a whole, questions of general importance. If these Committees were fairly representative of the balance of parties in the House, this arrangement would work no injustice and it would enormously expedite business. This, with a non-party Committee appointed at the beginning of each session to distribute the available time according to the necessity of public business, a competent Chairman of Committees, and a limitation of the length of speeches, might save the House of Commons from perishing beneath public contempt and the mass of its own business. A patent digester that bolts 50 per cent. of its food undigested can

hardly be regarded as up to its work, even at Westminster.

More
Guillotine.

Meanwhile, in the present chaotic condition of affairs, the only remedy possible against obstruction is guillotine, and if that fails then more guillotine. Soon the guillotine will be going always in St. Stephen's as it went *toujours* at Paris in the days of the Terror. It is now announced that if Supply is blocked, Supply is to be thrust through by guillotine delivery, to the great delight of all permanent officials, who, however, may not relish so much the immediate and necessary sequel to such a measure, viz., the reference of all estimates to competent committees with instructions to report to the House only such points as are of too general an interest to be settled in Committee. The application of the guillotine to Supply is a novelty, but there is no reason to believe that Ministers will shrink from ridding themselves in this way of obstructive criticism which is avowedly intended to retard the realisation of their programme.

Mr. Morley has vindicated to the satisfaction of his constituents the conduct of the Government in using the guillotine.

His argument that eighty-two days have been devoted to the Home Rule Bill, and that eighty-two days ought to have been enough, may be sound. He may score a party advantage in heaping all the blame for the scamped work of debate upon the Opposition. But granting the utmost that can be said as to the bad faith and perversity of the minority, it was a minority, and it ought not to have been allowed to practically destroy the House as an arena for debate. The majority have the power, and the majority have the responsibility, and while no reasonable person can object to measures that are necessary for the despatch of public business, a great many people will object to an alternating policy of allowing a saturnalia of obstruction and disorder, and of closing all debate by the guillotine that forbids even a division upon the amendments on the paper. That is not a business-like way of doing business.

Pledges that
cannot be
kept.

There is to be an Autumn Session, in order to enable the Government to make some progress with the Newcastle programme. Mr. Morley told his constituents: "We shall not flinch. We mean to fight it out on these lines all this year"—a variant upon General Grant's famous phrase. What they are going to do in the Autumn Session is, however, not quite clear. Mr. Morley has not rubbed elbows with Mr. Gladstone

so long in the House of Commons without acquiring some of his adroitness in avoiding specific pledges. He spoke vaguely, but in a manner that was intended to convey the idea that the Autumn Session is to be devoted to the Parish Councils Bill. "After this measure," said Mr. Morley—

We have a number of smaller projects. We have given pledges that we will do what we can—and we believe we can do much—to shake off from Wales the yoke of an un-national, and I may say an anti-national, Church. We have given pledges that we will deal with the temperance question to the best of our ability. All these pledges we hope to redeem, and we mean to redeem.

Mr. Morley has forgotten "the tough creeper, and thistle-like plants of strange monstrous growths" which obstruct the legislator's path, to say nothing of "the ferocious black ant" which torments him all the time. Mr. Morley did not name his ant, but there is little doubt that its name is Joe, and its *habitat* Birmingham.

Statistics of the Debate. The discussion of the Bill lasted 82 days, 12 of which were spent on the second reading, when 45 speeches were made for the Bill and 51 against it. The first two clauses were discussed 19 days in Committee. Of the 331 lines of the Bill which have been discussed, 88 lines were added by the Government after the second reading, and 37 were added out of deference to the representations of the Opposition, while 37 lines of the original Bill were struck out. Mr. Morley contends that the amendments added to suit the views of the Opposition were immaterial, and if they were struck out to-morrow, with three or four exceptions, would not make a jot or tittle of difference. That, however, cannot be said of the amendments introduced by the Government, which completely revolutionised the clauses relating to the retention of the Irish Members at Westminster, and to the financial relations between Ireland and Great Britain in the future. So sudden and so complete was the change of front on the vital subject of the retention of the Irish Members that the Liberals at Hereford actually distributed, as the only available electoral ammunition, tracts sent down from the central caucus defending Clause Nine with its unworkable in-and-out arrangement—in happy ignorance of the fact that the in-and-out clause had been abandoned by its own authors!

What is to be done? Before these pages see the light, the Home Rule Bill will be a thing of the past, and everything will have to be begun again. What is to be done? We do not suppose that Mr. Gladstone will propose to consume

another eighty-two days next Session in re-discussing the same Bill all over again. There is a report that he will introduce it in the House of Lords in order to have breathing-time for British legislation in the House of Commons. As this would be equivalent to unceremoniously hanging the question up for another year, Mr. Gladstone is not likely to adopt it, neither is he likely to appeal to the country. Mr. Morley's hint to the electors of Newcastle, "You will have, by-and-by—not very soon, I hope—to decide upon what we have done," indicates plainly enough that there is no intention of immediately appealing to the constituencies. Is there then any middle course? I see only one, and that is the suggestion I made last month. Let the Government introduce a brief Bill empowering an Irish National Convention to frame a Bill for the better government of Ireland, to be submitted, when complete, to the Imperial Parliament for consideration. Why should the Irish not thrash out all these questions for themselves? We should be in a much better position to estimate the chances of a solution of the Irish difficulty if we could have the full free discussion of all the details of the new scheme in Ireland before beginning to discuss the question in Westminster. It would be much more respectful to the Irish to give them an opportunity of saying what it is they really want before attempting to give them what we think they want. The Bill establishing the National Convention need not occupy more than a page of foolscap; it could be discussed and passed in a month, and it would, when thrown out by the House of Lords, afford an admirable fighting programme on which to go to the constituencies. Many Liberals would object to vote for the Home Rule Bill as it left the House of Commons. No Liberal would object to summon into existence an Irish Convention in order that we may be informed, after full and careful consideration, what kind of a Government it is that the Irish really want.

When will the General Election come? The General Election is not to come "very soon," according to Mr. Morley. When will it arrive? Ministers will not dissolve this year if they can help it, and it is improbable that Lord Salisbury, even if he were sent for by the Queen, would advise an immediate dissolution. Whether or not Mr. Gladstone is able to face the House of Commons next year—and neither his sight nor his hearing is as good as it used to be—the Liberal majority will have to force something through that will satisfy the Irish. The House of Lords will, of course, reject that something, whatever it is, and then it is supposed the dissolution will come.

Before it comes Ministers will try to make as good a parade as they can of their legislation; but it is evident, even to the most sanguine, that it will be but a beggarly array of disappointed expectations. The Liberals will blame the Tories, and the Tories will blame Home Rule. The country will blame both, but it will blame itself most of all if it a second time sends up an indecisive majority. A majority of 38 exclusively composed of Irish allies who repudiate as flat blasphemy all suggestions of organic union with the Liberal parties, is not sufficient to force through a great organic change. A majority of 138 would be more adequate. But that at present appears more likely to come on the other side than on ours. In that case the Liberals' chief hope would be in the excessive size of the Unionist majority, and the certainty that the paths of Mr. Chamberlain and Mr. Balfour will not always coincide.

enthusiastic leader of the forces of the Catholic democracy—has been defeated. M. Clemenceau has to stand the racket of a second ballot. M. Wilson has been elected. There are so few figures in the dead level of mediocrity, which is the characteristic of French politics, that English observers are at some loss to understand the precise significance of the polls.

M. Waddington, addressing a group of newly-elected deputies, pointed out that while everybody was vaguely agreed that certain things were wanted, no one seemed to have any particular idea as to how to get them. "Everybody," he said, "agrees that we want a diminution of expenses, a better division of taxes, the establishment of a serious public debt sinking fund, but nowhere do I find any practical or precise propositions." It is so in other regions than those of

From the Westminster Gazette.]

REPUBLICAN PROGRESS IN FRANCE—THE DECREASE OF THE CONSERVATIVE (BLACK) AREA.

The French Elections.

While we are discussing when our General Election will take place, the French have actually elected their new Chambers. The second ballots are still to be taken, but it would seem that Siam has wiped out Panama, and that the French elector is inclined to give his present rulers a fresh lease of life. The ultimate issue of the elections is somewhat obscure. The result of the first day's polls was as follows:—

Republicans and Radicals—more or less moderate . . .	315
Radicals and Socialists—more or less extreme . . .	30
Conservatives	58
"Rallied" Conservatives	13
	<hr/> 414

140 second ballots are necessary. The Republicans have gained 63 seats, so far, and expect to gain more. M. Jules Guesde has been elected as Socialist representative of Roubaix. The best man in French politics—M. de Mun, the pious, eloquent and

finance. The only fixed and definite idea in the French mind seems to be a determination to keep up the biggest army in Europe. That is clear. Everything else is vague, and especially the question as to the use to be made of that army now they have got it. Here and there observers report a curious antipathy to England, and warnings are raised that France might possibly deem it wiser to "run into something cheap" by attacking England, rather than stake her existence on the dubious issue of a conflict with Germany. There are fools and madmen of the criminal type on both sides the Channel, but such a contingency as that of a French attack upon England can hardly be contemplated as probable except in case a whole nation once more went mad.

The Pope as Grand Elector.

Nothing is more interesting in the French elections than to note the result of the Pope's intervention. The Pope would appear to have gained his end by the sacrifice of his

faithful followers. He has sacrificed his dragoons but gained the pass, and that is probably justification enough in his eyes for the very decided and dangerous step which he took in ordering the French Catholics to execute a right-about-face on the very eve of the election. There is something very fascinating to the human imagination in the spectacle of this aged priest of the Vatican intervening with decisive voice in the electoral arena of Voltairean France. Having put his hand to the plough, Leo the Thirteenth, by a second letter issued on the eve of the balloting, showed that he has no intention of letting go until he has finished his furrow. Many Catholics in France, M. D'Haussonville at their head, had refused to rally to the Republic on various pretexts. They explained away the Pope's counsels, and declared that their zeal for the Catholic Church rendered it impossible for them to support the Republic, which is but legalised Freemasonry. To all such malcontents the Pope replied with as much vigour and effect as if, instead of being Leo XIII., he had been a Mr. Chamberlain, denouncing disaffection in a caucus. "It is both unfortunate and absurd," said the chief pastor sarcastically, "that our counsel should meet with any one who, boasting that he has more solicitude for the Church than we ourselves, arrogates to himself the right of speaking in its name against the teachings, instructions, and prescriptions of Him who is at once the protector and the head of the Church." The Pope, it is evident, will stand no nonsense when he acts as Grand Elector.

And yet and yet, the dear good old Pope will have to learn, like all other men, that there is no such thing as infallibility in politics, and that popes can blunder just as badly as heretics when they take to wire-pulling. In the present instance the general judgment of impartial outsiders no doubt is heartily on the side of the Pope. He is doing to-day what Cardinal Manning urged him to do many years since. But how inconsistent it is, to be sure! The Kingdom of Italy has been constituted longer than the French Republic. The interests of the Church suffer far more grievously in Italy than they do in France from the maintenance of an attitude of irreconcilable hostility to the established Government. But where is the Archpope who has the right to preach to His Holiness of the Vatican the excellent sermon which the latter has just preached to the Royalists of France? Who is there who can persuade the Vaticani "to recognise and loyally preserve the Constitution of the country as it

is established . . . that thus in common fraternal effort they might provide for the prosperity of the "Common Fatherland"? Alas! there is no such potentate, and the unfortunate but well-meaning Leo has to blunder on without the benefit of guidance from any superior authority, such as he by his position is able to give to the Reactionaries of France.

Franco-Italian Animosity.

There is little doubt that if France went to war with Italy, many in the Vatican would eagerly welcome the French invader in the hope that the bayonets of the foreigner might re-establish the temporal power. And the excitement caused by the bloody fracas at Aigues-Mortes was a very disagreeable reminder how easily the two Latin nations might come to blows. Aigues-Mortes is a small town noted for its salt-works, in the south-east of France, not very far from Nîmes. The introduction of some Italian labourers at one of the salt-works led to bad blood between the new-comers and the Frenchmen, who regarded the Italians as blacklegs and knobsticks and scabs, to use the three technical terms employed by the English, Americans, and Australians to describe the workman who works for less than the standard rate of wages. Bickerings rapidly developed into fighting, and as all these southern workmen are armed, it was no mere affair of fisticuffs. When two Frenchmen were killed, the French workmen rose *en masse* and hunted down the Italians as if they had been wild beasts. In vain the police and gendarmes endeavoured to separate the infuriated combatants. The Italians, although outnumbered and besieged in barricaded farmsteads, fought savagely, and it is estimated that fifty were killed and one hundred and fifty wounded on both sides before the arrival of the soldiery stopped the bloodshed. The Italians being cleared out, the mayor issued an astonishing proclamation congratulating the townsmen upon their success and the complete satisfaction of their demands. It is satisfactory to know that this functionary was promptly made to resign, but his proclamation sheds a sinister gleam of light upon the state of French sentiment in the district.

The Agitation in Italy.

The immediate result of the bloodshed in Aigues-Mortes was a series of popular demonstrations against France in the Italian cities, which might very easily have brought about the long-expected war. Angry mobs in Rome attacked the French Embassy, and it was not without considerable display of armed force that the Italian Government was able to prevent the populace from looting the Embassy. In other cities more or less

serious attacks were made upon Frenchmen, and in one case the tramcars of a French company were burned. Fortunately it suited neither Governments to allow the passion of the mob to precipitate a general war, and hence both at Rome and at Paris every disposition was shown to accept the official explanations, and to declare the incident at an end. The *causa causans* of the incident is, however, by no means at an end. That is the influx of foreign labour into France. The French census returns published last month show that the number of foreigners in France rises even more rapidly than the French population declines. In 1851 there were only 63,307 Italians in France, in 1891 their number had risen to 286,042. Forty years ago foreigners of all nationalities domiciled in France only numbered 380,000; to-day they number 1,130,211. The Belgians alone number 465,860. The Belgian, the Italian, and the Spaniard represent to the French workman the danger with which Chinese cheap labour menaces the Australian and the Californian. Hence these attacks on the Italians, of which M. de Rochefort, according to an interesting interview in the *Daily Chronicle*, heartily approves.

The Zurich Congress. When French and Italian workmen were cutting each other's throats on the

Mediterranean, the representatives of the workmen of all nations were engaged in discussing at an International Congress at Zurich how best to impress the *bourgeoisie* and upper classes generally with a sense of the solidarity of labour. As a matter of fact, which is only too patent, there is no such thing. There is far more intense animosity between workmen who undersell each other in the labour market than there is between German and Frenchman. The old national feuds are effete and anæmic compared with the savage hatred that prevails between the unionist and the blackleg. The French salt-workers did not shoot their Italian brothers because they spoke Italian and were subjects of King Humbert, but because they were willing to work for so many francs less per week than the standard wage. The Zurich Congress, however, was notable enough in its way, if only because of the conspicuous superiority of Mr. Hodge, the Scotch chairman, over all the others who filled the chair. The day Mr. Hodge presided, the Congress despatched more business than on all the other days put together. In all future Congresses it would be well to provide that no one but a Scotchman shall occupy the chair. The Anarchists were expelled—not without much preliminary hubbub—after which

the Congress was permitted to despatch its business. These Congresses may do good if they teach the leaders of the European workmen the importance of learning English, and familiarise the workers of the Continent with the practical methods of English trade unionists.

The odd perversity which leads some reformers never to lose a chance of Women at the Congress. tweaking the noses of their best friends

was conspicuously illustrated by the drafting of the Zurich resolution about woman's labour. Notwithstanding the fact that the working women have no more loyal supporters than the advocates of woman's rights, the framers of the resolution demanding legislative protection for women actually prefaced it by a preamble asserting that "the middle-class women's rights movement rejects all special legislation on behalf of working women." Fortunately this calumny was detected in time by the delegates of the British women, and the aspersion was condemned by the Congress. The resolution demanded the following measures for the protection of working women:—

1. A maximum working day of eight hours for women, and of six hours for young persons under 18.
2. Cessation of work for thirty-six consecutive hours in every week.
3. Prohibition of night labour.
4. Prohibition of labour in all trades especially dangerous to health.
5. Prohibition of women working two weeks before, and four weeks after confinement.
6. The appointment of an adequate number of women inspectors for all trades and industries in which women are employed.
7. The above provisions to apply to all girls and women employed in factories, workshops, shops, home industries, and in agricultural labour.

The Coal Strike.

It must be admitted that we have not had much reason to boast of our superior method of settling trade disputes, when our papers are full of narratives of the misery and strife occasioned by the refusal of the Miners' Federation to go to arbitration on the demand for a reduction of wages. The Miners' Federation for some time past appears to have been managed for no other reason than to prove how much more sensible are the miners of Northumberland and Durham than those who belong to the Federation. If Mr. Pickard had but been as sagacious and courageous a man as Mr. Burt, the miners would have been saved a million of money. The loss of wages occasioned by the refusal to arbitrate is but a small evil compared with the savage animosity that such a strike lets

loose. In South Wales, the determination of the men of Ebbw Vale to continue working led to such threats of an intimidatory invasion on the part of the Rhondda miners as to compel the authorities to fill the district with troops, and to prepare for a squalid outbreak of civil war. Fortunately the soldiers being ready to hand, and the distance between the Rhondda valley and Ebbw Vale sufficient to tire out the invading forces before they came to blows, no blood was shed. But the whole episode is disgraceful to the civilisation of the community, and it is much to be regretted that any support should have been given to those who inflicted this grave calamity upon the country by their refusal to submit their case to the judgment of an impartial arbitrator.

The Arbitration about the Seals. While workmen refuse to arbitrate, the diplomatists who represent the older régime, concerning which so many hard things have been said, are congratulating themselves upon the successful issue of the Behring Sea arbitration. The pleadings, which were long and able, have been fully heard, and the decision upon all the material points is virtually unanimous. All the impartial arbitrators, that is to say the representatives of France, Sweden, and Italy, have decided in favour of the British view of the case. One of the American arbitrators voted for the American contention all through, but his colleague voted with the majority on the most vital points. We have now, therefore, gained an authoritative decision by a thoroughly competent court that the American claim to treat the northern end of the Pacific Ocean as an American lake is absolutely baseless, and without any justification either in fact or in international law. That is very satisfactory, for if there is one thing more objectionable than another it is a tribunal which gives an uncertain sound. Not less satisfactory is the unanimous recommendation of the arbitrators that rigorous measures should be taken at once to protect the fur seal from the destruction which threatens to deprive ladies of sealskin jackets before the close of the century. The American Government which seized Canadian sealers in contravention of what is now declared to be the law, will pay compensation, and the two Governments will lose no time in carrying out the other recommendations of the arbitrators. It is probable that Russia and Japan as well as Britain and America will have to be parties to the Seal Protection Act. It will be odd if a Pacific Concert should come into existence for the preservation of the seal as the European Concert was created to

secure the preservation of the Ottoman Empire. Of the two the seal is much the worthier object.

War and Rumours of War.

It is remarked by a writer in *Lippincott* that of all the exhibits at the World's Fair, there is none which attracts such immense crowds as the exhibit of arms and munitions of war. This may be no sign of martial hankerings on the part of Uncle Sam, but simply the love of the unfamiliar. In Europe quick-firing guns are too common to attract a crowd. In the United States, where you may spend a lifetime and never see a soldier, the weapons of his dreadful trade appear to be of all curios the most curious. Here in Europe we are habituated not only to their exhibition, but to their use, although, fortunately, Europeans use them mostly upon the natives of other continents than their own. The French having extorted twenty shillings in the pound from the Siamese, have, as an after-thought, made their claim guineas, and the new demand has threatened a rupture of negotiations which may end in a renewal of hostilities. The Siamese, with great efforts, paid their indemnity and ceded their territory, only to find that the French negotiator sprung new demands upon them, which it is stated practically amount to the recognition of a French protectorate. The French have a giant's strength, and they do not deem it tyrannous to use it like a giant. Lord Dufferin, who has displayed his usual tact and good-humoured wisdom in preventing misunderstandings between England and France, is perhaps the most important public man in the British Empire just now. A single false step or one impatient word on his part, and Europe—and not Europe only—might enter upon the fatal incline which leads to war.

Lobengula, the lord of the Matabele, is in a dangerous mood. He has refused the subsidy he has hitherto received with alacrity from the Chartered Company, and has sent a message to Mr. Rhodes by Mr. Collenbrander, our agent at Buluwayo, that he will pay no damages and make no reparation until the Mashonas at Victoria are given up to him. To emphasise his dissatisfaction, impis are said to have taken up positions on the Toku river west of Victoria, and on the Sebaki, half way to Fort Salisbury. Dr. Jamieson, a shrewd and cool administrator, has telegraphed that the situation is impossible. Mr. Selous, the famous elephant-hunter, has hurried off to the scene of action, and the Bishop of Derry, who is at Cape Town, has indited an eloquent letter, inviting the British to the smashing of Lobengula. It is calculated that

the enterprise could be accomplished for half a million, and it is urged that the money would be well spent. All the same, we sincerely hope that Lobengula will not force matters to an issue at present. It may be necessary to increase the number of fortified posts along the frontier of Mashonaland, and to multiply the number of Maxim guns, for of course we cannot allow the Matabele to raid and massacre our Mashona workmen. But, notwithstanding the bishop's exhortations, the memory of the Zulu war is too recent for any one to undertake with a light heart a campaign against Buluwayo. It is a great consolation to know that Mr. Rhodes is dealing with the dusky Napoleon of the Matabele. He will not use steel if gold will serve his turn.

Uganda and East Africa.

Sir Gerald Portal's plan for the settlement of Uganda has at last been published in the *Times*, from which I reproduce the map overleaf. It is curious to see the old world feud between the Protestants and Catholics reproduced in the heart of a savage continent. Sir G. Portal's arrangement gives to the Catholics

about one-quarter of the country which formerly was Protestant. It is impossible here to question the wisdom of an arrangement which has been agreed to by both the contending Churches at the instance of the British Commissioner. The settlement is probably the best attainable. But Uganda is a topsy-turvy land, where ordinary rules seem no longer to prevail. Otherwise how can it be explained that the Church Missionary Society's agents should have demanded that any native changing his religion should forfeit his estates? It does not seem as if these worthy men had much reason to expect many converts to Protestantism. Fortunately the British State, as represented by Sir Gerald Portal, was wiser than the

Anglican missionaries, and liberty of conscience is officially proclaimed throughout Uganda. This settlement of Uganda will probably necessitate sooner or later—probably sooner rather than later—the absorption of the territory of the British East African Company by the British protectorate of Zanzibar. That company having sunk nearly half a million in a gallant attempt to occupy and administer the immense tract of Africa lying between Zanzibar and the Victoria Nyanza, now declare they can no longer carry on under the limitations which prevent them levying taxes on the country which they are expected to govern. The East African Company saved the situation when the future of these territories trembled in the balance, and it is probable that the whole of the

region under their care will soon be absorbed into the British protectorate of Zanzibar.

Prince Bismarck on the Stump.

The Germans have spent a million and a quarter in East Africa without having much to show for it; but German attention at present is occupied with burning questions nearer home. Prince Bismarck, who has been taking

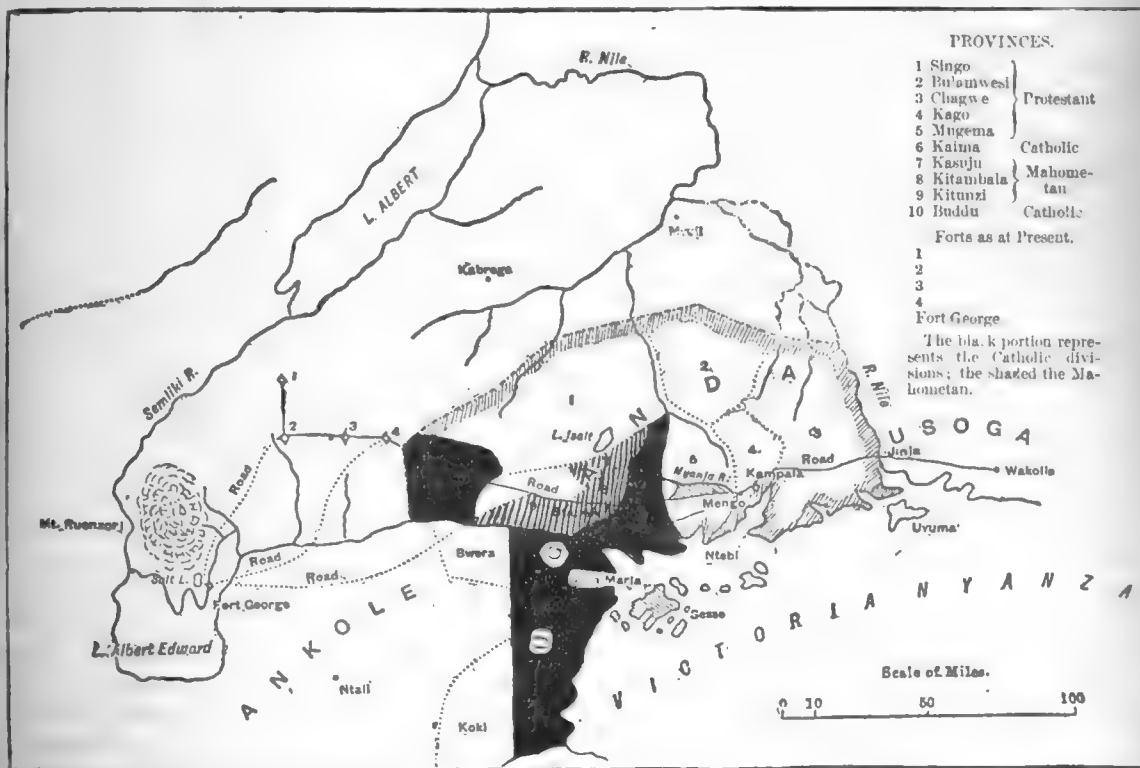

the waters at Kissingen, has been making speech after speech intended to embarrass Count Caprivi, and to excite the alarm of the mediatized states which he embodied under the ægis of Prussia in the German Empire. The Government of Germany, he declares, should be ruled, not by a Chancellor who consults no one but himself and his aide-de-camp, but by the united efforts of twenty-five governments. The Federal Diets ought to interrogate their Ministers as to what they were doing under lock and key in the Federal Council, "just to keep the interest alive." This he indignantly declares is not particularism. It is, on the contrary, particularism of the worst kind to attempt to replace the Imperial by the Prussian Government—"a thing I

should never dream of doing." It is Napoleon at St. Helena over again, with this important difference: that the present-day-vanquished is allowed to grumble and to criticise at large, instead of pouring forth his sorrows to the sympathetic ears of a private secretary.

The death of the Duke of Saxe-Coburg-Gotha, who was the brother of our Prince Albert, removes one of those German Princes whose worth is much better appreciated in the Fatherland than in this country. For its importance arises from the fact that the new

to the Referendum. By the Referendum, the authorities can appeal to the people to vote "Yes" or "No" upon any specific measure. By the Initiative a certain number of private citizens can compel the authorities to submit any proposal which they desire to see carried into effect to a mass vote. The first topic upon which this Initiative was exercised was rather an odd one. The Jews among their many virtues do not include that of the merciful slaughter of animals. It is contrary to the Jewish religion to put an animal out of pain before you cut its throat.

THE NEW TERRITORIAL DIVISION OF UGANDA.

Duke of Saxe-Coburg-Gotha is no other than our own Duke of Edinburgh, who is now a German reigning Prince, and as such, we suppose, will have to take the field or take the sea against France should the long-expected war break out in his time. Another death that occurred last month was that of a very different person—Dr. Charcot, the famous physician of the Salpêtrière, whose death makes one more gap in the rapidly thinning ranks of notable Frenchmen.

One of the most interesting incidents in the history of last month was the first application of the principle of the Initiative in Switzerland. The Initiative is the complement

This offends the German Swiss, and a proposal to forbid the slaughter of all animals which have not been previously stunned, was submitted to a mass vote of the whole of the citizens. In order to carry out such a proposal it was necessary that it should be carried by a majority of cantons as well as by a majority of the citizens. The result was that the proposal was carried by a majority of one canton 11½ voting for prohibition, and 10½ against it. The mass vote was 195,000 to 120,000. It is curious to note that the voting went almost exact, German against French, the German canton of Zurich voting six to one against the Jewish canton of Bern.

slaughter, and the French canton at Geneva voting six to one in favour of it.

Armenia and its Oppressors. The question of the redress of the wrongs of the Armenians has been brought before the attention of the House of Commons and of the British public by representations in the Press. It is satisfactory to find the Government, through Mr. Bryce, recognise their responsibilities in this matter. As a matter of fact we are peculiarly responsible for the prevention of those atrocities with which the Turks from time to time variegated the monotony of their mal-administration. We are responsible first as one of the signatories of the Berlin Treaty, the sixty-first article of which expressly stipulates that the Turks shall govern Armenia decently. Secondly, we are exceptionally responsible because it was owing to Lord Beaconsfield more than any other statesman that the guarantees of the treaty of San Stefano were annulled by the Berlin Congress. Thirdly, we have an explicit and precise obligation under the Anglo-Turkish Convention by virtue of which we "conveyed" Cyprus. Of course we cannot always be re-opening the Eastern Question in order to redress the wrongs of the Armenians, but it would be well if Lord Rosebery and the English Press would endeavour to put a little more pressure upon the Grand Turk. We cannot of course send our ironclads to train their guns upon the Sultan's Palace on the Bosphorus, but Sir C. Ford might be instructed to put a little more pepper into his representations than he would feel justified in doing in default of special instructions to that effect. It is to Russia, however, that the Armenians will really have to look for their protection.

Silver. The action of the Indian Government in closing the mints produced an immediate effect in the United States, where they have been on the verge of a financial crisis owing to the lack of circulating medium. The Silver Act has been now repealed at Washington, and there is a general expectancy all along the line that something is going to happen somewhere, but no one knows where and what. Meantime Mr. W. H. Grenfell felt strongly enough on the subject to resign his seat in the House of Commons rather than support a Ministry which would not be bi-metallic, and Mr. Balfour has gone down to preach the gospel of bi-metallism to the City of London; but so far there has been no sign of grace on the part of the City.

The Bombay Riots. On the 12th of August, Bombay passed through an experience which served as an opportune reminder of the necessity for the strong arm of the British soldier in the midst of the explosive compounds with which our Eastern Magazine is packed. The Prayer Day of the Mohammedans happened to coincide on the 10th of August with the holiday Diewara of the Hindoos. When the Hindoos have a holiday, they beat tomtoms, and the vigorous beating of tomtoms near a Hindoo temple does not conduce to the devotional tranquillity of the worshippers in the adjacent mosques. After standing it for a time, the tomtoming seems to have got upon the nerves of the Mohammedans, and two thousand of them rushed out of one mosque to attack a Hindoo temple. Fierce fighting ensued, and for the next couple of days Bombay was in a state of siege. Thirty-six people were killed, one thousand persons were arrested, nineteen special magistrates were appointed, cavalry, artillery, and gun-boats were held in readiness to reinforce the authorities; but, happily, after two days' effervescence, everything calmed down. There were similar riots in Burma several weeks before, which began there in the killing of a cow, one of the favourite methods by which the Mohammedans outrage the sensibilities of the Hindoos. No one in India ever forgets what is frequently ignored by people at home, namely, that Hindoos and Mohammedans hate each other almost as much as, let us say, the pilgrims of rival Christian creeds who meet at the Holy Sepulchre.

The Labour Question. Parliament being relieved from the pre-occupation of discussing Home Rule, has had an opportunity of considering some other questions which did not exclusively relate to a minority of one-eighth of the inhabitants of the United Kingdom. Among others, it has heard and approved of the Ministerial proposals for improving the condition of workmen employed by the State. This was the idea which Sir John Gorst brought back from Berlin, when he asked: "Why not make the State a model employer?" He was thwarted by his colleagues who had charge of the Spending Departments, but the present Ministry is more amenable to the pressure of the friends of labour. The report of the Royal Commission on labour has not yet appeared, but a very interesting document has been published containing the reports of two Sub-Commissioners on the condition of farm labourers in Ireland. Mr. O'Brien reports that a marked and substantial improvement has taken place within the last ten or fifteen years, the facts being)

perfectly clear and unambiguous. The house accommodation, however, is execrable, and on one point the Commissioners make an observation that may well be taken to heart by those who are considering the question raised by our article on the "Wasted Wealth of King Demos :"—

Whatever be the merits or demerits of landlordism, one cannot fail to be struck by the remarkable contrast between the practical outcome of it in England and in Ireland, respectively, in regard to the habits and condition of the labourers. In most of the English districts visited there were signs of the interest taken by the landlord in the condition of the peasantry—signs that he is using his influence to compel and educate the peasant to take an interest in his own condition. In the Irish districts it was quite the exception to find anything of the kind. Even at the lodges of private mansions there was often as much dirt and disorder as would be found in the meanest hovel.

The Weather.

In England last month the one topic which had precedence over all others was the heat. The

oldest inhabitant can hardly recall such a phenomenal summer as we have enjoyed this year. If only for once in a way, it is well that a nation which governs so many tropical countries should have a taste of tropical heat. When the thermometer is over 90 in the shade, we begin to understand many things that happen in what may be

called the red-hot countries which are quite inconceivable to dwellers in temperate climates. Notwithstanding the intense heat, we have been singularly free from the cholera, and so far the much threatened water famine has not occasioned much distress. The cholera seems to be slower on its legs than it used to be. This year it is prowling around Russia and

Galicja, but the dreaded advance westward is probably postponed until next year.

The Russo-German Tariff War.

The Tariff War between Russia and Germany continues, nor is there any prospect of it abating for at least a month to come. The Germans, being more articulate than the Russians, give more free expression to the sense of inconvenience which this commercial war occasions them. Russia, on the other hand, may suffer more, but, being dumb, says nothing. One of the curious results of this quarrel is that Austria and Russia are drawing

H.H. THE LATE DUKE OF SAXE-COBURG AND GOTHA, K.G.

much more closer together commercially. "It is an ill wind that blows no one any good," and the world could tolerate a temporary inconvenience on the Russo-German frontier if it led to the assuaging of the bitterness which has so long prevailed between Vienna and St. Petersburg.

DIARY FOR AUGUST.

EVENTS OF THE MONTH.

- July 30. Fighting at Rosario, in Argentina.
 31. Close of the International Sanitary and Public Health Congress at Edinburgh.
 Annual Meeting of the British Archaeological Association opened at Winchester.
 Fourth Annual Meeting of the British East Africa Company.
 Foundation Stone of the New Free Library at Southwark laid by Mr. R. K. Causton.
 Demonstration of Miners at Whitehaven.
 The Spanish Budget voted by the Senate.
 Commercial Treaties with Norway and Sweden, Switzerland, and Holland, ratified by the Spanish Senate.
 Aug. 1. Opening of the British Medical Association's Meeting at Newcastle.
 Opening of the Welsh Eisteddfod at Pontypridd.
 The Second Ultimatum accepted by Stum.
 Ecstasy Explosion in Vienna.
 Meeting of the Institution of Mechanical Engineers opened at Middlesbrough.

THE LATE MR. ABEL HEYWOOD.
 (From a photograph by Guttenberg, Manchester.)

2. Resignation of Mr. Grenfell, M.P. for Hereford.
 Close of the Bimetallist League Convention at Chicago.
 4. Shock of Earthquake in the Midland Counties.
 Close of the British Medical Association Meeting at Newcastle.
 The Riots at Bangkok raised.
 Annual Meeting of the Hospitals Association.
 Close of the Naval Manoeuvres.
 5. Demonstration at Liverpool to protest against the Gag in the House of Commons.
 6. Opening of the Corinth Canal.
 Opening of the International Socialist Congress at Zurich.
 End of the Norton Forgeries Trial at Paris; sentences of imprisonment on Norton and Ducret.
 7. Extra Session of the American Congress opened.
 Resignation of De Costa, Governor of Buenos Ayres.

- Boat Accident at Port Talbot, South Wales; 22 lives lost.
 Foresters' High Court at Bristol opened.
 Opening of Shoeburyness Meeting.
 Meeting of Volunteers at Aldershot opened.
 8. President Cleveland's Message read in both Houses of Congress.
 Deputation to Mr. Arnold Morley re the Queens-town Mills.
 9. Parnellite Convention at Dublin.
 New Bank Bill passed by the Italian Senate.
 Close of the Libel Action of Allan Bros. v. Mr. J. H. Wilson and Others; verdict for the plaintiffs.
 10. Close of the Conference of German Finance Ministers at Frankfurt-on-the-Maine.
 11. Religious Riots at Bombay.
 Bill passed by the House of Representatives at Auckland conferring Parliamentary Franchise on Women.
 Release of Tim and Luke Delahunty and Joseph Walker, Irish Prisoners.
 Conference of Inspectors of Weights and Measures.
 Halifax Election Petition dismissed.
 Prince Bismarck presented with an address at Kissingen.
 12. Railway Accident on the Taff Vale Railway; 12 killed.
 Close of the Socialist Congress at Zurich.
 New Cabinet in the Argentine Republic.
 14. International Meeting of Railway Servants at Zurich.
 15. Award of the Tribunal of Arbitration on the Behring Sea Dispute.
 Reports of Serious Floods in Hungary.
 Boating Accident on the Shannon River; 17 lives lost.
 16. Opening of the Anti-Alcohol Congress at the Hague.
 The Constitution passed by the Legislative Assembly of Western Australia.
 Commercial Treaty between Great Britain and Serbia ratified.
 Franco-Italian Labour Riots at Aigues-Mortes; seven killed.
 17. Opening of the Congress of the Association of Sanitary Inspectors at Glasgow.
 Rioting in the Ebbw Valley.
 18. Close of the Anti-Alcohol Congress at the Hague.
 19. Co-operative Festival of the Crystal Palace.
 British Day at the World's Fair.
 20. General Election in France.
 Conflicts between Russian and Finnish Troops in Finland.
 21. Close of the Session of the Serbian Parliament.
 Opening of a New Public Library and a Swimming Bath at Westminster.
 Memorial to Scottish-American Soldiers unveiled at Edinburgh.
 Anti-French Demonstrations in Italy.
 Labour Riot in Vienna.
 22. Special Conference at Westminster on the Miners' Strike.
 News received of a Rising in British East Africa.
 Fighting at Corrientes, in Argentina.
 23. Strike Riots in Naples.
 25. Scotch Deputation to Mr. Gladstone re Disestablishment in Scotland.
 The Proposal for the Separation of the Central Division of Queensland rejected by the Legislative Assembly at Brisbane by 32 to 15 votes.
 26. End of the Socialist Trial at Prague; Seven Men sent to Prison and Eight Acquitted.
 28. Funeral of the Duke of Coburg.
 Unconditional Repeal of the Silver Purchase Law Repeal Bill carried in the United States House of Representatives by 241 to 109.
 29. Meeting of the Coal Owners' Confederation at Westminster Palace Hotel.
 Disastrous Cyclone in America.
 30. Conference of Delegates from Working Men's Clubs, at Holborn, to consider the Clubs Registration Bill.
 Demonstration of Cabmen on the Thames Embankment to discuss their Grievances.

BY-ELECTIONS.

Aug. 8. Mayo (West).—
 Mr. Deasy having resigned, a by-election was held, with the result that Dr. Robert Ambrose, Anti-Parnellite Nationalist, was returned unopposed.
 In 1885: (P) 4,790
 (C) 131
 Parnellite majority 4,659
 In 1886: Mr. Deasy (P) was returned unopposed.

THE LATE DR. CHARCOT.
 (From a photograph by Nadar, Paris.)

	In 1892:	
(N)	3,456
(Independent)	609
Nationalist majority	..	2,847
15. Hereford :—		
Owing to the resignation of Mr. W. H. Grenfell, a by-election was held, with the following result :—		
Mr. Radcliffe Cooke (C)	1,604
Sir Joseph Puley (GL)	1,460
Conservative majority	..	44
In 1885 :	In 1886 :	
(L) 1,360	(C) 1,401	
(C) 1,296	(L) 1,136	
Liberal majority	64	Con. majority 265
In 1892 :		
(L)	1,507	
(C)	1,380	
Liberal majority	..	127

SPEECHES.

July 29. Prof. Jebb, at Cambridge, on the Work of the Universities for the Nation.

Aug. 2. Mrs. Henry Fawcett, at Cambridge, on the Social Progress of Women.

Sir Charles Russell, at Hackney, on the Government.

3. Mr. Balfour, at the Mansion House, on the Currency Question.

Mr. Hayes Fisher, at Wallham Green, on the Affray in the House.

Lord Aberdeen, at Aberdeen, on Canada.

5. Mr. Gladstone, at Islington, on Industry and Art.

Mr. Logan, at Knighton, on the Affray in the House.

7. Lord George Hamilton, at Warwick, on the Home Rule Bill.

11. Sir Richard Temple, at St. James's Hall, on Siam.

12. Sir Henry James, at Sheffield, on the Home Rule Bill.

Mr. Sydney Buxton, at Woolwich, on Trade Unions.

16. Mr. Edward Stanhope, at Rochester, on the Home Rule Bill.

19. Mr. Forwood, at Liverpool, on the Government.

21. Lord Cross, at Workington, on the Home Rule Bill.

22. Prince Bismarck on a Greater Prussia.

24. Duke of Devonshire, at Otley, on the Home Rule Bill.

26. Mr. John Morley, at Newcastle, on the Home Rule Bill.

Mr. Atherley-Jones, at Consett, on the Home Rule Bill.

M. Waddington, at Laon, on the French Government.

Sir John Thompson, at Ottawa, on the Behring Sea Award.

27. Prince Bismarck, at Kissingen, on Prussian Particularism in the Ministry.

PARLIAMENTARY RECORD.

HOUSE OF LORDS.

July 31. Second Reading of the Elementary Education (Blind and Deaf Children) Bill.

Third Reading of the Isolation Hospitals Bill.

Second Reading of the Irish Education Act (1892) Amendment (No. 2) Bill.

Second Reading of the Married Women's Property Act (1882) Amendment Bill.

Aug. 1. The Statute Law Revision (No. 2) Bill passed.

3. Third Reading of the Housing of the Working Classes Act (190) Amendment Bill.

4. Third Reading of the Land Transfer Bill, of the Trust Investment Bill, and of the Conveyance of Mails Bill.

7. Discussion on the Indian Currency Question.

8. Second Reading of the Public Libraries (Ireland) Acts Amendment Bill.

24. Third Reading of the Elementary Education (Blind and Deaf Children) Bill.

28. Second Reading of the Elementary Education (School Attendance) Bill.

Third Reading of the Industrial and Provident Societies Bill and of the Public Works Loans (No. 2) Bill.

29. Second Reading of the Companies (Winding-up) Bill.

Discussion on Higher Education in Wales.

HOUSE OF COMMONS.

July 31. Discussion on the Affray in the House on July 27.

Vote for the Education Department agreed to.

Aug. 1. Civil Service Estimates; Votes for Surveys of the United Kingdom and Public Education in England and Wales.

2. Civil Service Estimates; Discussion on France and Siam; Sir Richard Temple's Motion to reduce the item relating to the Foreign Office discussed and withdrawn.

3. Committee of Supply; Discussions on the Importation of Live Cattle from Canada, and other items.

4. Votes for Civil Service and Revenue Departments, and Discussion on the Administration of Ireland.

7. Report Stage of the Home Rule Bill.

THE LATE MR. JOHN HORNIMAN.

8. Discussion on Canal Tolls and Charges.

Discussion on the Indian Currency Bill.

Report Stage of the Home Rule Bill continued.

9. Report Stage of the Home Rule Bill continued.

10. Consideration of the Lords' Amendments to the London Improvements Bill; Sir John Lubbock's Motion to restore the Betterment Clause carried by 221 to 88.

Amendments to the Home Rule Bill further considered.

11. Report Stage of the Home Rule Bill continued. Third Reading of the Contagious Diseases (Animals) (Swine Fever) Bill.

14. Report Stage of the Home Rule Bill resumed. Third Reading of the Elementary Education (School Attendance) Bill.

15. Report Stage of the Home Rule Bill continued. Second Reading of the Statute Law Revision (No. 2) Bill; of the Copyhold (Consolidation) Bill; of the Trustee (Consolidation) Bill; of the Isolation (Hospitals) Bill; and of the Public Health (London) Act (1891) Amendment Bill.

16. Report Stage of the Home Rule Bill continued. Third Reading of the Shop Hours Act (1892) Amendment (No. 2) Bill.

17. Report Stage of the Home Rule Bill continued.

18. Report Stage of the Home Rule Bill continued.

21. Suspension of the Twelve O'Clock Rule agreed to.

Mr. Gladstone's Closure Resolution agreed to.

22. Report Stage of the Home Rule Bill continued.

23. Report Stage of the Home Rule Bill continued.

24. Report Stage of the Home Rule Bill continued.

25. Report Stage of the Home Rule Bill concluded.

28. Committee on the Navy Estimates; Debate by Mr. Hanbury, Lord George Hamilton, Mr. Forwood, Sir William Harcourt, Mr. Goschen, and others.

29. Committee on the Navy Estimates continued; Sections 1, 2, and 3 agreed to.

30. Third Reading of the Home Rule Bill moved by Mr. Gladstone; Debate by Mr. Gladstone, Mr. Courtney, Mr. Chaplin, and others.

OBITUARY.

Aug. 1. Senator Montgomery, of Nova Scotia, 85.

3. Admiral H. S. Hilyar.

5. Eugène Garraud, actor, 62.

6. Duke de Rohan, 73.

7. James Stillie, Edinburgh bookseller, 89.

Baroness Bolsover, 59.

10. Dowager Marchioness of Huntly.

Miss Gordon.

Dowager Viscountess Miletton, 89.

12. General Sir Edward Hamley, 68.

John Horniman, philanthropist, 89.

14. Bishop Clifford, of Clifton, 59.

Sir Richard Price, Puleston, 79.

Mgr. Leonty, Metropolitan Archbishop of Moscow, 70.

15. Prof. Karl Müller, 75.

Dr. Blanche, 73.

16. Prof. Charcot, 68.

19. Abel Heywood, of Manchester, publisher, 82.

22. Duke, Ernest II., of Saxe-Coburg-Gotha, 75.

Mr. Henry G. G. Cadogan, of Teheran.

Rev. Dr. David Thorburn, 87.

Prince Ibrahim.

23. Lieut.-Gen. James Robert Gibbon, 72.

26. Major-Gen. C. C. Johnston, 75.

27. Bishop Chester of Killaloe and Clonfert.

Colonel F. C. H. Clarke, 51.

The deaths are also announced of Mario Uchard, French novelist, 69; Gen. George Washington Morgan, 72; Thomas Archer, author and journalist, 64; Canon Waile, 84; Miss Lelercq, actress; Dowager Countess of Jersey; William Holloway, of the East India Company, 65; Prof. George Washington Cooke, 79; Constantin von Wurzbach, 45; Jules Havet; Rev. E. J. Selwyn; George Makepeace Towle, author, 52; Major-General J. G. Walker, 71; Jovan Marinovich, formerly Serbian Minister in London; General A. G. Gonzales, 76; Rev. CHARACTER SKETCH.

MR. WALTER BESANT.

A GOOD many years ago, there was a young man of four or five-and-twenty, who ardently desired before all things to become a novelist. He spent a couple of years, giving to the work all his unemployed hours, over a novel of modern life. He took immense pains with it, re-wrote some of the scenes half-a-dozen times, and spared neither labour nor thought to make it as good as he could make it. When he really felt that he could do nothing more with it, he rolled it up and sent it to a friend with the request that he would place it anonymously in Mr. Macmillan's hands. Mr. Macmillan had it carefully read, and sent the author, still through the friend, his reader's opinion. The reader did not sign his opinion, but he was a Cambridge man, a critic of judgment, a man of taste, a kindly man, and he had once been, if he was not still, a mathematician. These things were clearly evident from his handwriting, as well as from the wording of his verdict. This was to the effect that the novel should not be published, for certain reasons which he proceeded to give. But he laid down his objections with very great consideration for the writer, indicating for his encouragement what he considered points of promise, suggesting certain practical rules of construction which had been violated, and showing where ignorance of the art and inexperience of life had caused faults such as to make it most undesirable for the author, as well as impossible for a publisher of standing, to produce the work. The writer, after the first pangs of disappointment, plucked up heart and began to ponder over the lessons contained in that opinion. The young man has since become a novelist."

This passage was written by Mr. Walter Besant in the year 1884, the "young man" of whom he spoke being none other than himself. Concerning the "novel of modern life" to which he referred, one knows nothing. The author forthwith put it behind the grate, resolutely, if with tears. Nor has the name of "the critic of judgment," the "man of taste," the "kindly man," been preserved; he was, and is, a total stranger, even to Mr. Besant himself. All that one knows is that the young man in question persevered, that he was not discouraged by the failure of his first attempt, that he produced more novels, that he was not in a hurry to publish, and that his name is to-day a household word, and his books a delight wherever the English language is spoken or read. For who has not heard of the man who wrote "All in a Garden Fair"?

I.—EARLY YEARS AND EDUCATION.

Charles Dickens was born at Landport, Portsea, in the year 1812. Walter Besant was born at Portsmouth in 1838. At the very outset of this "character sketch,"

therefore, one is impelled to institute a comparison between the two men—between Dickens, the House of Commons reporter who afterwards became a novelist, and Besant, the *Daily News* leader-writer, who also in due time wrote fiction, and who is as popular in his day and in his way, if not as great, as his famous predecessor. But beyond the fact that both men were born at Portsmouth, and that both will be remembered by future generations as novelists, there is little that is common in their careers. Dickens was the son of a clerk in the Navy Pay Office—of a man who is now chiefly remembered for his perpetual pecuniary embarrassments. Besant, on the other hand, was the son of a merchant—of a man in a sufficiently good position to send his three sons to Cambridge. The older novelist was in his early years a poor neglected lad, set to rough, uncongenial work, with no more than a mechanic's surroundings and outlook, one who had to fend for himself in the miry ways of a great city. The younger, who is happily still with us, was carefully nurtured in childhood, had friends in abundance, and received the best education that an English boy can get. Dickens went to no University; Besant took high honours at Cambridge. The former was a mere reporter in the gallery of the House of Commons at an age when the latter was on his way to an English colony to receive and to fill the important University appointment of Senior Professor of Mathematics. But, widely different as were the careers of these two Portsmouth boys in early life, they both became novelists in the end.

MR. BESANT'S HOUSE AT FROGNAL.

THE BOOKS READ BY BESANT WHEN A BOY.

Let us for a moment try to imagine what kind of life it was that young Walter Besant led while living in his father's house at Portsmouth. That he was a bright, clever, and amiable boy is certain; that he was exceedingly fond of reading is equally certain; that he carefully observed both men and things may not be denied. Happily for him, he had in his childhood the run of a collection of books much more extensive and more carefully chosen than was then, or is now, common among middle-class families. It included Shakespeare, Milton, John Bunyan, Dryden, Pope, Addison, "Gulliver's Travels," Goldsmith, Scott, Wordsworth, Byron, Hume and Smollett, Dickens and Marryat. What more can a boy want? Hard indeed to please is he who cannot make himself happy with these authors. There were also in this library, Locke's "Essay on the Human Understanding," Bacon's "Essays" and the "Advancement of Learning," Blair's "Sermons," and other solid works; and there was a great collection of plays, including those of Wycherly and Congreve. All these young Besant

eagerly devoured. That the latter are not books to place in the hands of a boy, he readily admits; but, as he will proceed to inform you, they amused him, though there were quantities of things which he understood not at all. "Tristram Shandy," again, struck him as being full of interest, though one half of it was lost to him. Mr. Besant has always appreciated Charles Lamb's sophistical defence of the comedies of the Restoration on the ground that they belong to a region where there is no morality.

"THE MODERN TRAVELLER."

Among other works read by Mr. Besant in his youth—he began to devour books at the age of ten, and he has continued to do so with equal appetite ever since—was a series of volumes entitled "The Modern Traveller." Each of these volumes contained an account, with pictures, of some country. The reading may have been dull on the whole, but it was lit up from time to time by descriptions of picturesque people and of their manners and customs. He read also a collection of voyages, which included the famous voyage of Commodore Anson, with pictures of the islands of Tinian and Juan Fernandez, and of the ship *Centurion* in action. All this it is important to remember in connection with what the novelist himself has called "the Making of the Man."

"THE PILGRIM'S PROGRESS."

These accounts of travel, stories of voyages, and descriptions of foreign countries had naturally a very direct influence upon the character and the career of the boy who read them. So also did a very different work—"The Pilgrim's Progress." "It seems to me," said Mr. Besant a few years ago, "that this is a book which has influenced the minds of Englishmen more than any other outside the covers of the Bible. While it survives and is read by our boys and girls, two or three great truths will remain deeply burned into the English soul. The first is the personal responsibility of each man; the next is that Christianity does not want, and cannot have, a priest. I confess that the discovery, by later reading, that the so-called Christian priest is a personage borrowed from surrounding superstition, and that the great ecclesiastical structure is entirely built by human hands, filled me with only a deeper gratitude to John Bunyan."

MR. BESANT'S HATRED OF PRIESTHOOD.

Hatred of priesthood in every shape and form has always been a distinguishing characteristic of Mr. Walter Besant. Every man is personally responsible to his Maker: there cannot, in the nature of things, be any human go-between. The great God reigns: he is like a sphere whose centre is everywhere, and circumference nowhere. Priests are often the worst enemies of this sphere: he who is wise will be tied by as few dogmas as may be; and will possess his soul in patience until the end. This, it will be remembered, was the creed of Rabelais; this, to put it very briefly, is the belief of Walter Besant. It is to the early influence of Bunyan that his later attachment to Rabelais is mainly due; and this attachment, which has grown steadily with the years, is responsible for much that is good, wise, and helpful in his teaching.

SHAKESPEARE, MILTON, POPE, AND SCOTT.

The boy read other books. There was "Nicholas Nickleby," for example, a novel "full of tears and of laughter;" there was Shakespeare's "Tempest," a play which he was "never tired of reading"; there was that excellent eighteenth century translation from the Greek, concerning which the great Bentley said, "A very pretty poem, Mr. Pope, but you must not call it Homer"; there

was "Paradise Lost," read, of course, for the sake of the story, a good deal being skipped; and there were the novels of Sir Walter Scott. "I have not read a single one of the 'Waverley Novels' since I was sixteen," remarked Mr. Besant to the present writer a few days ago, "yet I seem to remember them all." And that, as he will tell you at any time, is the grand test of a really good book: that you should remember it.

"THE BOOK OF MAN."

There is yet one more book which the boy began to read—we say *began* advisedly, inasmuch as he is still studying it—and that is the Book of Man. "You may open that Book"—we are using Mr. Besant's own language—"wherever and whenever you find another human voice to answer yours, and another human hand to take in your own. All the books that ever were written are only valuable as they help one to read this Book, and to understand the language in which it is written." Let us pause for a moment to consider what opportunities this boy had at Portsmouth in the far-off "fifties" to look into the Book of Man.

"THE VOICE OF THE PEOPLE."

Do not forget that this lad of twelve or thirteen was the son of a well-to-do merchant; that he had an elder brother who at this time had only just recently been declared Senior Wrangler at Cambridge, and who was a Fellow of St. John's College; and that he had a prescriptive right to mix with the best society to be found in the town of his birth. He did mix with it, of course. But, at the same time, he remembered that there were other pages in the Book of Man as interesting and as attractive as any that he might open in the ordinary way, and that these pages still remained to be read. And for that reason he walked about the streets of his native town, with a view to discovering the Voice of the People.

THE PROPHETS: TENNYSON, CARLYLE, MAURICE, AND KINGSLEY.

And here the phrase "lower classes" recalls to one's mind the fact that Charles Dickens, like Walter Besant, was born at Portsmouth. We have already seen that when quite a boy the latter read "Nicholas Nickleby" and other works by the Master, and there can be little doubt that they had a very important influence in the shaping of his career. In later years, while he was at Cambridge, for example, there were of course other influences. The greater prophets of Walter Besant's undergraduate days were Tennyson, Carlyle, and Maurice. Among the minor prophets was Charles Kingsley. "When the history of the ideas of the nineteenth century comes to be written,"—once again we use Mr. Besant's own words—"it will be recognised that Tennyson contributed to form the national mind far more powerfully than young men can now understand. The influence of Carlyle and Maurice was nothing less than Socialistic. Those who at one-and-twenty pored over 'Sartor Resartus,' 'Past and Present,' and 'Chartism,' became distinctly Socialists—not such gentry as bawl the Gospel of Destruction and break club windows, but Socialists of the highest type, to whom nothing of humanity is common or unclean. Charles Kingsley at his best was filled with this spirit, and I have never read him since my undergraduate days, lest I should have lost anything of my old love for the man who wrote 'Hypatia' and 'Alton Locke.'"

THE BOY'S EDUCATION.

All these things—this reading of books, and these wanderings about Portsmouth town—were in themselves an education, although the boy's friends knew it not; for

they drew out that inborn faculty of observation, and that wonderful power of description to which we owe the novelist of to-day. But his regular education was not neglected. His parents sent him to school—to Portsmouth Grammar School, very likely, or, if not to this, to the Proprietary School at Southsea, where his brother had previously been trained. What manner of life it was that young Besant led while at school may not easily be determined. He must have been more industrious than boys in general are, for he excelled at an early age in mathematics, in languages, and in the study of things theological. But although he himself did excellently at school, it must by no means be rashly assumed that Mr. Besant, the man, approves of the system of education which was prevalent when he was a boy. He would fain have a scheme in which body and mind alike are trained and perfected. He would have, in the first place, the absolute devotion of the tutor to the pupil, so that education should not consist in formal lessons, or in books and school only; he would, in the next place, see that boys were instructed in the arts of riding, dancing, music, singing, gymnastics; he would also take care that they had plenty of work for the hands, that they were gaining an adequate knowledge of manufactures and of industries; and, lastly, he would insist upon an intelligent study of God's glorious works on the earth and in the heavens, and these not singly (which makes a boy unpractical and *doctrinaire*), but in company with others. But what (one asks), if this scheme were adopted, would become of games? There would be no more cricket, and there would be no more football. "It makes one sad and sorry"—these words are Mr. Besant's, and not those of the writer of this article—"to think how glorious a creature a perfectly trained young man might be, and what ignorant, stunted, deformed, under-taught creatures are we who have had the 'best' education of our day."

MATHEMATICIAN AND PRIEST IN EMBRYO.

Young Besant left Portsmouth in order to continue his studies at King's College, London, and it was from that institution that he proceeded to Cambridge. It was while he was at King's College, by the way, that some verses by Trench of Dublin appeared in the *Times* on the subject of the battle of Alma, which had recently been fought. The professor of classics asked the students to turn them into Latin. They all did so, and it was Besant's version that the professor selected to send to Trench. Upon leaving King's College, he went to Christ's, at Cambridge, and ere long won a reputation for his great skill in mathematics, and for his attainments in theology and the studies that are therewith connected. His elder brother, William Henry, had already graduated at Cambridge as Senior Wrangler, and as First Smith's Prizeman. There is, therefore, nothing so very remarkable after all in the fact that the subject of this "Character Sketch" should exhibit a great taste for mathematical studies; and, remembering that another of his brothers is a clergyman, one can also understand his early liking for theology.

THE FETTER OF THE WHITE TIE.

There was a time, indeed, when it was thought, and hoped, that Walter Besant would become a clergyman. But, fortunately for the world and fortunately for himself, he mapped out for himself another sort of career. And thus, as he will smilingly inform you, "the Church escaped one more unworthy clergyman, and I escaped what would have been to me the intolerable fetter of the white tie." But would this fetter have really been so intolerable as Mr. Besant thinks? Charles Kingsley wore it through the greater part of a lifetime, yet Charles

Kingsley breathed always in an atmosphere of intellectual freedom, and wrote novels as outspoken and as manly as any that have been produced by Mr. Besant. Mr. Baring Gould, again, is a clergyman; nevertheless, he is perpetually penning stories, and no man gets up to say him nay. Walter Besant, had he become a clergyman, would in all probability have proved a pillar of orthodoxy: he would never have ceased to defend the Church, inasmuch as he would have felt that in no other establishment of the kind was any relief from the fetters of doctrine possible, and inasmuch as the main things which underlie Articles are common to all churches in which dogmas are the accidents of time and of circumstance. But it is idle to speculate what the author of "All Sorts and Conditions of Men" might have become had he decided to use permanently the word "Reverend" before his name. He chose what was doubtless for him the better part—an appointment in the colonies. He went as Senior Professor of Mathematics to the Royal College in the island of Mauritius.

LIFE IN THE MAURITIUS.

Mr. Besant stayed in the Mauritius for six and a-half years, at the expiration of which time he returned to England on leave of absence. One or two attacks of fever had warned him that a change of residence was imperatively necessary, and he was, moreover, anxious to see his relatives and friends, and to re-visit the scenes of his youth. After more than six years of Mauritius—which, although a nice place, is decidedly dull—a man may be forgiven for feeling a little homesick. It happened in Mr. Besant's case as it has happened in many others, that after a few months of England he did not care in the least to return again to Mauritius. He accordingly made up his mind to stay at home, and although he was offered the post of Rector of the College in which he had been Senior Professor of Mathematics, he steadfastly refused to go back to Africa, and determined to earn his bread in his native land. Those who are curious to know what sort of place the island of Mauritius is, and what manner of life is led there by the inhabitants, will do well to turn up a certain story by Mr. Besant called "They Were Married." In this story the island is described under the name of Palmiste, and the characters—every man, woman, boy, and girl included among the *dramatis personæ*—are drawn from real life. Mr. Besant's home in the Pacific has also been described by him in "My Little Girl."

II.—JOURNALIST, CRITIC, AND HISTORIAN.

This, then, was the fashion in which the first chapter of Mr. Walter Besant's life came to an end. He was now back in London once more—a young man of seven or eight and twenty, clever, cultured, energetic. He had to face that Problem which we most of us have to face: he had to discover the means whereby he might earn sufficient money to secure the necessities of life and such luxuries as should seem to him to be indispensable. It was at this time that he turned to literature.

THE DAY OF SMALL THINGS.

But not in the stupid fashion that has always been so common. He did not write a story, or a poem, or a play, and expect forthwith to obtain riches, fame, and position. He had written a novel, it is true, but he did not fervently believe it to be an unsurpassable work of genius, and therefore rail at those who were unable to discern and appreciate its wonderful merits. When Mr. Macmillan sent his first book back with the unfavourable verdict of the mathematician who had "read" it—was this

ly critic of Walter Besant Mr. Dodson we wonder: the author of "Alice in Wonderland" and other delightful books?—he burned it. Mr. Besant entered the field of letters as many another distinguished man has entered—as Dickens entered it, to quote a single example only—by way of the Gate of Journalism. He wrote at first for the smaller magazines—for *Once a Week* and similar publications—then for *Temple Bar* and other more ambitious periodicals. Daily journalism next claimed his attention, and he was fortunate enough in the end to get an appointment as leader-writer on the staff of the *Daily News*—on the paper that had been started by Charles Dickens when Besant was a boy of eight.

JOURNALISM A CLOSE PROFESSION.

"It is well known," remarked Mr. Besant some ten years ago, "that it is an extremely difficult thing for a man to force his way into the upper ranks of journalism. There are, to begin with, so many men before him—perhaps men as good; certainly men who have been trained in a sharp, practical school, who know the lobbies, who are behind the scenes, and can write articles that are full of hidden meanings, suppressions, and hints to those who know. Journalism has become a close profession into which a man must enter early and make of it the business of a life."

Perhaps the profession was less "close" in 1868 than in 1883. At any rate, Besant, as we have already noted, did force his way into the upper ranks. He wrote social leaders—"they would not trust me with politics." Generally, he received his instructions from the Editor—Mr. Hill—in the morning about eleven, wrote his article in the course of the day, sent it down to the office, corrected a proof in the evening, and so got home early to his suburban residence at Shepherd's Bush. Mr. Besant was at this time secretary to the Palestine Exploration Fund—he was appointed to the post, by the way, in 1867—but the duties of his office though arduous left him time for journalistic work. It was only when a new rule came into force at the *Daily News*, and that subjects were not given out until the afternoon, that his final severance from daily journalism took place. This was in 1874.

THE WORK OF A LEADER-WRITER.

If his work in any way resembled Professor Palmer's, Besant must at this time have been an exceedingly busy man. "It is fatiguing work"—so he said in the "Life" of the Orientalist, which he wrote in 1883—"one has to be always ready to produce an intelligent and pleasant article, taking the right view on any subject which may occur. Sometimes there are no subjects, then one must be invented. Sometimes, when the work has been already half completed, a telegram comes in which alters the aspect of the case, or presents a new subject of paramount importance. Then all has to be begun again, with the boy standing at your elbow to snatch the slips as they are completed, and carry them off with the ink still wet to the compositors." But it was work which Mr. Besant liked, and he gave it up only because it interfered with his domestic arrangements, and because it meant for him what was practically an interminably long day. Mr. Hill, as we may imagine, was exceedingly sorry to lose the services of so able a contributor. For young Besant was a brilliant writer, he had a rich fund of shrewd sense, his mathematical training had made him careful and methodical, he was a studious and alert observer who had seen foreign countries, and who had mixed with all sorts and conditions of men, he was a scholar and a gentleman,

and, above all, he could be depended upon. His copy was never late; what he undertook to write he wrote promptly, quickly, and well. It is not every newspaper man of whom the same can with equal truth be said.

THE STUDY OF OLD FRENCH.

While professor in the Mauritius, Mr. Besant made the acquaintance of a scholarly Frenchman, one Léon Doyen. He it was who introduced him to the beauties of old French literature, and especially to the beauties of old French poetry. Now, in order rightly to appreciate these beauties, it is essential that one should be able to read old French, which is a language that bears about the same relation to modern French as does so-called Anglo-Saxon to the tongue spoken by Englishmen to-day. Mr. Besant mastered old French, and studied the literature to which it was the key. But though very delightful—this, by the way, is a point which Mr. Besant is most enthusiastic on—it is neither popular nor lucrative. Hence when he published a book on the subject—Mr. Macmillan was the publisher, and the system adopted was that known as "half profits"—he found that so far from bringing him money, the work, a very considerable volume, scarcely did more than pay its expenses. Indeed, the most ordinary journalist of to-day gets as much for a single paragraph as Mr. Besant—an authority upon the subject, a scholar, a practised writer, and a man thirty years of age—eventually secured for "Studies in Early French Poetry."

MR. BESANT'S FIRST BOOK.

"Studies in Early French Poetry" is a distinctly interesting book, though its interest for us to-day is mainly extrinsic in character. There is a copy of it to be seen at the British Museum, and they have one at the London Library, in the catalogue of which it is attributed, curiously enough, to one Wm. Besant. The only other work entered under Besant in this huge volume—we are speaking of the fourth edition, the catalogue of 1875—is "Jerusalem, the City of Herod and Saladin"—a history written by him in collaboration with the Professor Palmer to whom we have already referred. The edition printed of the "Studies" was not a large one—Mr. Macmillan and Mr. Besant divided just eleven shillings and sixpence between them over it—and the copies purchased by the public are now, like the graves of Felicia Hemans's happy family, "scattered far and wide, by mountain, stream, and sea." You cannot buy the work at any bookseller's shop, except, perchance, in that of a dealer in second-hand books.

A GOOD PUBLISHER TO BEGIN WITH.

What, it will be asked, did Mr. Besant gain by publishing this volume of "Studies"; what advantage resulted in the end from the putting before the world of a book from which neither he nor the publisher got anything like an adequate return in money? The answer to this question is a simple one. He gained much. For, as he told a young man who a few years ago was complaining about the paltry ten pounds paid to him for a volume which had occupied the whole of his leisure time for one year, it is a great thing for a beginner to get his first book accepted by a good publisher. Such a publisher brings it out in a worthy form—the credit of his house compels him to do so; he advertises it, with a view to ensuring a sale; it is reviewed on every hand, because editors know that a good publisher would not send them rubbish; the author is talked about in the papers, and among people interested in books; in a word, he gets what the beginner chiefly wants—he gets an advertisement. Therefore no greater fortune can befall a young author than to have

an early work accepted by Mr. John Murray, by Messrs. Macmillan, or by the Longmans. It afterwards rests with him whether he makes a spoon or spoils his horn.

THE TEACHING OF LANGUAGES.

It is scarcely necessary to remark that Mr. Besant is an excellent French scholar. Once, indeed—it is a good many years ago now—he prepared a sort of French grammar—a “Book of French” it was called, if we remember rightly. Similarly, Mr. Austin Dobson, whose name now suggests nothing beyond *vers de société* and the eighteenth century, once wrote a small manual of English literature—a cram-book for students anxious to join the Civil Service to which he himself belonged. Let us pause for a moment to ask Mr. Besant how the French language may best be taught. “The first thing you want in a language is the vocabulary”—so we are informed by him in “All in a Garden Fair,” which novel, by the way, may be regarded as a sort of informal autobiography—“men who learn many languages begin after the manner of Adam, with the names, not after the manner of the schoolmaster, with the syntax. Those who do not want to learn a language begin with grammar and exercises; this is the way of our schools, and it is the cause of our brilliant success in modern languages.” The former was the way in which Hector Philipon, the kindly French master of “All in a Garden Fair,” taught his two *protégés*, Allen Engledew and Will Massey. “There was no regular teaching; he sat and listened while they talked and read. One may remark that, if he had adopted the method at his school, the girls whom he taught would have really learned French, but he was expected to follow the lines to which his employer was accustomed. That is to say, he read Racine to the girls, and made them write exercises on the experiences of the watchmaker’s aunt and the gardener’s grandfather. Therefore the girls did not learn French at all, and the boys did, though they wrote no exercises at all and knew nothing of the gardener’s grandfather.” The folly and the futility of our present system of teaching modern languages have seldom been exposed more happily or more effectively than in that most delightful novel “All in a Garden Fair.”

THE FRENCH HUMOURISTS.

Five years after the publication of “Studies in Early French Poetry”—in the late summer of 1873—Mr. Besant gave the world a work on the French humourists. It was published by Bentley, and the author was described upon the title-page as M.A., as member of Christ’s College, Cambridge, and as the writer of the “Studies,” to which we have already referred. The preface was penned at the Savile Club—then, as now, one of the centres of intellectual activity in the Metropolis. It is clear, therefore, that at this time Besant, an erstwhile Professor in a Colonial College, the secretary of the Palestine Exploration Fund, and a journalist, had won a fairly good position for himself in the world of letters. Note the fact that he was now thirty-five years old. Note also the fact that in about a year or more he married.

“A VERY TIGHT TIME.”

The date of Mr. Besant’s marriage is always connected in his mind with what he calls “a very tight time” at the Palestine Exploration Fund. It was in the autumn of the year 1874, when the Society had two parties in the field, that of Captain Conder, which drew £200 a month, and that of Mr. Clermont Ganneau, which drew £100 a month. They had got through the summer with great difficulty; and at the beginning of October Besant found

himself with a very small balance at the bank, and with bills about to come in. He applied to his usual resource, the honorary secretaries, but unfortunately nearly all of them were away for their holidays. While he waited for their answers, the expected bills arrived. The treasurer of the Society, to whom he would naturally have gone, was, like the honorary secretaries, out of England. Mr. Besant had therefore to go round among such of the committee as were left in London, and to get advances. Somehow, but with the greatest difficulty, they managed to raise the money to meet the bills. It really seemed at one time that it would be impossible for him to keep his engagement to meet at the altar the lady who was to become Mrs. Walter Besant. Happily, the bills once met, he was able to present himself at the proper place and time. Only the honeymoon had to be cut down to one week.

AN “APPRECIATION” OF RABELAIS.

Pursuing the somewhat zigzag course of this narrative, one has now to revert again to Mr. Besant’s book on the French humourists. This work contains an article on Rabelais—a very remarkable article, when we consider the reputation which the Curé de Meudon has in the main enjoyed in this country. “Beast-man” is the epithet applied to him by a well-known writer, a man whose sincerity is beyond doubt; “a great moral teacher” is the phrase used by Mr. Besant. And this admiration for Rabelais, and this appreciation of his worth, have grown with the growing years. While admitting in 1873 that Rabelais was a teacher the like of whom Europe had not seen, he went on to remark that “it would have been better for France if his book tied to a millstone had been hurled into the sea.” Not on account of the indecency which mars it—that, Mr. Besant, one of the purest-minded of men, regards as nothing—for the filth and dirt of Rabelais do not take hold of the mind, a little cold water washes all off; but “because he destroyed effectually, perhaps for centuries yet to come, earnestness in France.” “Great and noble as are many of the passages in Rabelais”—these were Mr. Besant’s words in 1873—“profoundly wise as he was, I do believe that no writer who ever lived has inflicted such lasting injury on his country.” We hear little or nothing of this charge in the book on Rabelais which Mr. Besant wrote for Messrs. Blackwood a few years later, or in the “Readings” which that firm published for him in 1883. Further acquaintance with the great humourist’s works had had the effect of causing a certain blindness to their faults, and of increasing his kindness towards their virtues. Whether Besant’s verdict be right or wrong, he has certainly done a great deal for Rabelais in this country; and it is equally certain that Rabelais has had a very profound influence upon the novelist himself. It came too late in life greatly to affect his character as a man, but that it shows itself in his writings is clear beyond all dispute. Those who would like to know what manner of man Rabelais was cannot do better than refer to the little monograph already mentioned; those who desire to make some acquaintance with his works should purchase the “Readings,” which Mr. Besant edited in 1883. Either work may be placed in the hands of a woman, or even in the hands of a boy. The same may not be said of the original French or of Urquhart’s translation from it.

HISTORICAL WRITINGS.

It will be observed that Mr. Besant began his literary career by writing criticisms, not by producing creative work. He was for a time, indeed, that *bête noire* of Mr.

James Anthony Froude, a "modern critic." "In criticism," says Mr. Froude somewhere (we quote from memory), "there is a curious inversion of the rule which holds with ordinary employments. The aspirant to literary fame begins upon the Bench, and when he has served a term of apprenticeship there, descends to the Bar and practices on his own account." Besant presently became something more than a critic; he wrote, in collaboration with Professor Palmer, a "History of Jerusalem"—a standard work if we mistake not—he wrote some years later (again in collaboration) a popular account of the beginnings and growth of Constantinople. His recently published work on London is, of course, in everybody's hands; this account of social England as it was fifty years ago, which appeared in Jubilee year, is no doubt equally well known. There are, moreover, his historical novels—"Dorothy Forster," "The World Went Very Well Then," "For Faith and Freedom," "St. Katherine's by the Tower," and others—all books of historical interest and value (although regarded generally as works of fiction), and purchasable in yellow covers at the bookstalls for two shillings a piece. Of these historical novels more shall be said later on; enough has been written here to justify the word "historian" at the commencement of the chapter which we now bring to a close.

III.—NOVELIST.

Besant and Rice! How pleasantly familiar is this collocation of names, and what delightful memories the sound of it brings to one's mind! Dick Mortiboy, "Cardiff Jack," Gilead P. Beck, the Captain.

Mr. Lucraft, Stephen Cobbledick—a whole gallery of characters, every one of which stands out distinct and individual, is recalled by a mere mention of the name of this well-known firm. Twelve books: that is the sum of their achievement. You may buy them in any shop—in yellow covers they will cost you two shillings each, bound in cloth they will run to three-and-six—or Messrs. Chatto and Windus can let you have them all in the form of a library edition at six shillings per volume. It is easy, therefore, to make acquaintance with the works of Besant and Rice.

JAMES RICE.

And who, it will be asked, was Rice? The question is not altogether an easy one to answer. James Rice, who is now dead, is remembered chiefly as joint author with Besant of the wonderful series of novels to which we have just referred. He was a University man; he left Queen's College, Cambridge, in the year 1867; he then entered at the Temple with a view to practising at the Bar; he next bought an unlucky journal called *Once a Week*, which, for a while, he published and edited; he eventually made the acquaintance of Besant, and the

two men wrote novels together; and he died in 1882. This is about all that can be discovered concerning James Rice.

BESANT'S INTRODUCTION TO HIM.

There is scarcely another instance in the whole history of fiction of a partnership carried on so continuously, so amicably, and so successfully as that of Besant and Rice. The two men met each other in the year 1868, and their meeting came about in this wise. Mr. Besant—at that time a journalistic free lance—sent to the editor of *Once a Week* a paper containing an account of a visit to the Island of Réunion and an ascent of the Piton de Neige, the highest peak on the island. For a time he heard nothing, and he was wondering whether he should write and get the article back, when he discovered that it had already appeared. To his intense annoyance he found that it was full of the most exasperating mistakes—not a single proper name in it was spelt correctly, there were numerous "literals," there was, in a word,

everything that is calculated to make an author swear. Mr. Besant swore accordingly. "What does this mean?" he asked: "why do you, the editor of a popular journal, print an article of mine without first giving me a chance of correcting the proofs?" "Come and see me," was the reply—a reply written in a strange handwriting and signed with a name unfamiliar to Mr. Besant—with the name of James Rice.

EXPLANATIONS.

The two men met at the office of *Once a Week*, a room in Tavistock Street. James Rice explained that he had

JAMES RICE.

just bought the paper; that he had found, among other matter in type and passed for press, the article in question; that the author's name did not appear upon it, and that he was not aware of its being uncorrected. Mr. Besant was satisfied with the editor's explanation, and so, it would seem, was the editor with the article which had elicited it, for he at once asked his contributor to send other things—sketches, notes of travel, notes on literature, essays, whatever he liked, in fact—promising, as a sensible editor always does, to consider them, but not, be it observed, guaranteeing insertion. Mr. Besant acceded to Rice's request. He called at the office of *Once a Week* from time to time, bringing with him a contribution, and remaining for a talk. This sort of thing went on for more than two years—that is to say until 1871, when the partnership proper began. As the story of the partnership was told by Mr. Besant himself so recently in the *Idler* it is hardly necessary to repeat it here.

CONCERNING COLLABORATION.

Their ten years' continuous labour was undisturbed by the least jar or disagreement: they worked with perfect accord and without the least difference of opinion. Some foolish newspaper man, anxious, we will charitably assume, to get up a mild sensation, stated a few years ago that a good deal of "All Sorts and Conditions of Men" was written by Rice, and that his partner had taken all the glory to himself. This, in spite of the fact that Mr. Besant assumes in his preface to the story "the sole responsibility of the work, for good or bad." But then this journalist did not know Walter Besant.

It may be remarked finally that the surviving partner in the concern does not, in spite of its success, greatly recommend collaboration. Why, one knows not; but a similar thing has been observed at times among persons who have engaged themselves in another sort of partnership. There are men, and women too for the matter of that, who, though happily married, do not persuade their friends to enter wedlock. Perhaps they are of opinion that the disadvantages outweigh the advantages even in the most perfect of unions; perhaps their own is such an ideal one that they question the possibility of another like it ever being made.

THE WORK OF THE SURVIVING PARTNER.

In the case of Besant and Rice, the surviving partner carried on the business of the firm alone. He has so carried it on for more than ten years. These years have been the most prolific in his life. He wrote twelve books when in collaboration; he has produced seventeen since his collaborator died. Here is a list of them:—"All Sorts and Conditions of Men," "The Captain's Room, etc.," "All in a Garden Fair," "Dorothy Forster," "Uncle Jack, etc.," "The World Went Very Well Then," "Children of Gibeon," "Herr Paulus," "For Faith and Freedom," "To Call Her Mine," "The Bell of St. Paul's," "The Holy Rose," "Armored of Lyonesse," "St. Katherine's by the Tower," "Verbena Camellia Stephanotis, etc.," "The Ivory Gate," and "The Rebel Queen." The titles of three of these books conclude with an "etc.," this means that each of them contains a number of short stories—three or four as a rule. Now these seventeen books fall into three categories. There are, in the first place, the historical novels, books dealing mainly with English life in the seventeenth and eighteenth centuries—such are "Dorothy Forster," "The World Went Very Well Then," "For Faith and Freedom," "The Holy Rose," and "St. Katherine's by the Tower." The second category contains those books which were written with some distinct purpose in view—"All Sorts

and Conditions of Men" and "The Children of Gibeon," for example. The third, and the larger one, includes the "romances of to-day."

THE EIGHTEENTH CENTURY.

"What, first of all, made you take so great an interest in the eighteenth century, Mr. Besant?" This question was put to him a few days ago. "Truly, I know not," the novelist replied; "except that it was the reading of Fielding, of Smollett, and of Defoe. It is a most interesting period, however, and one that naturally appeals to the storyteller, inasmuch as it possesses all the elements of the picturesque, and allows one to put in as much incident as one pleases." It will, perchance, be urged by some that since the novelist ought never to go beyond his own experience—this is Mr. Besant's own rule, by the way, and a very safe one it is—the historical novel in general, and his own historical novels in particular, have no *raison d'être*. "This is by no means the case," he will reply; "the interest of the historical novel, as of any other novel, depends upon the experience and knowledge which the writer has of humanity, men and women being pretty much alike in all ages. When the historical novelist has occasion to describe, he must borrow. And, of course, he will go not so much to the poets, the divines, the historians of the time which he desires to reproduce, as to the familiar writings, the letters, comedies, tales, essayists, and newspapers."

"DOROTHY FORSTER."

This is a favourite theory of Besant's: we will see how he carried it out in the writing of his finest historical novel "Dorothy Forster," a book which, according to many, is the best thing of its kind that has appeared in this country since the publication of "Esmond" in 1852. It deals with the history of the unfortunate Earl of Derwentwater—he who led the brief but romantic Northumbrian rebellion in 1715. Mr. Besant mastered first of all the history of that rebellion. Then he studied carefully from printed books and from manuscript records the story of the family concerning which he had decided to write. Next he made four journeys to Northumberland, walked from end to end of the county, and saw everything there is to be seen in it. All this had to be done before he could put pen to paper, so to speak. As to the manners of the people in the early eighteenth century and their language—these things he had learnt already by the perusal of endless volumes written during the period which he had to reproduce. And here it may be well to note that it was not the essays of Addison and of Steele that he found the most valuable to him, but the writings of smaller men, of hacks it may be, of those who, not being artists, failed to exercise the faculty of selection, and so left a rich store of materials behind them for the future historian or novelist to use. It was for this reason that Mr. Besant so warmly recommended a little volume of selections from the *Athenian Oracle*, which the present writer published some eighteen months ago, describing it—the original work, we mean, not the reprint—as a "treasury, a storehouse" of information, covered the period in question. The four scrubby volumes of the *Oracle* occupy an honoured place in Mr. Besant's library at Froggnal End. Near them are *The British Apollo* and the works of Tom Brown, Ned Ward, Tom D'Urfey, and other eighteenth-century scribblers, whose writings are richer in amusement than in edification.

"FOR FAITH AND FREEDOM."

Take another of the historical novels—"For Faith and Freedom." This is a story of the days of Charles II. and of his brother James. There is in this tale a wonderful

description of slavery as it was in the Island of Barbadoes at the end of the seventeenth century. Now Mr. Besant himself has laid it down as one of the rules of the Art of Fiction that it is impossible to describe what you have not seen; so that if you are going to describe a house, a piece of scenery, a country, you must go there and describe it from personal knowledge (as he did Northumberland in the case of "Dorothy Forster")—or, at least, from the personal knowledge of some one who will describe it for you. How then did he manage in the case of Barbadoes at the end of the seventeenth century? In this fashion. Happening one day to look through the catalogue of a second-hand bookseller—he reads these lists as regularly and as religiously as he reads the *Times*—he saw just what he wanted, a contemporary account of the very place and the very thing he was so anxious to describe. Off he went to the bookseller in question, only to find, to his great disappointment, that the pamphlet had already been disposed of. There was nothing to do but to institute a search at the British Museum. He employed a man to seek the precious brochure there, and in about three weeks (it is not easy to find a thing of this sort at Bloomsbury) the man found it. It was promptly transcribed, and having passed through the alembic of the novelist's brain, re-appeared in the pathetic, grim, vivid piece of writing to which we have referred.

IN SEARCH OF THE VOICE OF THE PEOPLE.

Mr. Besant has always taken the keenest interest in all matters which concern the poor. They are the People whose Voice he sought while yet a boy at Portsmouth. He was at that time not only enthusiastic over Dickens, but also on terms of great friendship with a retired naval captain, who made it the business of his life to pick up waifs and strays and to make men of them. Should any reader desire to become acquainted with this most excellent man, he will do well to turn to "By Celia's Arbour," for "the Captain" in that book is drawn from life. But although his thoughts concerning the People, as he calls them, have always been warmly sympathetic, it was not until the year 1882 that he began to take a really active interest in their welfare. He had at that time just discovered "the great and marvellous unknown country" called East London. He had wandered in Stepney, Whitechapel, Poplar, St. George's-in-the-East, Limehouse, Bow, Stratford, and Shadwell; he had discovered Rotherhithe, a place which he afterwards explored with carefulness; he had found out Charrington's great brewery in the Mile End Road; he had come across many wonderful things, and had conversed with many wonderful people. In the end he wrote "All Sorts and Conditions of Men: an Impossible Story"—his most popular work. Everybody has heard of it, and everybody knows that it was the Palace of Delight described in its pages which gave the idea of the People's Palace, now an accomplished fact. True, the real Palace is not what its prototype was: but then it is no easy matter to translate the dreams of the romancer into the hard facts of every-day life. That an attempt should be made to translate them at all in this prosaic, practical nineteenth century England of ours is a wonderful thing—far away the most wonderful that has ever happened in the history of the English novel. The People's Palace, whether it in the end prove a success or a failure, is beyond all question the creation of Walter Besant.

"CHILDREN OF GIBEON."

Leaving social questions alone for a while, Mr. Besant turned his attention to some that are connected with litera-

ture, and followed up "All Sorts" by "All in a Garden Fair." (Nobody but Mr. Swinburne, by the way, is greatly concerned at Mr. Besant's amiable weakness for long titles.) Then he made an excursion into the eighteenth century, writing "Dorothy Forster" and a few short stories; after which he took up another burning social question—the condition of industrial women—and dealt with it in a book which he called "Children of Gibeon." In an age when not one person in a hundred (a thousand would perhaps not be wide of the mark) is able to say whence Sir Frederic Leighton took the subject of "Rizpah," his chief Academy picture this year, it may be useful to point out that the Children of Gibeon (not Gideon, as it is called by some) were a tribe condemned by Joshua to perpetual bondage—to be "hewers of wood and drawers of water for the congregation." Their story will be found in the ninth chapter of the Book of Joshua. Mr. Besant knew—it was, and is alas! certain beyond peradventure—that in all our back streets there are hundreds and thousands of women who are continually occupied in working out life-long sentences of toil, compared to which the tasks of the Egyptians were light, and the daily labour imposed by the slaveowner was merciful; toil coupled with miserable pay, chiefly absorbed in satisfying the rent collector, insufficient food, and deprivation of all that makes life tolerable, not to say happy. This terrible life-sentence, from which there is no escape and of which there is no mitigation, is pronounced upon these poor women at their birth: it is their punishment for the crime of being born. They have been condemned unjustly—not justly, as were the Children of Gibeon—to perpetual bondage. All this, we say, Mr. Besant knew, and knowing it, he seized that picturesque pen which he had once before wielded to such excellent purpose and wrote "The Children of Gibeon." Buy it and read it, if you have not already done so. It is in its way as fine a piece of work as "All Sorts and Conditions of Men." Like that story also it is a Philanthropic or Purposeful Novel. Unfortunately, it has so far failed in its purpose.

THE ART OF FICTION.

To discuss the merits and demerits of Mr. Besant's stories of modern life, of his "romances of to-day," is impossible within the limits that have been assigned to us. Instead of criticising them, therefore, we propose to say something about his attitude towards fiction in general, and his views upon the art of which he is so admirable a master.

For note this thing: Mr. Besant insists, in season and out of season, upon the fact that fiction is an art; that, although a novel by Meredith may not be so great and wonderful as a cartoon by Raphael or as a sonata by Beethoven, yet fiction being one art, and painting and music other and sister arts, those who attain the highest possible place in each are equal. But even if fiction be an art, the rules of which are teachable, it by no means follows that success can be secured without the inborn genius which every true novelist possesses. The storyteller must have the gift of observation; he must acquire the art of description; he must exercise suppression and reticence; his characters must be drawn clearly; he must strive without ceasing to attain style. No reputation worth having can be made without attending to style, and there is no style, however rugged, which cannot be made beautiful by attention and pains. He to whom style is not a matter of indifference will, no doubt, be interested to read the following extr-

from a letter, which was written by Mr. Besant to a literary aspirant—a lawyer's clerk in a little country town—seven or eight years ago :

As regards style, it will be a long time before you acquire one of your own. But go on. Write every day something, and read only the best authors—Thackeray, of course, is one of the best. Kingsley also I would recommend. Scott, also, of course. You should also read George Meredith, who is a great artist, though he wants tenderness.

And he or she who is anxious to become a novelist may care to read the following rules which Mr. Besant drew up and published a few years ago. It is a *Hendecalogue*, no commandment in which ought on any account to be broken.

1. Practise writing something original every day.
2. Cultivate the habit of observation.
3. Work regularly at certain hours.
4. Read no rubbish.
5. Aim at the formation of style.
6. Endeavour to be dramatic.
7. A great element of dramatic skill is selection.
8. Avoid the sin of writing about a character.
9. Never attempt to describe any kind of life except that with which you are familiar.
10. Learn as much as you can about men and women.
11. For the sake of forming a good natural style, and acquiring command of language, write poetry.

At this point we are compelled reluctantly to bid farewell to Mr. Besant the novelist.

IV.—POET AND PLAYWRIGHT.

Poet? say you. Yes; poet. There can be no question about it. It is true that Mr. Besant has never published one single volume of verse, but there are to be found scattered up and down his many novels gems in every respect worthy of their beautiful setting. The best proof of our contention that Besant is a poet will be found in the reading of a few of these fugitive pieces. Take, then, this song from "Dorothy Forster":—

DAPHNE.

Like apple-blossom, white and red;
Like hues of dawn, which fly too soon;
Like bloom of peach, so softly spread;
Like thorn of May and rose of June—
Oh, sweet! oh, fair! beyond compare,
Are Daphne's cheeks,
Are Daphne's blushing cheeks, I swear.
That pretty rose, which comes and goes,
Like April sunshine in the sky,
I can command it when I choose—
See how it rises if I cry,
Oh, sweet! oh, fair! beyond compare,
Are Daphne's cheeks,
Are Daphne's blushing cheeks, I swear.
Ah! when it lies round lips and eyes,
And fades away, again to spring.
No lover, sure, could ask for more
Than still to cry, and still to sing:
Oh, sweet! oh, fair! beyond compare,
Are Daphne's cheeks,
Are Daphne's blushing cheeks, I swear.

Or take these neatly turned stanzas, also from "Dorothy Forster":—

THE USE OF THE FAN.

Learn, nymphs, from wondrous Daphne's art
The uses of the fan,
Designed to play a potent part
When she undoes a man.
As when the silly trout discerns
The artificial fly,

And rises, bites, and too late learns
The hook that lies hard by;
So man, before whose raptured gaze
The fan in Daphne's arms,
Now spreads, now shuts, and now displays,
And now conceals her charms,
Falls, like that silly fish, a prey,
Yet, happier far than he,
Adores the hand outstretched to slay
And dies in ecstacy.

Or take, finally, this ballade, which forms part of "Monks of Thelema":—

"BETTER HAVE LET LOVE'S EYES GO FREE."
Love goes singing along the way;
"Men have blinded and covered my eyes;
I have no night and I have no day.
Dark is the road and black the skies."
Then Love laughs and fleers as he flies:
"See the maidens who've looked on me,
Sitting in sorrow with tears and sighs:
Better have let Love's eyes go free."
Still, he has ears: and where the gay
Songs and laughter of girls arise
(Music as sweet as flowers in May)
Straight to their hearts Love's arrow flies;
Then the music of laughter dies:
Farewell song and innocent glee.
"Not my fault," the archer cries,
"Better have let Love's eyes go free."
Not Love's fault: and who shall say,
Could we but leave him his pretty eyes,
Whom he would spare of the maidens gay,
Whom he would leave in the girlish guise?
Yet 'twere pity should beauty's sighs
Cause her flowers ungathered be:
With silken bandage cover his eyes,
Never let that boy's sight go free.

ENVOI.

Prince, the shaft of his arrow flies
Straight to the heart of her and thee,
Take no pity, although he cries,
"Better have let Love's eyes go free."

Mr. Besant has a theory, which Professor Palgrave supports, that no man can write good prose unless he makes it a practice at the same time to pen verses. The author of the pieces just given may be cited as an example in proof of this theory.

MR. BESANT AS DRAMATIST.

Regarding Mr. Besant as a dramatist very little can be said. This paragraph must, therefore, of necessity be a sort of "Snakes in Iceland" chapter. He dramatised with Rice their first story, "Ready Money Mortiboy," and the play was produced, but it was not successful. It was christened "My Son Dick," and the curious may care to hear that an acting edition of it exists in Lac's Library. The firm wrote an original play together—"Such of Good Man" was the title of it—but it does not seem to have succeeded upon the stage, inasmuch as the authors were afterwards fain to make a book of it. Yet Mr. Besant has always been supremely anxious to gain the plaudits of a theatrical audience. "To sit in a theatre, to see your own noble thoughts nobly rendered; to witness the faces of a large audience all moved by the same emotions; to say to yourself *ipse feci*—it is my handiwork; this is indeed solid and substantial reward. The time is coming again when the best genius of England will be drawn back to the stage, and the writing of dramas will be the chosen life's work of the future Thackeray." Once only has Mr. Besant been successful with a play, and that play cannot be said to be a very important work; it

was, in fact, nothing more than a translation—gracefully made it is true—of De Banville's "Gringoire." It was prepared a good many years ago for an amateur theatrical company that played at Lord Monkswell's house in Chelsea. The company in question included among others the Hon. John Collier and Mr. Walter Herries Pollock, as well as a few ladies. Mr. Besant called his translation "The Balladmonger." Years afterwards Mr. Beerbohm Tree heard of the existence of this work, and expressed a wish to see it. It was shown to him by Mr. Pollock, in whose possession it then was, and in a slightly altered form was accepted by the actor-manager for production at the Haymarket Theatre. It was played as after-piece during the run of "The Red Lamp," and was a great success. This is all that we have to relate concerning Mr. Besant's career as a dramatist.

V.—MAN OF ACTION.

People forget—or rather used to forget—that Mr. Walter Besant is something more than a writer; that he is also what Carlyle professed to prefer infinitely to a writer—a Man of Action. For twenty years the subject of this sketch acted as paid secretary to the Palestine Exploration Fund; then the demands made by his literary work growing more and more imperative, he became honorary secretary to that society for five years more. He founded the Incorporated Society of Authors, a task of very considerable magnitude, and until very recently acted as their chairman. He is secretary of the Arts and Crafts Association. He worked his hardest in connection with the building and the inaugurating of the People's Palace. Clearly, therefore, Mr. Besant is much more than what some people call "a mere literary man."

AT NO. I, ADAM STREET, ADELPHI.

This is not the place in which to discuss the work that has been done by the Palestine Exploration Fund, but there can be no question that Mr. Besant often had a pretty busy time of it at the offices in Adam Street. Many strange persons came to see him there. The most curious (he says) were the men with a crotchet. There was the man who thought that there never were any Jews at all; the man who believed in the Bible being one long allegory both as a whole and in parts; the man who could prove from the Bible conclusively that the earth was flat; the man who had discovered the canon of proportion from the Bible; the man who had a new translation of a text to offer, and so on. Most people can form some idea of this class of callers. Those who find it difficult to do so may, with advantage, read "All Sorts and Conditions of Men," and there study the character of Daniel Fagg. There was one scene enacted in Adam Street which Mr. Besant particularly recalls. This is his description of it:—

We are gathered in the large room of the Palestine Fund Offices. It is filled with antiquaries and scholars; there are members of our Committee; there is Major Conder; there is a detachment from the British Museum; there are Hebraists and antiquaries of all kinds. Among us stands, tall, grey bearded, a handsome man still, blue eyed, calm, self-possessed, the great Shapira, showing his treasure, the priceless copy of the Pentateuch with all the doubtful passages set right—written in beautiful Phœnician or Ancient Hebrew on skins brown with age. He values the document at—how much? Who is to value such a document? Who can set a price upon such a document? A million? Even a million would not represent its value. He is perfectly open, candid, truthful, and straightforward. His story is simplicity itself. The MS. was found in a cave in the Land of Moab. One would expect, perhaps, such discoveries in a cave. As for its authenticity he knows nothing. He asks for nothing more than an examina-

tion. Let Dr. Bond carry it away with him. So it is done. Dr. Bond receives the MS. and carries it away. Then Shapira goes too. Those who are left behind begin to scoff. Conder points out that he knows the caves in Moab where the thing was found, and that they are damp, and that damp is fatal to ink; with other damaging and incredulous suggestions. Then the truth comes out, and we hear that the forger, his great coup missed, has hanged himself, and will commit no more forgeries. One of his little, innocent, child-like fancies, however, remains in our office still. It is nothing less than the coffin of Samson—a plain roll of lead with the strong man's name scratched upon it in Hebrew characters.

AT NO. IV, PORTUGAL STREET.

Mr. Besant's work in connection with the Society of Authors has been, and is still for the matter of that, enormous in quantity—more, probably far more, than any that he had to do for the Palestine Exploration Fund. He made the Society; that is a fact admitted by all. Indeed, it was the feeling that a large number of newspaper-writers had grown to regard the Society as Mr. Besant, and as Mr. Besant alone, that induced him last December to resign the post of chairman which he had held for so long. His visit to Chicago as an English delegate to the Conference of Authors, which has just been held there, is within everybody's recollection.

VI.—WALTER BESANT: SOME CHARACTERISTICS.

It is just seven years ago that a young fellow fresh from the country—new, alarmingly new, to London and London life, new also to the profession (one, by the way, closely connected with literature), which he had somewhat rashly embraced, waited upon Mr. Walter Besant at the offices of the Palestine Exploration Fund in Adam Street, Adelphi. The young man in question was armed with a letter of introduction to his hero—a letter which had been given to him by a friend to whom he then owed, and always will owe, much. His trepidation as he crossed the threshold of the office is a thing to be vividly remembered—not one to be described. He told the gentleman who sat in the outer room, and who seemed to be poring over a huge map, the nature of his errand, and this gentleman—it was Mr. George Armstrong, no doubt—made a communication to the novelist who worked within. The two men exchanged a few words in a low tone of voice, and then—and then the young man was ushered into the inner room, the *sanctum sanctorum*—the room occupied by his long-time hero, the author of "All in a Garden Fair."

"DON'T BE IN A HURRY TO PUBLISH."

It was a pleasant-faced, kindly, middle-aged gentleman who looked up from his writing as the visitor entered the room. His table was littered with documents; many quarto sheets of blue paper covered with writing lay in front of him; there were proof-sheets about; books filled the shelves—books relating mainly to Palestine; the place conveyed the idea of work, and, above all things, of literary work. A more welcome greeting than that which this young man received from the novelist is not to be imagined. He had entered the room overwhelmed with awe; he left it feeling that he had found a friend, a man to whom he might turn in moments of doubt and of difficulty, a man who was frank and open-hearted, ready and willing to assist with advice and aid all who might be engaged in pursuing the devious and difficult path of literature. There was no show of ridicule or of resentment when this raw youth of twenty-one remarked that he desired to "do creative work," that he wished to follow in the footsteps of his hero, and that he intended to write works of fiction. Nothing of the sort. "Be on

of us"—that is what the kindly novelist seemed to say—"rest assured that you shall receive the heartiest of welcomes. Write books by all means, but *don't be in a hurry to publish.*" This young man from the country has learnt many things since that day, seven years ago, and has forgotten many; but there is one thing that he will never forget, and that is the unaffected kindness, the overbrimming geniality, and the transparent goodness of Mr. Walter Besant, with whom he then, for the first time, became personally acquainted.

URBANITY.

Urbanity—that, to put it in one word, is the first characteristic which comes into one's mind when one

more than once compared Mr. Besant, was probably the greatest worker of the century. But Besant, were the sum total of his labours ascertainable, would, we make no doubt, run him pretty hard—if, indeed, he did not beat the record. That Dickens could do so much was "mainly due to his orderly and methodical habits, to his clearness of mind, and to a capacity for business as wonderful as his genius for fiction." The words are Mr. Besant's. He does most of the things that Dickens did: the only thing that he refrains from doing, and that wisely, as most people will be ready to admit, is going out into society. "I am a working man: what little time I have left over when I have finished my day's work belongs by right to my wife and family, and not to

From a photograph by]

MR. WALTER BESANT IN HIS STUDY.

[Russell and Sons.

thinks of Walter Besant. He is always the same: calm, cultured, polished. A "travelled" gentleman, a man who has seen many countries and many peoples, a University man and a scholar, he never fails to impress those who meet him with a sense of his innate kindliness of heart and of his cultivated charm. Nobody who wanted help—and deserved it—ever approached the author of "All Sorts and Conditions of Men" in vain.

"TO SCORN DELIGHTS AND LIVE LABORIOUS DAYS."

He is one of the hardest-worked literary men we have among us. Charles Dickens, to whom we have

anybody else." That is what he generally says when questioned upon the point.

To get through so much work as Mr. Besant gets through with so little show of fatigue, and with no detriment to health, implies, as in the case of Dickens, Method. And, as we might expect, he is, of all men living, one of the most methodical. He is a born and trained mathematician; therefore he knows and feels that everything must be in its place, and that whatever is proper to be done must be done, and at the proper moment; otherwise the Result will be an incorrect one. (Any mathematician, by the

way, will tell you that Mr. Besant is one; it is clear from his handwriting, the peculiarities of which suggest one thing and one thing only—the use of symbols.) Thanks to method and order, he is enabled to get through what most folks would regard as an appalling amount of work; he is also enabled to find time for many generous acts—unostentatiously performed, but none the less real and unforgettable.

THE COLLECTION OF MATERIALS.

When Anthony Trollope was asked what sort of thing he would recommend to a young literary man, he replied that it would be “a piece of cobblers’ wax.” Walter Besant does not go quite so far as this; but all the same, he is a firm unbeliever in “fits of inspiration,” in “frenzies,” and the rest of the stock-in-trade of mediocrity. Literature means work; work has to be done; he who would succeed must be industrious. Therefore he is never idle; when he is seemingly the least engaged he is the most observant; he notes everything with a view to the future. There are in the drawers of his writing-table at Frognal End pyramids of brown paper packets, all carefully endorsed, and all filled with material for use in the years to come. Here may be found plots, incidents, characters, descriptions of scenes, proper names—everything, in a word, that the novelist wants. “A lot of rubbish,” says Mr. Besant, smiling, as he closes a drawer; “and I shall never use half of it.” But the fact that he has thought it worth while to collect and preserve all these things is characteristic of the man; and so also is his modest disclaimer of their value.

HIS REVERENCE FOR WOMAN.

Mr. Besant’s feeling towards Woman amounts almost to reverence. She is either a goddess—a superior being who must be placed upon a pedestal, and to whom Man must perpetually offer up incense and bring gifts—or she is the sweet sharer of his domestic joys, in which she has to sit at home by the fireside while Man goes out cheerfully to work and to fight, bringing home his gold and his golden guineas to throw them in her lap. He has been his views from his youth up: you may find them, expressed or implied, in any one of his books. Man is divine, and Woman must reign.*

THE DIGNITY OF THE LITERARY PROFESSION.

Mr. Besant takes a very high view of the Dignity of the profession of Letters. Wherefore he has urged, in season and out of season, the duty of the State to recognise

literary men as it recognises doctors, painters, lawyers, and the like. Not, of course, that Mr. George Meredith would be honoured by having a peerage conferred upon him. But the profession as a whole would be honoured, and would benefit greatly from the increased respect in which it would be held by all sorts and conditions of men. There is a story to the effect that about the time when the People’s Palace was opened by the Queen, Mr. Besant was offered a knighthood—the dignity conferred upon every little provincial mayor who chances to rule the corporation of a town in which the Queen stays. He refused the honour. But he was presented to Her Majesty. “Seest thou a man diligent in his business? He shall stand before kings.”

OUR DEBT TO MR. BESANT.

What do we owe to Mr. Besant? The Palestine Exploration Fund, to begin with, a society which has revolutionised the study of the Bible, is indebted to him for twenty-five years’ hard work, during which period its interests were looked after as no other man could have looked after them—is indeed indebted to him for much of its success. Dwellers in the East-End of London owe to Mr. Besant the People’s Palace, the precursor, one hopes, of many other similar institutions in the poorer parts of the Metropolis, and in the provinces. Industrial women are grateful to him for his powerful pleading of their cause—pleading which must in the end meet with its due reward. We who write owe it to Mr. Besant’s untiring energy and unflagging zeal that at length it is beginning to be generally recognised that there is such a thing as property in a book. We owe to him also the Society of Authors, still young, but destined, one is persuaded, to become one of the most powerful corporations in the land. Some of us, individually, owe much to his generous sympathy and friendly aid—never withheld, never asked for in vain—and more, perhaps, to the example which he has consistently set us, of diligence winning success. And the great English reading public—the public which he loves and which loves him, the public for whom he has laboured incessantly for a quarter of a century, *grande mortalitas ævi spatium*—they owe to Mr. Besant a number of delightful novels and other books, all works lofty in aim, pure in tone, and rich in interest. Whether these works will live or not, no man may say. But to feel that he has instructed, entertained, charmed, and improved his generation is to Mr. Besant a sufficient, as it is a present, reward. Long may he continue to wield his facile and graceful pen—our honest, English, manly Walter Besant!

JOHN UNDERHILL.

* Yes, no doubt, but vote?—No, not if Mr. Besant can help it!—Ed. R. or R.

LEADING ARTICLES IN THE REVIEWS.

WANTED, A PROPHET AMOS!

A SAD STORY FROM EAST ANGLIA.

MR. RICHARD HEATH, in the *Contemporary Review* for September, has an article on "Agricultural Depression in East Anglia," which is very sad and mournful reading. Mr. Heath has spent some time in East Anglia studying the social and agrarian condition of the country districts, and he sets forth certain facts which make the reader lament that the prophet Amos has been dead and buried more than two thousand years. The social condition is one which would have aroused the indignation of the Jewish prophets, for land is being added to land, and acre to acre.

A SAD CONTRAST.

The counties are being filled with the luxurious residences of men of great wealth, while the peasants are simply disappearing by thousands from the face of the earth. Mr. Heath says:—

The mansions of the East Anglian gentry, stables, gardens, conservatories, ever increasing in perfection; the family houses of the gentlemen farmers, the costly farm buildings—dairies with all the latest improvements, barns like great halls, bullock-sheds, cow-houses, piggeries, and dog kennels, all of the best—seem to testify that the prosperity of East Anglian agriculture is after all a solid fact. And this its statistics, taken broadly, to a considerable degree support. On the other hand, when examined in detail, and looked at with reference to certain classes, they reveal widespread and long-continued suffering. In fact, East Anglian statistics show that, concurrent with a gradual increase in the wealth of the East Anglian district, there has been a vast destruction of small farmers and labourers, the former beginning about twenty years ago, the latter many years earlier.

Ill fares the land, to hastening ills a prey,
Where wealth accumulates and men decay.

WEALTH UP—MEN DOWN.

The mischief in East Anglia has entirely to do with men, women, and children; it has nothing to do with stock, nor with rent. In the last ten years there has been an increase in cattle, in sheep, and in rental. The only kind of men, however, who have increased, have been bailiffs, farming large holdings. They have increased from 2,490 to 2,971. Side by side we have the striking facts that, in eighteen years, the annual rental of rural set incomes has increased by nearly £1,000,000 sterling, while 7,000 of the farm class, with all who depended upon them, have had to leave their homes and begin life afresh. While 7,000 have gone, more than four times that number of labourers have disappeared, and the wages of those that are left have fallen instead of increasing. In 1873, says Mr. Heath, the landlords' income has gone up £948,000, while the total labourers' income has gone down by £1,348,000.

THE EXODUS OF THE PEASANT.

In the last twenty years, Mr. Heath calculates that from 90,000 to 100,000 persons have been driven out from the East Anglia by the social changes of late years. The Rev. Barham Zincke says:—

The rich increased their riches and their numbers. But the labourers (the best men the world contains or has ever seen) could not better themselves; their numbers, too, had to be reduced. This means that a percentage of them must tramp somewhere or other, friendless and penniless. In many of our Suffolk villages some of us have seen their deserted cottages, which reminded us of the evicted Irish, and of the choked off Scotch Crofters, evicted and choked off through the action of the same Juggernaut system.

ITS EFFECT, ON THE CHURCH.

The result of this dispersion of the people is that those who remain are by no means well affected to existing institutions. Particularly, says Mr. Heath, they dislike the clergy:—

The National Church, which ought to hold up to the nation an ideal standard of morality, sanctions, and has for generations sanctioned by every means, a division of the fruit of the land which, taking into consideration their respective numbers, gives to the class who own the land more than nine times what it does to the class who labour on the land. And thus rather more than seventeen thousand landlords possess estates which, at twenty-six years' purchase, must be worth a hundred millions sterling; while a hundred thousand labourers are absolute lacklands, owning not a single inch of the soil on which they are born and in the cultivation of which they spend their whole lives. And to the support of this flagrantly inequitable system the Church of England gives and always has given, both by precept and example, religious sanction. Who can be surprised that East Anglian labourers have very little faith in the Church and its clergy?

Possibly the continued falling of the price of wheat may bring about a change which the moral influence of the Established Church has never been able to effect. One land agent is said to have 300 farms on his books to let without finding any one to take them. Mr. Heath thinks that if these farms were split up into small holdings they would let with ease; but this they object to; so many farms, larger than any one cares for for mere farming sake to embark their money in, lie idle. Mr. Heath says that the present state of things is transitional, and is not wholly to be regretted, as it gives time for a morality new to modern Christianity, but at least as old in England as John Wycliffe, to make its way in the country.

Sentimentalism and Punishment.

MR. G. R. STETSON, in the *Andover Review*, publishes an article upon the craze which possesses certain persons nowadays in favour of exempting criminals from almost any punishment. He holds that the social consequences of this delusion are very serious:—

The modern development of this so-called humanitarianism in the treatment of criminals has a triple origin: in ethical agnosticism, and in normal and abnormal altruism. The agnostic class, which is rapidly increasing and has become a power, augmented by the obtuse moralists who condone crime and pardon criminals from purely selfish and personal motives, very naturally advocates the minimum of punishment and the maximum of personal liberty irrespective of the rights of others, and in disregard of the claims of a well-organised society. The practical result of extreme humanitarianism is, that crime increases in the almost precise ratio of the increase of leniency in punishment. Against the growing evils of disorder and depravity, the results of moral obtuseness, obliquity, and ethical agnosticism, of the abuse of the pardoning power, and sentimental philanthropy, society has two main defences: forcible repression by law, and removal by an education which shall teach what is required by good morals and good citizenship in the Republic.

In *Macmillan's Magazine* for September there is an interesting paper upon "The Origin of the Redcoats in the British Army." The writer says:—

As the New Model Army created by the Ordinance of 15th February, 1644-45, is the true germ of our present army, so its dress is the true germ of our present uniform.

THE UNION OF ENGLAND AND AMERICA.

MR. GOLDWIN SMITH'S OBJECTIONS.

MR. ANDREW CARNEGIE'S earnest and eloquent plea in favour of the union of England and America has provoked Mr. Goldwin Smith to make a reply, which is published in the August number of the *North American Review*. Mr. Goldwin Smith, who is as enthusiastic a Disruptionist in Canada as he is a determined Unionist in Ireland, does not seem to see that the day on which Canada enters the American Union ought to be the marriage day of the Republic and the Empire. He is so bent upon connecting the Dominion with the Union that he closes his eyes willfully to the larger question which lies behind. He admits that American sentiment is growing more and more friendly to England, chiefly owing to the circulation of English literature in America:—

Anglo-phobia is slowly giving way in American literature to moral breadth and historical justice, though its traditional force is still great, and in the writings of politicians it is apt to be affected, whether it is felt or not, as a tribute to conventional sentiment.

THE MORAL UNION.

Mr. Goldwin Smith, who is very sarcastic concerning the union of hearts between the English and the Irish democracies, cannot entertain any hope of anything excepting a moral union between Great Britain and the United States:—

A moral reunion of the race, with a common pride in its common history and a consciousness of the part which collectively it has played and may yet play in the development of humanity, seems not very far from realisation. By the opening prospect and the warm sense of returning goodwill the idea of a still closer connection appears to have been generated in some minds. A vision of this kind floats through Mr. Carnegie's paper. But such a thing as a political or even a diplomatic unity of the English-speaking communities scattered over the globe is surely inconceivable. Supposing such a union possible, what definite object would it have? Where would its centre be? Who would direct its policy?

LIONS IN THE PATH.

Mr. Goldwin Smith would not have much difficulty in answering his own questions if he were as intent upon re-uniting the English race as he is upon severing Canada from the British Empire. The first definite object of the Union would be the establishment of a permanent judicial tribunal, which would be to all the English-speaking communities what the Supreme Court at Westminster is to all the States in the American Republic. The precise geographical centre where this Court would be established is a comparatively small detail in these days of electricity and of steam. The policy of the Union would be directed by the representatives of all its members, just as the policy of the United States of America is directed by the representatives of all the States in the Federal Union—and so we might go on. The importance of removing, as far as possible, all the impediments which stand in the way of the freest possible intercourse between the English-speaking race does not seem to have dawned upon Mr. Goldwin Smith, nor does he seem to see that almost every difficulty which he raises against the union of Britain and America might be urged against the union of California and Massachusetts.

HIS "NON POSSUMUS."

That this is so may be seen from the following sentence, in which he sums up the reasons why he declares that anything but a moral reunion is impossible:—

While there are important elements of unity in the race, there are also important elements of diversity arising from the local admixture in unequal proportions of alien blood, from

variety of circumstances attendant on dispersion over two hemispheres, and from the shades of character produced by living under institutions radically, perhaps, the same, yet modified in important ways. Mutual privilege in respect to naturalisation laws might not be impracticable; otherwise, to nothing beyond a moral reunion, it would seem, can we rationally aspire.

KING CHARLES'S HEAD ONCE MORE.

Mr. Goldwin Smith, having demonstrated to his own satisfaction that the conception of a re-united English-speaking race is irrational, at once proceeds to plead for the union of Canada with the United States, a theme which reappears in all his writings as regularly as King Charles's head in Mr. Dick's Memorial. He says:—

To a moral reunion of the English-speaking race, assuming, as we probably may, that the influence of the Irish vote is transitory, there is apparently but one serious impediment. That impediment is the intrusive presence of Great Britain as a political power in this continent, with the constant irritation and frequent disputes which her presence inevitably breeds.

Of the Canadians themselves few, probably, believe that things can remain for ever as they are. During a residence of more than twenty years in Canada I have seldom met with a Canadian who, if he had thought at all freely on these matters, did not in private avow or betray his conviction that a change must some day come.

THE ADVANTAGES OF REUNION.

Many of the advantages of uniting Canada and the United States are equally applicable to the wider reunion for which Mr. Carnegie pleads:—

The advantages of reunion to both parties are manifest and are hardly denied by those who, on what they think higher grounds, oppose the measure. It would exclude war from North America and dedicate the whole continent securely to peaceful industry and progress. It would remove all internal customs, lines, and impediments to trade. It would make the St. Lawrence, the fisheries, the sealing-grounds, and all the privileges which are now the subject of perpetual disputes, the undisputed heritage of all. It would open the whole field, including Manitoba and the Canadian Northwest, to the free flow of population. It would call forth the mineral wealth, now dormant, of the North, by admitting Canadian capital and enterprise to a region which they are now prevented from freely entering by mistrust of a foreign jurisdiction. The commercial benefits which it would confer on Canada by putting an end to the commercial atrophy necessarily attendant on her present state of isolation need not be rehearsed.

AN APPEAL TO WASHINGTON.

Mr. Goldwin Smith is not satisfied by any means with the way in which the American statesman received his overtures. He calls attention to the Canadian policy of the late administration, and asks plaintively:—

In face of such gyrations how can unionist combination and effort be carried on? The first thing needed if continental union is to be brought about will be something like a steady and consistent policy on the part of the Washington administration, combined with a bearing perfectly friendly towards Canada. President Harrison was little studious of sentimental effect, and he never showed Canada the friendly side of the shield. Is a steady and consistent policy possible for a democracy, the government of which is always changing hands? Can party, where it is the ruling power, be so far restrained within the bounds of patriotic duty as to refrain from factious manœuvring when vital objects of external policy are concerned? Have the American people in renouncing immoral aggrandizement also renounced national aspiration? Can local interests, when a great question presents itself, be kept in subordination to the interests of the whole country? These are queries which the treatment of the Canadian question by the American Government and Congress in the coming years will go far to answer, and the answer will not be devoid of instruction as to the probable future of government by the people.

ANOTHER VIEW OF MR. CARNEGIE'S SCHEME.

Writing on the "Reunion of the English-Speaking Nations," the *Leisure Hour* says:—

It is a grand idea, and worthy of the attention of statesmen and of philanthropists. Some of Mr. Carnegie's projects may be considered as merely sentimental and Utopian, but in the main the notion of Anglo-Saxon influence ruling the world will commend itself as the best hope for the future. The interests of trade and commerce, and the conflicts of capital and labour, may be hindrances, but these are not insuperable.

Apart from commercial and political influence, the goodwill of the better classes of the American people may be counted on. Take two incidents in proof of this. During the last war in China, when the English attack on the Taku forts brought our troops into peril, the American admiral joined in the fray, though supposed to remain neutral, uttering the memorable words, "Blood is thicker than water." On a more recent occasion, when Captain Kane succeeded in taking H.M.S. *Calliope* safe out of the hurricane at Samoa, a splendid feat of seamanship, when other vessels were stranded, as the English steamed past an American warship they were loudly cheered by the American crew, though at the moment they were themselves in imminent danger. The interchange of courtesies, in time of peace as well as of war, proves that the hearts of soldiers as well as sailors would soon beat in sympathy, and as descendants of the old stock in the days of Queen Elizabeth, and of Blake and Cromwell, when England was alone against the world, and was feared and courted by all nations.

One strange error defaces the proposals of Mr. Carnegie for reunion. He thinks it necessary to have uniformity of internal government among the Confederate nations, and advocates the abolition of monarchy as one of the conditions of reunion. He is utterly wrong in this, and it is the only criticism we at present make on his scheme. England is a monarchy only in name, and is a truer republic than the United States with its elected president. The cost of royalty is insignificant compared with that caused by a presidential election in the United States. Think also of the passions and tumults that would distract the State if a Republican president were created for Old England. If we are to have reunion, each part of the great confederacy must be free to work out its own internal constitution and government.

THE ULTIMATE DESTINY OF MANKIND.

THE UNITED STATES OF THE WORLD.

MR. G. C. SIBLEY, in the *American Journal of Politics* for August, maintains that the ultimate development of political society will be the formation of the United States of the World under a great government somewhat similar in character to that which now exists in the United States of America. The following is the picture of what would happen when such a federation of the world gets itself into being:—

Under the great constitution such men as Grover Cleveland, Gladstone, Bismarck, and Castelar would be nominated for supreme president, while presidents, emperors, and kings would be elected senators. Ambassadors and ministers would be no longer necessary, and those able men who now represent their countries in such capacities, together with princes and governors of states, would be representatives in the great congresses. The Supreme Court would be the highest court of judicature in the world, and would determine such matters as the "Eastern Question" and the "Behring Sea Controversy."

After the supreme government was fully organised, and in operation, then should begin the codification of the unwritten laws of nations. We would consolidate, systematise and adapt to the great government, the splendid labours of Grotius, Puffendorf, Bynkershoek, Burlamaqui, Vattel, Wheaton, Kent and Story, and in a condensed and comprehensive form have a code of laws which should operate throughout the world, enacted by the great congress of nations. One system of currency would be common to all countries, and weights and measures be uniform. Under that great constitution the

Nicaragua Canal and a bridge across Behring Strait would be constructed by private enterprises, having charters from the supreme government, and the stockholders would comprise capitalists from the Cape of Good Hope to St. Petersburg; from Cape Horn to Iceland, from New York and London to Peking, Calcutta and Constantinople. Railroads would be projected from the Atlantic seaboard to Paris, through Alaska and Siberia, crossing the bridge at Behring Strait.

HOW TO BE YOUNG THOUGH OLD.

THE EXPERIENCE OF SEPTUAGENARIANS.

A PARAGRAPH which I inserted in a recent number of the *REVIEW* calling attention to Signor Sebastian Fenzi's rhymed brochure on "The Secret of Health in Old Age" has elicited a response which has somewhat surprised me. I had some difficulty in obtaining the pamphlets from Italy, and some delay took place in supplying them to correspondents; but I can now forward them by return of post to any who care to send on seven stamps and their address.

Signor Sebastian Fenzi was rather hurt at my describing him as an old man. He is only seventy-one, it seems, and not seventy-five, and the idea he was old does not seem to have occurred to him. The fundamental principle of the regimen which he prescribes is that of an hour's vigorous gymnastic exercise, followed by a cold sponge bath every morning before breakfast. He says:—

Reaching life's middle course—(as Dante says)—
We feel that waning are youth's palmy days,
And that unless we stimulate vitality,
No chance have we to meet partiality
From Time, that grim and cruel here by degrees
All gnaweth and consumeth as it flies.

'Twas this that brought me to reflect, and I
Did there and then determine I would try
And single out what best can suit the thought
That Mother Nature to suggest had sought.

The course of brushing, athletic exercise, and washing which he advises is all set forth in verse. The result seems to be excellent. He is an athlete as strong at seventy-one as he was when forty, and as capable of as active exercise.

Another septuagenarian—a Major Menars—writes from Somersetshire:—

S. F. is a man well known in Italy, and his name is familiar to me through his occasional contributions to the *Medium*. Having been born on the 24th of October, 1822, he is not seventy-five years old. I have no wish to compete with him or any one else; I am only too glad to hear of any old man succeeding in keeping himself green. I was born in 1818, and shall be seventy-five at the end of next month, and in my younger days in India had anything but good health. Total abstinence since 1850. At first, in illness, I gave in occasionally, but in 1860 I read up and adopted Homœopathy, one of the many things the many (the Papists, leaners on authority) judge *a priori* instead of testing. Homœopathy enabled me to become an absolute abstainer; no stimulant, nervous (tea, smoking, etc.), or intoxicant of any kind. I am up at 5 A.M. all the year round, and before my ablutions exercise myself for about an hour with dumb-bells weighing 12 lb. each. Twice a week I am out on the tramp for five or six hours without stopping, and on other days from two to three hours. I have taken neither "fish, flesh, nor fowl" since 1875. I am a freelance—take no pledges and belong to no societies (vegetarian or otherwise). I take resolutions and keep to them as long as I see right. In "Italian Readings," by Aristide Provençal, Pisa and Livorno, 1884, is a biographical notice of S. F.

"THE LIKENESS OF THE PERFECT MAN."

A GLIMPSE OF WHAT HE WAS AND WHAT HE MAY BE.

THERE are few fallacies more widely spread than the complaisant assumption made by those who have never studied the subject, that we know all about the laws of the human mind. As a matter of fact, there is no department of Borderland that is so full of mystery as the relation that exists between mind and matter, and there are few fields of research which promise to yield such rich results as those which relate to what may be called the new psychology.

MR. F. W. H. MYERS.

§ Of English workers in this field Mr. F. W. H. Myers is *facile princeps*. He has for years been engaged in a *magnum opus* entitled "Subliminal Consciousness," every chapter of which opens out vistas of almost incalculable extent, and every page of it teems with suggestions calculated to shake even the most common-place mind from the moorings of that self-complaisant ignorance which imagines itself to be wisdom. The last issued number of "The Proceedings of the Psychical Research Society" contain two new chapters of this great study of the subliminal consciousness, to only one of which do I propose to call attention here. The seventh chapter, which is devoted to "Motor Automatism," I do not refer to, beyond stating that it contains the most extraordinary story of a murder committed two hundred and eight years ago, which was written automatically by a person who knew nothing at all about the fact that any such murder had ever been perpetrated, the source of the information professedly being a woman who was burnt alive for her share in the murder. The accuracy of the communication was subsequently verified. Of this and many other hardly less remarkable illustrations of information communicated by automatic handwriting I will say nothing, but turn to the paper on the "Mechanism of Hysteria."

A HELPFUL ANALOGY.

Without following Mr. Myers through his paper, I wish to call attention to the luminous suggestion with which it concludes. Mr. Myers points out that patients suffering from long established hysteria suffer from a gradual loss of consciousness which narrows the range of the perceptive faculties in a very extraordinary degree. Persons suffering from advanced chronic hysteria suffer from a loss of feeling more or less general. One side of one limb will become anæsthetic, and can be pinched or injured without its owner having any consciousness of the injury that is being inflicted upon his person; that is to say, whereas a person in normal health is conscious of any injury inflicted upon any part of his person, advanced hysterical patients find the range of their consciousness narrowed so that you can thrust a pin into parts of them without their feeling anything. A similar narrowing of their range of consciousness takes place in their eyesight; some patients lose the sight of one eye or both, others become colour-blind, others again become so extremely short-sighted that they can only see objects that are held close to their eyes; in like manner others who when doing their ordinary work are quite capable of exerting the normal strength of a healthy person, when they are asked to use their strength consciously, as for instance to squeeze a dynamometer, are as weak as babies.

REMINISCENCES OF A LARGER LIFE.

Such hysterical patients suffering from pseudo-paralysis, colour-blindness, short-sightedness, and utter inability to put forth their strength consciously when their attention has been called to it, are nevertheless capable under

the influence of a suggestion from a stronger will of feeling in limbs which had become anæsthetic, of seeing colours correctly, of seeing objects distinctly at a distance, and of exercising their ordinary normal strength. Even when they are not exercising those faculties under influence from without, they have occasionally flashes of recollection, gleams as it were of a larger life that they have lost, recollections of a state of existence in which their consciousness was normal; that is to say, when they felt where feeling had ceased to exist, saw when now hopelessly blind, and had power which they now are incapable of exercising. Such a patient affords Mr. Myers with an admirable illustration of what we are in our normal state.

OUR LOST OR LATENT SENSES.

We too have faculties—telepathic, clairvoyant, etc.—which can be occasionally evoked by suggestion in the hypnotic state; we too occasionally remember a state, as in dreams and elsewhere, in which we had a far wider range of consciousness than that which is limited by our five senses. But inasmuch as we have as a race sunk into a condition analogous to that of the hysteric patient, we agree to look upon these lost powers of ours with the same indifference or incredulity with which the unfortunate victims of this distressing malady regard everything that reminds them of the higher and the wider life which they once possessed. In a hysteric patient the disintegration of personality, the gradual narrowing of the field of consciousness can be observed by outsiders, but the patient himself is almost entirely indifferent to it. He is a wreck, a mere atrophied fragment of a human being, sometimes not possessing ten per cent. consciousness of a healthy normal human being. He does not distress himself about the lost 90 per cent. of faculty and consciousness, and therein also he is only too exact an analogy to the majority of human beings.

THEIR POSSIBLE RECOVERY.

To suggest to most men that there is latent within them, or that their personality ever possessed, a range of consciousness as infinitely transcending that which we at present possess, as the consciousness of an ordinary healthy man transcends that of a paralytic, blind, anæsthetic, hysterical patient, excites ridicule and contempt—rather than an aspiration after a recovery of the lost senses. Mr. Myers holds the inspiring faith that we at the present moment have the use of a mere fraction of what he calls our pre-terrene faculties, and he sees in the extraordinary potency of subliminal action fresh witness to the existence of its habitual residence within us, in readiness, if we can contrive to summon it, to subserve our highest needs. In the progress and development of our conscious life we have lost faculties that existed in our ancestors—lost them so completely that we do not even desire to recover them. Mr. Myers concludes his wonderfully suggestive paper by the following eloquent passage, in which, after describing the poor hysterical who will pass their days in re-reading the same newspaper, re-knitting the same pattern, with no apparent desire for progress or outlook beyond the present hour, he says:—

POOR HUMAN HYSTERICS.

Might not this tale be told, *mutato nomine*, of the whole race of mortal men? What assurance have we that from some point of higher vision we men are not as these shrunken and shadowed souls? Suppose that we had all been a community of hysterics; all of us together subject to these shifting losses of sensation, these inexplicable gaps of memory, these sudden defects and paralyses of movement and of will. Assuredly we

should soon have argued that our actual powers were all with which the human organism was or could be endowed. We should have thought it natural that nervous energy should only just suffice to keep attention fixed upon the action which at the moment we needed to perform. Nor, again, should we have been astonished at our capricious lack of power over our organisms, our intermittent defect of will. We should have held, and with some reason, that the mystery as to how our will could ever move any limb of our bodies was far greater than the mystery as to why certain limbs at certain moments failed to obey it.

DEFECTS ACCEPTED AS NORMAL.

And as for defects of recollection;—is the reader inclined to think that the hysterical *memory* could never have been accepted as normal? That some guess of a more continuous consciousness, of an identity unmoved and stable beneath the tossing of the psychic storm, must needs have been suggested by all those strange interruptions?—by the lapses into other phases of personality, by the competing fields of reminiscence, by the clean sweep and blank destruction of great slices and canties of the Past? I ask in turn how much of guess at an underlying continuity has been suggested, I do not say to the popular, but even to the scientific mind, by life broken as we know it now?—by our nightly lapses into a primitive phase of personality? by the competing fields of recollection which shift around the hypnotic trance?

A POSSIBLE RESURRECTION.

Nay, if we had been a populace of hysterics we should have acquiesced in our hysteria. We should have pushed aside as a fantastic enthusiast the fellow sufferer who strove to tell us that this was not all that we were meant to be. As we now stand—each one of us *totus, teres, atque rotundus* in his own esteem—we see at least how cowardly would have been that contentment, how vast the ignored possibilities, the forgotten hope. Yet who assures us that even here and now we have developed into the full height and scope of our being? A moment comes when the most beclouded of these hysterics has a glimpse of the truth. A moment comes when, after a profound slumber, she wakes into an *instant clair*;—a flash of full perception, which shows her as solid vivid realities all that she has in her bewilderment been apprehending phantasmally as a dream. Is there for us also any possibility of a like resurrection into reality and day? Is there for us any sleep so deep that waking from it after the likeness of perfect man we shall be satisfied; and shall see face to face; and shall know even as also we are known?

THE LOGIC OF THE MOLE.

ON "THE DELUSIONS KNOWN AS RELIGIONS."

MR. GRANT ALLEN writes very charmingly in the *Cornhill* on the mole, that four-footed engineer, concluding with the characteristic declaration that the more closely Nature is studied, the more clearly does it appear that her gospel can be compendiously summed up in the familiar phrase "Let the Devil take the hindmost." The same author writes in the *Fortnightly* on "Immortality and Resurrection." It is a very clever paper, full of facts and suggestions, but it reminds us at every turn of the subject of the essay in *Cornhill*. For here we have the mole turned sociologist and philosopher, with a pen in his hand moralising over the absurdity of people who will persist in talking of sun and moon and stars, which he, good mole that he is, has never seen; no, nor his father before him. There is no one so simply, so superbly arrogant as your mole, when it comes to be a question of astronomy and of the laws of light.

THE SOUL "A CURIOUS BLUNDER IN PSYCHOLOGY."

Here, for instance, is Mr. Grant Allen's engaging method of dismissing the soul of man as a curious blunder in psychology:—

Now how did this odd and baseless idea of a surviving ghost or spirit after death arise at all? Clearly, it is a result

of the crude and unscientific nature of early psychology. Unaware of the true relation of subject and object, and of the true theory of cerebral action, primitive men were of opinion that each of us possesses inside himself, in addition to the outer and visible man, another and smaller man, called the *soul* or *spirit*. I will not attempt here to decide at full by what reasoning this curious blunder in psychology first arose. . . . It must suffice to say that a number of facts, such as the existence of the breath, the phenomena of dreams, the peculiar conditions of fainting, sleep, epilepsy, and catalepsy, and other similar observations, suggested inevitably to the minds of early men the quaint notion that the human being was of a dual nature, consisting of two parts, one material and physical, the other immaterial and "spiritual," that is to say, partaking of the character of breath or wind. This latter or inner man is supposed to leave the body during sleep or the fainting condition, and to return to it again with waking or the revival of consciousness. It is also popularly conceived, even among educated and civilised people, to depart from the body at the moment of death, and to lead thenceforth a somewhat separate existence as a ghost or spirit. This primitive and long-lasting misconception, the parent of all the delusions known as religions, is due to ignorance of the physiological facts that the act of breathing is merely a function of the lungs, and the act of thinking merely a function of the brain and nervous system. Misapprehension of these points has led to the curious notion that the ghost, spirit, breath, or soul can exist apart from the body to which it belongs, and can even survive it.

Could any master-mole of them more complacently dispose of the sun in mid heaven? Mr. Allen is so full of compassionate scorn for the superstitions and "the false psychology which gave rise to the grotesque notion of a life after death," that he naturally feels impelled to empty the vials of his contempt upon that particular form of the "delusions known as religions," called Christianity.

CHRISTIANITY A RETROGRESSION TO BARBARISM.

It surged up from below, he tells us, from the dregs of the world, a religion of a lower type, which constituted a retrogressive movement from Hellenism towards barbarism.

Early Christianity was in all its essentials a special development of the common religious ideas of Asia Minor and Syria. It was the creed of Adonis, the creed of Attis, dressed up afresh and applied with minor differences to a certain historical or mythical personage, said to have lived in Galilee about the beginning of the Christian era. Of this personage himself we know really nothing but the name or names; every supposed fact or incident related of him is merely one of the common and universal incidents related of all the other gods. Christianity, in displacing the civilised religions of Greece and Rome, brought with it into Europe various ideas properly belonging to a lower and Asiatic stage of culture. It brought with it the ugly practice of burial, in place of the sane and wholesome practice of cremation. It brought with it the vulgar Jewish conception of Resurrection, in place of the elevated though erroneous Platonic idea of Immortality. It brought with it the hateful oriental notions of asceticism and repression, in place of the graceful and artistic Greek ideals of happiness, beauty and equal development. By means of these false notions it has retarded the progress of the world for at least half-a-dozen centuries; and it is still doing its best to retard the progress of the world in future. But the forces which tend towards civilisation are growing at last too strong for it, and reason and common-sense are beginning to overthrow the domination of the ascetic oriental creed of unwholesome restraint and unnatural repression.

What a curious belated echo is this of *Feenker's* "Infame," of which Voltaireans are now not a little ashamed! Whether it is a case of survival or of reversion, it is an interesting psychological curiosity. We can now imagine the kind of treatise that might be written by a mole on the laws of light.

WHAT THINK YE OF CHRIST?

MRS. BESANT'S REPLY.

In *Lucifer* for July 15th, in the first part of an article upon "Theosophy and Christianity," Mrs. Besant answers in her own words the question which many people have been asking concerning the position which she maintains at present in relation to the Christian faith. She says:—

DIVINE BECAUSE HUMAN.

Closely allied to the idea of a personal God is the view taken of Jesus, as the incarnate Son of God. "What do you believe about Christ?" is the next question which comes from the Christian's lips. "Do you deny the divinity of Christ?" The answer comes straight and clear; "We do not deny the divinity of Jesus; we affirm the divinity of every son of man."

Every world-religion has its divine incarnations, its "Word made flesh"; in all ages this incarnation has been styled the Christ, the anointed, and it is round this Ideal Man that the hearts of men have clung, instinctively feeling that he is the promise of the future, and that where he stands in the present all men shall stand in days to come. But if we want to understand the difference between the Christian view of Jesus the Christ and the Christs of Theosophy, we must take these views in connection with the view of humanity as a whole of which they are severally the result.

ALL MEN POTENTIAL CHRISTS.

The Theosophic view regards man as essentially divine, but the divine in him crusted over with a thick veil of matter; this divine essence in man is the Buddha, the Christ, and it is the "light that lighteth every man that cometh into the world." Through the veil of matter the light shines dimly, but in the lowest and the vilest some gleams of light are seen from time to time. Every man is a potential Christ, and the work of evolution is to render this potential Christ an active one; man's strength wells up from the divine within him; it is an essential property, not an external gift; the light is there—his work is to render his lower nature translucent, and to let it shine.

CHRIST INCARNATE IN ALL MEN.

That the Christ is "God in man" inclusively and not exclusively might well be argued—for those who take the *New Testament* as an authority—from the Fourth Gospel. Neoplatonism throughout, this view of the meaning of the Christ comes out very plainly in chap. x. 34–36. Jesus had been accused of blasphemy, in that he made himself God; his answer was a claim to rank as God *because* he was man, and divinity was inherent in humanity.

It was not in virtue of a unique position, but in virtue of a common humanity that Jesus is here made to claim to be divine; he identifies himself with man, instead of standing with a gulf between himself and his race. And so Paul, writing to his Galatian converts: "My little children, of whom I travail in birth again until Christ be formed in you."

Men have thought to exalt Christ by degrading man, whereas that which is the Christ—not limited to an individual but the Soul triumphant—is the very light and life of men. This is the Esoteric truth that has been hidden under the exoteric veil, and those on whom the beauty of this conception has dawned will no longer have any sense that they have lost their Christ when they see him incarnate in every son of man.

Mrs. Besant, in *Lucifer* for August 15th, continues the exposition of her views upon the difference between Christianity and Theosophy. These differences, it will be seen, are much more in phrase than in fact. Mrs. Besant says:—

A DISSENT FROM CHRISTIANITY.

As these conceptions of man's real nature become clear and definite, it is manifest that our whole method of dealing with men will change, and the popular ideas of virtue and vice, with heaven as the reward of virtue, and hell as the penalty of vice, will appear to us to be at once puerile and inefficient. And here we come into conflict with popular Christianity.

For if man's heart be naturally corrupt, if that which is deepest in him be evil and not righteous, if he turn naturally towards the bad and can only with difficulty be turned towards the good, then it seems reasonable to allure him to the distasteful good with promises of future happiness, and to scare him from the fascinating bad with threats of future pain. Whereas, if man's nature be essentially noble, and the Divine Ego which is his very self be only blinded with matter, and even in its darkness seeks for light, and in its bondage yearns for liberty, then all this coaxing with heaven and threatening with hell becomes an irrelevant impertinence, for man's innermost longing is then for purity and not for heavenly pleasure, his innermost shrinking is from foulness and not from hellish pain.

MORE IN PHRASE THAN IN FACT.

But let us grant that something more than the presentation of a great Ideal is necessary to stimulate the progress of the less-developed souls. Then let us teach them, and prove to them, that pain follows the evil-doer as his shadow, or as the cart-wheel follows the ox. Let us make them understand that they are in a universe of law in things moral as in things physical, and that suffering and degradation are the fruits that are ripened from the blossoms of sin. Not misery in a far-off hell, which they can escape at the last moment by a prayer, but misery here on earth where the wrong was done, and where must be restored the equilibrium they have disturbed. Let us teach them Reincarnation, that brings the Soul back to the scene of its transgressions, and Karma, the Great Law, that sets each man reaping the harvest he has sown. Thus may be chipped away the crust of ignorance that hinders the shining forth of the Light within them, and thus their responsiveness to the Ideal will increase.

THE CHRIST WITHIN.

As the incarnation of the Ego in animal man is the Esoteric truth underlying all legends of divine incarnations, so the work of that Ego with its human tabernacle is the Esoteric truth underlying the doctrines of atonement, imputed righteousness and divine grace. The Ego, uniting with itself the lower nature, gradually purifies it, makes it at one with itself, and constantly pours its own strength into the human personality, inspiring it, guiding it, lifting it, glorifying it. The Christ is builded from within by this slow process through countless incarnations, every step being made by the joint efforts of the higher and lower natures, which from being twain are gradually welded into one. Thus is taught a magnificent self-reliance, thus is built up by ever-renewed effort a strong and perfect man. Here, perhaps, is the strongest point of contrast between the Esoteric Philosophy and popular Christianity, and as this touches conduct and the spirit of our life, it is of the highest importance. Is man to rely on a force external to himself, or is he to seek strength in himself? On his answer to that question depends his future.

If this is the strongest point of contrast between Theosophy and Christianity, then the difference is small indeed, because, although Christianity teaches man to rely on a force external to himself, while Theosophy teaches him to seek strength in himself, the difference is practically immaterial the moment you begin to define what you mean by self. What the ordinary man means by self is his conscious self, but that conscious self is very different indeed from the Divine Ego from which, the Theosophist teaches, man must draw the supply of light necessary for him to attain his true development. The doctrine of the Divine Ego which the Theosophists teach can with very little exercise of subtle reasoning be proved to be identical with that kingdom of Heaven which, is within you, upon which the Gospels and the Quakers constantly insist. The light and strength of the Divine Ego lie as much outside the ordinary conscious self as the kingdom of Heaven which is within us lies outside the ordinary carnal nature of unregenerate man.

THE CONQUEST OF PASSION.

MR. RUSKIN'S ADVICE TO YOUNG MEN.

MR. GEORGE STRONACH, in the *English Illustrated Magazine* for August, publishes some letters which Ruskin addressed to a young student of his, full of kindly feeling, sound common-sense, and, what is more generally needed, earnest Christian counsel.

HARD WORK AND HARD PLAY.

The following passages on the resisting of temptation may be read with advantage by everyone. The first extract is from a letter written in August, 1854:—

You say you must work hard to keep you from evil. Will not hard play do as well? I don't think God has put any passions in the human frame which may not be subdued in a healthy manner, as long as it is necessary to subdue them—I wish you would ask a clergyman about this.

I would accept your promise with gratitude, if I thought that it would be safe for you to make it. But I believe there is no means of preserving rectitude of conduct and nobleness of aim but the grace of God, obtained daily, almost hourly—waiting upon Him and continual Faith in His immediate Presence. Get into this habit of thought, and you need make no promises. Come short of this, and you will break them, and be more discouraged than if you had made none. The great lesson we have to learn in this world is to *give it all up*: it is not so much resolution as renunciation—not so much courage as resignation that we need. He that has once yielded thoroughly to God will yield to nothing but God.

INSTANT FLIGHT FROM TEMPTATION.

In November, Mr. Ruskin wrote again to the same correspondent on the same subject, as follows:—

After a very fatiguing day, I can only—for it is near midnight—write you this line to say I accept your promise, and am about to pray for you that you may be enabled to keep it. Only remember that no human strength can keep it except by instant flight from all temptation—*instantly* turning the thoughts in another direction. No reasoning or resolution will stand. To turn away the eyes and thoughts is the only way.

If you have not been hitherto enabled to do this, you will find that in perfect chastity, of thought and body, there is indeed a strange power, rendering every act of the soul more healthy and spiritual, and giving a strength which otherwise is altogether unattainable. Spenser has set it forth perfectly under the image of the all-conquering Britomart. When I say “no human strength can keep it, except,” etc., I mean that not even by flight—human strength can conquer without perpetual help. But God has appointed that His help shall be given only to those who “turn their eyes from beholding vanity”; nay, it is by this help that those eyes are turned. I can only say a *word* on the question of your letter to which this leads.

USE THE BIBLE.

I never met with but one book in my life that was clear on the subject of works and faith, and that book is the Bible. Read it only on this subject. And I think you will come to the conclusion that though works are not the *price* of salvation, they are assuredly the *way* to it, and the only way. I do not mean the Way in the sense in which Christ is the Way, but the way in the sense of the Strait Gate. For Christ the Door is not strait, and Christ the Way not narrow. But the short of it is—Christ says—“When ye have *done* all that is commanded you, then say we are unprofitable servants.” He does not say—Do *nothing* that is commanded you, and all is right if you say you are unprofitable.

WORK, WORK, WORK!

Read the Sermon on the Mount. It is work, work, work, from beginning to end. And I believe all the divisions of Christians are caused by their hatred of the simple text—“Whoso heareth my words and *doeth* them.” The Romanists substitute paying and praying for doing—the Scotch, believing for doing—the English, reverence for doing—and so on. Plain

taking up of the hard, heavy cross is the last thing with them all. Strive always to *do*—acknowledge continually that it is Christ which worketh in you, both to will and do. And you will soon know the doctrine whether it be of God.

FRIENDSHIPS BETWEEN MEN AND WOMEN.

SIR HERBERT MAXWELL, in the *Nineteenth Century*, has an article entitled “The Conduct of Friendship,” in which he discusses among other things the question of friendships between men and women. He thinks that the difference of sex itself is well nigh an insuperable hindrance to attachments between persons of the same age; this is accentuated in youth by the difference of education, and in maturity by the limitation of aim and scope. He points out that the exclusion of women from public life, from politics, and from commerce shears away a great province of employment in which woman's interest can never be other than altruistic. The education also makes a difference, and Sir Herbert says that a man is conscious of a voice, inanimate, which finds no sympathetic echo in the woman, for from her the Greek poets have been sedulously sealed away. The whole scheme of a boy's education is laid apart from the girl's, what wonder then if there is a lack of harmony, without which friendship is not? Another difficulty is that which begins in friendship often ends in love. It is interesting to notice that Sir Herbert Maxwell admits that one great difficulty in the way of friendship between men and women would be got over if women took part in business, politics, and commerce:—

But there is another respect in which the training of young people of the wealthier class not only builds up a barrier between their lives, but sends the whole current of their thoughts into separate channels. From the day a boy goes to school he is aware of the existence of a certain kind of evil of which a girl never suspects the existence until she has grown up. The boy knows it is evil, but he learns also that in the eyes of the world there is no disgrace incurred if it is yielded to; that, on the contrary, public opinion condones it. It is the subject of constant conversation among the young, and often of arch allusion among older men, and thus, unless he is of peculiar constitution, it occupies a great deal of his thoughts. The finger cannot be laid on any circumstance of modern society which so completely severs the outset in life and separates the tone of mind of the two sexes. And it endures through life; for though a woman's purity is acknowledged to be beautiful and worthy of worship, it is held to be inevitable—looked for as matter of course, like the purity of a crystal. We prize it, but we do not wonder at it, for it is secured by sedulous training and the habit of watchfulness; it implies no mortal encounter with evil. But a man's purity does stir our marvel, for it means a living martyrdom.

Surely this is the language of extreme exaggeration. Men and women are a great deal more like each other than is conventionally supposed to be the case, and this is specially true of the subject on which Sir Herbert Maxwell is writing. I only marvel that any writer as cultivated and as experienced as Sir Herbert Maxwell could possibly speak about the virtue of a woman as implying no mortal encounter with evil. That kind of cloistered virtue is at least as rare as the living martyrdom about which he speaks so eloquently. Besides which, if what he says is true, surely there is all the more reason for lessening the pangs of that living martyrdom by extending to men the benefit of the sedulous training and habit of watchfulness which has worked such wonders for women. Sir Herbert Maxwell's remark, however, is suggestive, inasmuch as it indicates what is undoubtedly one of the greatest obstacles in the way of that friendship between men and women, which is the great desideratum of social intercourse.

OUR PUBLIC SCHOOLS.

BY THE HEADMASTER OF HARROW.

In the *New Review* for September, the Rev. J. E. C. Welldon replies to the article on "Our Public Schools, their Methods and their Morals," which appeared in the *New Review* for July. Mr. Welldon complains that the critic deals out with indiscriminate censure. He admits that our public schools are not immaculate. There are some which lack intellectual life and energy, but with all their faults they excite above all other institutions a touching and abiding affection in the hearts of the great majority of the boys who have passed under their influence. After specifying the various points from which he dissents from the writer of the article to which he replies, Mr. Welldon says that he agrees with him in thinking that in the competition for Entrance Scholarships, the sons of poor parents should stand upon the same level, at least, with the sons of the rich. He suggests that the question might be solved by giving the rich boys the status and character of scholars in their public schools, while reserving the emoluments of scholarships for the poorer. Mr. Welldon laments that in the ancient schools tradition is so fatally strong. He tells the story of the headmaster who, being asked what is the greatest difficulty which he had to contend with in administrative reform replied, "The Conservatism of my Radical teachers."

Public schools, says Mr. Welldon, are much more humane places than they used to be. Fights are dying out, and the young are guarded to-day in a greater degree than ever before from the savagery which has been the scourge and disgrace of public schools. The birch has lost its historic dignity. Replying to the sneer at the educational deficiency of the schools, Mr. Welldon says:—"It may safely be inferred from the results of examinations at the Universities, or for the Army and the professions, that the ignorance of public school life is exaggerated."

On the painful question of impurity which prevails at some schools, Mr. Welldon says:—

It is not true, according to my experience, that "some of our public schools almost provoke the punishment of the Cities of the Plain." It is not true that horrible iniquities "are a matter of jest among the boys at the schools themselves." I do not deny the need of unremitting vigilance in regard to the moral welfare of a school. Purity is a subject which should be seldom on a schoolmaster's lips, but never out of his mind. Where several hundred human beings of immature years are taken out of their own homes and away from the influence of their mothers and sisters and set down for many months of the year in a society which has many noble characteristics but some inevitable drawbacks, it is pretty certain that certain evils will occur. But I doubt whether an equal number of men in any circumstances commit less evil than the boys in a public school. One is apt to forget how few are the boys who do grave wrong, what an infinitesimal portion of the school they are. The writer advances serious charges; they may be just, but they are not supported by evidence. It happens that I can appeal to statistics. It may be assumed that the amount of evil detected among boys will bear a certain relation to the amount of evil they commit; and taking the school which I know best, in the years when I have known it, I find that the number of boys who have got into serious trouble and disgrace of any kind during their school lives does not amount to two per cent. But how strange it is that a writer should fancy he can solve in two or three sentences the moral problem which lies so deep in human nature! Has he attempted it? I cannot help asking, and does he know what anxious care is brought to bear upon it by schoolmasters? He cannot think they are indifferent to it.

THE INDEX EXPURGATORIUS.

HOW IT IS WORKED IN ROME.

FATHER CLARKE, in the *Nineteenth Century* for September, describes in detail the mode in which the Vatican deals with books before them on the Index Expurgatorius. As Father Clarke says:—

The story is one full of interest to non-Catholics as well as to Catholics, not only on account of the importance of the question, but because it presents a very suitable opportunity for explaining the *modus operandi* of tribunals of faith, and the character and authority of the sentences they pass on propositions laid before them for decision.

Books can be condemned either by the Congregation of the Inquisition, or by the Congregation of the Index, or by both. Professor St. George Mivart's papers on "Happiness in Hell" were condemned by both. The following is Father Clarke's account of the Congregation Index, and the way in which it does its work:—

The members of the Congregation of the Index are some six or seven cardinals appointed by the Pope. It has a prefect, or president, an assistant, and a secretary, the last named being always a Dominican. It has attached to it a number of consultors, selected from the ranks of the secular and regular clergy of Rome. Its method of procedure is naturally a replica, more or less, of that of the Congregation of the Inquisition, and its sentences are, in a majority of instances, supplementary to sentences already passed in the older Congregation. A large proportion of the books condemned by it have previously been condemned by the Inquisition. Sometimes, however, it takes the initiative, and it then proceeds as follows: A book is denounced by some zealous Catholic to the Cardinal Prefect as hurtful to souls, and the denunciation is laid before the secretary of the congregation. The denouncer, or delator as he is technically termed, has to give full reasons for his complaint. The secretary has then to examine the book for himself with care, and to associate with himself two advisers, chosen by him with the consent of the Holy Father or the Cardinal Prefect. If their collective judgment is against the book, a further adviser has to be selected who is an expert in the special subject of which the book treats. He has to give in a detailed report to the secretary, marking the particular passages to which exception can be justly taken. After this a preliminary meeting of the body of consultors is held, the secretary being present with at least six consultors who are familiar with the topics discussed in the book. Finally a general meeting of the cardinals composing the congregation is held, whose procedure is exactly the same as that of the Congregation of the Inquisition. There is the same full discussion, the same reference to the consultors, and finally the same report of the proceedings and of their result to the Pope, with a view to his approval of the sentence passed.

In the decree recently passed respecting the articles of Professor Mivart there is a condemnation by both tribunals. The decree of the Inquisition condemning them is mentioned in the decree of the Index, and yet the Index, instead of merely placing them in consequence on the list of prohibited books, has added a separate condemnation of its own. The decree condemns and proscribes St. George Mivart's "Happiness in Hell," and says:—

"Wherefore let no one henceforward, of whatever rank or condition, venture to publish in any place or language, or to read if published, or to keep in his possession, the aforesaid works thus condemned and proscribed, but let him be bound to hand them over to the Ordinaries of the place, or to the inquisitors of heresy, under the penalties laid down in the index of forbidden books."

This decree is decisive respecting the general tendency of the articles in question. It proscribes the doctrine that they teach as in opposition to Catholic dogma. The controversy is now happily at an end. *Roma locuta est: causa finita est.*

MR. JOHN MORLEY.

A FANCY PORTRAIT BY ADMIRAL MAXSE.

ADMIRAL MAXSE, stirred to wrath by Mr. T. P. O'Connor's application of the word Judas to his friend, Joseph Chamberlain, pours forth his wrath in the pages of the *National Review*. His article entitled "Judas" is a vindication of Mr. Chamberlain and the Unionists, but the most interesting part of this vigorous expression of opinion is that in which the Admiral devotes his energies to the dissection on the political career of Mr. John Morley. I quote the following passages, which represent what may be described as the other side of the shield to that which I portrayed in my Character Sketch of the Chief Secretary.

AN EMINENT RADICAL, FORSOOTH?

Could Mr. John Morley be described as an eminent Radical? He was never known as a politician at all until Mr. Chamberlain took him up. He was essentially a literary recluse: with, however, an inordinate ambition. His opinions were his religion. The man who differed from them was a bad man with whom there could be no terms: Mr. Morley became inflated with a righteous wrath, and in private life excommunicated friend after friend. He sat at the feet of Auguste Comte (all experience came to him through the literary medium), and imbibed from him his views on human government—not on religion. Under his teaching great nations became an abomination. Comte's cardinal doctrine is that they are to be subdivided into small ones, or (to quote Mr. Frederic Harrison) "into real national units, of which Scotland, Ireland, Bohemia, and Bavaria would be among the largest—sufficiently manageable to govern themselves peacefully." Of all the fantastic notions espoused by the philosopher and preached by the fanatic, this one—that the more men are partitioned off from each other by arbitrary frontiers and divided by customs and principles and varied interpretations of morality, the better,—is the most grotesquely absurd. It is essentially the fiction of the bookworm; of the man who has never been out in the world and known men. How is it that this doctrine of Dissolution finds favour in England? Alas! because our only protection from the philosopher-craze consists in an appeal to a class so ignorant that the very term "dismemberment" is a mystification.

A RIGHT HON. AFFRONT TO THE NATION.

Mr. John Morley might quite consistently have figured as a Swiss, or a Swedish, or a Belgian Minister; but that he should occupy the position of a British Cabinet Minister is a gross affront to the nation. He is thus in power within the citadel of the Empire whose dissolution he desires. As a journalist he never ceased to deery our influence abroad; he invariably urged a policy of poltroonery and the abdication of all responsibility outside our island limits; he helped to sacrifice Gordon in Egypt; and, more than any man, he insisted upon our cowardly abandonment of the Soudan. Indeed he was not content with the course of scuttling already undertaken, he pressed at a public meeting for the "withdrawal of our troops at the earliest possible moment." He was probably the single Englishman who was content with Majuba Hill; needless to say that he urged abject surrender. A very curious characteristic in Mr. Morley is that he regards the exercise of physical force with a superstitious horror; but it is chiefly odious to him when it is exercised on behalf of any constituted authority. He can "sombrely acquiesce" in the moonlight outrage of Ireland, and palliate such exercise of physical force as was displayed in the September massacres of the French Revolution. Any insurrection against authority commands his sympathy; and, although he objects to having his own house broken into, and is a rigid economist in regard to the rights of property, the sight of a criminal pursued by a constable renders him indignant with the latter.

THE FATHER OF A NIGHTMARE.

Whenever—if ever—the secret history of these times is written, it will, I think, be found that Mr. John Morley has had more to do with the scheme of setting up an Irish Parliament than any other person in the United Kingdom. Mr.

Gladstone's is essentially a mind liable to impregnation, and then it is alarmingly prolific. I always predicted that whenever Mr. Morley had the chance he would obtain a great ascendancy over Mr. Gladstone. His intellectual interest and literary information, his vehement disapprobation of ordinary English ideas, his loathing of responsibility abroad, his tempestuous fits of moral indignation (to say nothing of his personal charm of manner and delightful talk)—all these qualifications made him an attractive and soon an indispensable adviser to the septuagenarian, who must have perished politically of barrenness but for the sustenance of another person's ideas and convictions. I believe that England's present nightmare is due to these two men having met.

A FENIAN M.P.

Mr. Morley has been the prime instigator of the disastrous measure which threatens the disruption of the United Kingdom and civil war in Ireland. To him it is chiefly due that we have entered a period of national agony and suspense which will outlast the present generation. No terms can be sufficiently severe to expose and denounce his conduct. If he were properly appreciated, he would not be able—howsoever estimable he may be in private life—to show himself upon a public platform in England, or in Scotland, or in loyal Ireland. He could only fitly represent a Fenian constituency.

Jew-Baiting in Ireland.

In the *Lyceum* for August 15th, the Editor returns to the consideration of the reason which seems to justify caution in encouraging the settlement of the Jews in the country. He says:—

But we do not indulge the hope that our protest on the head, or indeed any other protest whatever, will prevent the evil of which we gave warning. If Ireland is found a suitable field for the operations of the Jewish money-lender—and with the transfer of the ownership of land to the peasantry it will become a suitable field—the Jew will remain, and will multiply amongst us. It is of importance to make acquaintance with one who is thus likely to be a persistent neighbour. To afford our readers an opportunity of making this acquaintance, I propose giving some account of the Jew as he appears among the civilised nations of the "Aryan" races. As we proceed we may be able to suggest some explanation of the hatred which has pursued, and still pursues, the Jew among so many civilised communities. Should we be able to do this, our remarks may help to indicate some means of forestalling and obviating this rancour amongst ourselves.

Should Hypnotism be Monopolised by M.D.'s?

DR. JUDSON DALAND, in *Lippincott's Monthly Magazine* for September, protests against the unlicensed practice of hypnotism. He lays great stress upon the evils which might arise from hypnotism when in the hands of vicious and criminal men. He says:—

I protest most earnestly against the practice of hypnotism by any but physicians. Public exhibitions do incalculable harm. Professional magnetisers still claim their share of victims, and the use of this tremendous power should not be looked upon as a parlour amusement, incapable of doing injury in France, Russia, Austria, Italy, Belgium, Holland, and Switzerland have already recognised the danger, and have passed restrictive laws.

Multiple Voting in Belgium.

MUCH is expected, says the *Christian at Work*, of the proposed new suffrage law of Belgium. It is to be based upon four qualifications—intelligence, age, matrimony, and property. Graduates of colleges and universities may vote twice at each election. A married man who has reached the age of thirty-five may also vote twice. A married man who possesses a certain specified amount of property may vote three times. At the present time there are only about 120,000 legal voters in Belgium. Under the proposed plan there will be 1,200,000 voters with a voting power of 1,800,000 votes one day.

ENGLAND AND THE SOUDAN.

AN APPEAL FROM FATHER OHRWALDER.

ONE of the most interesting articles in the magazines for September is that entitled "A Talk with Father Ohrwalder," which appears in *Blackwood*. The writer gives a very interesting account of the eminent Father whom he interviews at length, but, curiously enough, without recognising that he was doing his work just like any other good interviewer, neither better nor worse. Some vague suspicion of this crossed his mind, and he recoiled from the idea, but he went on with his work. All this is very silly. A good interviewer is simply a gentleman who holds a conversation with another, the only difference being that in the case of the interviewer, the general public are admitted to share in the communications which he is able to obtain from his subject.

The *Blackwood* interviewer gives a very vivid picture of Father Ohrwalder, and reproduces carefully what he says, noting the while the fiery flash of his eyes, and the passionate tone of his voice. When asked what was the condition of helping the Soudan, Father Ohrwalder exclaims:—

"England, my friends, I tell you England is the only possible condition! Ah, if you in England did but know the power of your name in the heart of the Soulan! I speak of what I know, and I bid you believe me, there is but one chance for those poor millions of slave-bound, crushed, and helpless beings,—one and one only, the protection of England. Until England, as a nation, awakes to the consciousness of the power of her name and the gravity of her responsibility in the Soudan, there is nothing on earth that can bring a ray of hope to that poor country."

"But," we suggested, "surely the destruction of Hicks Pasha's army, the fall of Khartoum, the murder of Gordon, and the failure of the Nile expedition for his relief, must have irretrievably shattered the prestige of England in the Soudan?"

"Not in the least," he emphatically replied.

Father Ohrwalder proceeded to explain that, notwithstanding the injury that had been done to our prestige by our disasters, they had been fully retrieved, and at this moment the Khalifa was filled with an overpowering sense of the power in England.

The interviewer remarked that there was very little chance of England intervening in the Soudan at present; whereupon—but I had better quote textually what he says:—

"Ah, well!" observed Father Ohrwalder; "It may be as you say. But unless I am greatly mistaken, it will not be very long before the force of circumstances will compel your country to conquer the Soudan; unless, indeed, you are prepared to sacrifice all that you have done in and for Egypt, and intend to retire from your present position."

"And supposing England did so?" we inquired.

The Father shrugged his shoulders as he smilingly replied—

"Oh, then, of course, her influence is for ever destroyed in Egypt and the Soudan, and she will never again be able to interfere. But," he added, with a sudden burst of vehemence, "it is not possible—England never can prove so false to herself. It would be a crime—a crime in the sight of God and of this African humanity—of which England could never be guilty."

"You speak strongly," we said, "and yet you are not an Englishman yourself. Are there no other nations who could achieve in the Soudan what you expect from England? What about France, Germany, Italy, or even Austria, your own country?"

"None," was the emphatic reply. "If you had lived in those distant regions of the Soudan so long as I have, if you had

mingled in the daily life of the natives, listened to their conversation, and become acquainted with their ideas, you would know that the name of England is with them an almost magical spell, and that England is synonymous in their minds, with freedom, prosperity, and civilisation. They scarcely even know the name of any other European country—I am speaking, of course, of the ordinary Soudanese peasants; and if any nation has a call from heaven itself to release these wretched people from slavery and oppression, to restore the distracted country to peace and security, and to lay the foundations of its future greatness and prosperity, that nation is England. Ah! would that I had the opportunity and power of stirring up your great country to a sense of its might and of its responsibility! Would that I could make every Englishman feel that he has a solemn mission from God in this matter! Would that I were able to impress upon his conscience the misery which the Mahdi and the Khalifa have spread throughout the Soudan! The accursed slave traffic was never so rampant in Africa as it is at this present moment. The slave-market at Omdurman is one of the largest and most frequented of any that have ever been known. It is so uncommon thing to see a thousand women and girls exposed for sale, in one day.

GENERAL HAMLEY AND HIS CATS.

THE writer of a very appreciative character sketch of General Hamley in *Blackwood's Magazine* contains a passage of more than general interest. Many people knew General Hamley, no doubt, but the number that knew him were but as a drop in a bucket compared with the number of those who know cats, and who will be more attracted to the departed soldier on account of his affection for these household pets than for the part which he took in storming the earthworks at Tel-el-Kebir. The writer says:—

No account of General Hamley would do him justice which did not allude to his affection for cats. The cat in effigy, or in water-colours or crayons, was as common on the tables and walls in his rooms as the bears about Berne. Cats in all characters and situations were showered on him in Christmas cards by ladies who flattered that amiable weakness. He was hand-in-glove with all the cats of the clubs, whether, as he said, they were regular or merely honorary members. He lived on terms of daily familiarity with the cat who used to reside in a hutch behind the "United Service." As he walked home in the peaceful night by lamplight he could never pass a cat on a door-step without stooping to scratch it. In his most earnest talk at one of the windows in the Athenæum dining-room, he would stop himself and lay his hand on your arm, if he saw one of his feline friends stretching itself and polishing its claws tiger-like against the trunk of a tree. We remember at one of the annual *Saturday Review* dinners at Greenwich, by an odd coincidence, four men chanced to be seated together, all devoted to cats. Two of them had written monographs on the noble animal, but Hamley was the most enthusiastic of the four. We have seldom heard him in greater *verve* or force as he illustrated his psychological analysis of the qualities and virtues of his favourites with a flow of anecdotes and recollections. One of these he gave in the letter in "The Story of the Campaign." On the march from the Alma to the Katcha, "I carried a small black kitten, which one of our people picked up on the bank of the river, on my holsters for some time, feeding him with biscuits, but during my absence from the saddle he made off." What a pleasing trait that is in his character!

In the *Modern Review*, Gail Hamilton discourses once more upon the Maybrick case, and Mrs. Wolstenholme Elmy delivers her soul vigorously concerning the heresies of Milton when the poet ventured to deal with the sacred women.

THE HEREFORD ELECTION.

HAS IT ANY POLITICAL SIGNIFICANCE?

A CORRESPONDENT in Hereford, in a position to form a good judgment on the subject, writes as follows:—

"There were few reasons why Hereford should have been exalted into a sort of national polling-booth, but no sooner did Mr. Grenfell resign than Hereford competed with Westminster the claim to be considered the hub of English political life. For ten or twelve days scarcely a train arrived which did not bring speakers or canvassers or other political officials ready and anxious to make history. Mr. Ratcliffe Cooke, in his election address, was naturally very complimentary to the retiring member, with whom he expressed general agreement, both as regards bimetallism and the Irish question. But practically both sides quietly ignored the currency problem. As an election cry it was felt to be decidedly cumbersome. It required a good deal of explanation, and explanations on election platforms are always to be avoided. What was wanted in Hereford by Mr. Cooke's friends was the short snappy sentence in Mr. Grenfell's letter: 'I cannot,' wrote that gentleman, 'support a policy of Home Rule which recognises the presence of Irish Members at Westminster to vote on purely English matters, whilst giving them at the same time the exclusive control of their own affairs.' This was the battle-cry raised on behalf of Mr. Cooke by men great and small. The cry caught on, and although the Liberal orators made a very good defence of the proposals of the Government, their speeches did not avail much against the cry. Oratory and argument were of little avail—the Unionists, so-called, went to the Tory meetings, the Liberals went to their own, and the waverers and weak-kneed generally stayed at home. Consequently, had it not been for the assistance given by some of the Nationalist M.P.'s in the work of canvassing, it is probable that a very large proportion of the electors would to this day be ignorant of the provisional character of the Ministerial scheme and the many important subjects reserved from the Dublin Assembly. Perhaps in days to come, when our Parliamentary elections are conducted on truly democratic lines, meetings will be arranged at which both sides of a question may be discussed.

"A great deal has been said and written on the subject of the railway vote at this Hereford election. As a matter of fact, it is very doubtful if the introduction of these side issues, important as they seemed at the moment, influenced half a dozen votes one side or the other.

"Sir Joseph Pulley, in the address of thanks to his supporters issued after the election, animadverted very strongly on the tactics pursued by the victors. He described them as 'an unparalleled combination of misrepresentation and abuse, religious intolerance inflamed by Orange bigotry and social and other pressure, amounting in some cases, I am sorry to say, to actual intimidation.' Coming from a genial and kind-hearted man, whose political career has hitherto been remarkable for its freedom from the use of epithets as applied to opponents, these words could not fail to attract attention. Unhappily in some respects they had considerable foundation in fact. For instance, there is no doubt that some of the Irish delegates employed with direful effect upon the waverers a good many of the stock Orange arguments. Equally beyond question is the fact that much social pressure was exercised during the contest, and that this sometimes degenerated into actual intimidation there is little doubt. Nevertheless it was not intimidation of this kind which lost the seat to the

Government. In a constituency where parties are so evenly divided, the step taken by Mr. Grenfell could not fail to shake the confidence of many wavering Liberals. These, added to the not insignificant number of electors whose votes are usually cast on the see-saw principle, amply account for the difference between the Liberal and Tory polls of 1892 and 1893."

The following figures show how slight is the change that transfers the seat at Hereford:—

1885	1886	1892	1893
(L.) 1360	(C.) 1401	(L.) 1507	(C.) 1504
(C.) 1296	(L.) 1136	(C.) 1380	(L.) 1460
L. Majority 64	C. Majority 265	L. Majority 127	C. Majority 44

OUR ELIZABETHAN SAILORS.

MR. FROUDE ON THEIR METHODS AND MORALS.

IN *Longman's Magazine* for September, Mr. Froude publishes his third lecture on "The English Seamen of the Sixteenth Century." There is a good deal in it which lets some curious light upon the national character, and goes somewhat far to explain the epithet, "Perfidious Albion," which is so freely supplied to us by our neighbours. One of the things to which he calls attention was the privateer fleet under the direct patronage of England, and which preyed upon Spanish shipping in the Channel. Mr. Froude says:—

This fleet was the strangest phenomenon in naval history. It was half Dutch, half English, with a flavour of Huguenot, and was commanded by a Flemish noble, Count de la Mark. Its headquarters were in the Downs or Dover roads, where it could watch the narrow seas and seize every Spanish ship that passed which was not too strong to be meddled with. The cargoes taken were openly sold in Dover market. If the Spanish ambassador is to be believed in a complaint which he addressed to Cecil, Spanish gentlemen taken prisoners were set up to public auction there for the ransom which they would fetch, and were disposed of for one hundred pounds each. If Alva sent cruisers from Antwerp to burn them out they retreated under the guns of Dover Castle. Roving squadrons of them flew down to the Spanish coasts, pillaged churches, carried off church plate, and the captains drank success to piracy at their banquet out of chalices. The Spanish merchants at last estimated the property destroyed at three millions, and they said that if their flag could no longer protect them they must decline to make further contracts for the supply of the Netherlands army.

The rest of Mr. Froude's paper is devoted to an account of the way in which Sir John Hawkins deceived the Spaniards by pretending that he had quarrelled with Elizabeth, and was willing to play the part of the traitor to his own country; he all the while being simply anxious to extricate the English seamen kept in prison by the Inquisition. The intrigue was a very daring one and was carried out by the most bare-faced lying that could be imagined. Mr. Froude says:—

You will observe the downright directness of Cecil Hawkins and the other parties in the matter. There is no wrapping up their intentions in fine phrases, no parade of justification. They went straight to their point. It was very characteristic of Englishmen in those stern dangerous times. They looked facts in the face, and did what fact required. All really happened exactly as I have described it: the story is told in letters and documents of the authenticity of which there is no the smallest doubt.

IN *Macmillan's Magazine* there are two articles upon very different subjects—one on "The Letters of Henry, the Fourth of France," the other upon "George Fox." Both are good reading.

WOMEN IN ENGLISH ELECTIONS.

FROM AN AMERICAN POINT OF VIEW.

MR. RICHARD HARDING DAVIS contributes to *Harper* for September a very lively account of a "General Election in England." He went through the general election in one of the southern counties in attendance upon a Conservative candidate. His description of the election is very interesting, and very brightly written. The only important part of his paper is that in which he criticises, from an American point of view, the conduct of women in English politics. He says:—

The part the women play in an English election is one of the things which no American can accept as an improvement over our own methods. It may either amuse him or shock him, but he would not care to see it adopted at home. The canvassing in the country from cottage to cottage he can understand; that seems possible enough. It takes the form of a polite visit to the tenants, and the real object is cloaked with a few vague inquiries about the health of the children or the condition of the crops, and the tractlike distribution of campaign documents. But in town it is different. The invasion of bachelor apartments by young Primrose Dames is embarrassing and un-nice, and is the sort of thing we would not allow our sisters to do; and the house-to-house canvass in the alleys of Whitechapel or among the savages of Lambeth, which results in insult and personal abuse, is, to our way of thinking, a simple impossibility. The English, as a rule, think we allow our women to do pretty much as they please, and it is true that they do in many things enjoy more freedom than their British cousins, but the men in our country are not so anxious to get into office, greedy as they are after it, as to allow their wives, in order to attain that end, to be even subject to annoyance, certainly not to be stoned and hustled off their feet or splattered with the mud of the Mile-End Road. Any one in England who followed the election last year knows to the wife of which distinguished candidate and to the daughters of which cabinet minister I refer.

I have seen women of the best class struck by stones and eggs and dead fish, and the game did not seem to me to be worth the candle. I confess that at the time I was so intent in admiring their pluck that it appeared to me as rather less than otherwise, but from this calmer distance I can see nothing in the active work of the English woman in politics which justifies the risk she voluntarily runs of insult and indignity and bodily injury. A seat in the House would hardly repay a candidate for the loss of one of his wife's eyes, or of all of his sister's front teeth, and though that is putting it brutally, it is putting it fairly.

It would not be fair, however, if I left the idea in the reader's mind that the women go into this work unwillingly: on the contrary, they delight in it, and some of them are as clever at it as the men, and go to as great lengths, from Mrs. Langtry, who plastered her house from pavement to roof with red and white posters for the Conservative candidate, to the Duchesses who sat at the side of the member for Westminster and regretted that it threatened to be an orderly meeting. It is also only fair to add that many of the most prominent Englishmen in politics are as much opposed to what they call the interference of women in matters political as they are to bribery and corruption, and regard both elements of an electoral campaign with as pronounced disfavour. The reply which the present President of the United States made to those enthusiastic and no doubt well-meaning women who wished to form leagues and name them after his wife, illustrates the spirit with which the interference of women in politics is regarded in this country. But then it is a new thing with us, and it is only right to remember that from the days of the Duchess of Devonshire's sentimental canvass to the present, Englishwomen have taken a part in general elections; that there is a precedent for it; and when you have said that of anything English, you have justified it for all time to come. The young American girl who would not think it proper to address men from a platform and give them a chance

to throw things at her, must remember that the English girl would not give the man she knew a cup of tea in the afternoon unless her mother were in the room to take care of her. And I am sure the women in My Candidate's campaign almost persuaded me that they, as the political agent declared, did more than himself to win the election. They did this by simply being present on the platforms, by wearing our colours, or by saying a kind word here or giving a nod of the head there, and by being cheerfully confident when things looked gloomy, or gravely concerned when the Candidate was willing to consider the victory already assured.

MR. RUSSELL LOWELL'S LETTERS.

In *Harper* for September, Mr. C. E. Norton gives some extracts from the two volumes of letters of James Russell Lowell, which he has just edited. From this article I make two extracts:—

ON SWINBURNE.

Here is a passage from a letter to Mr. Stedman:—"I have not seen Swinburne's new volume—but a poem or two from it which I have seen shocked me, and I am not squeamish. . . . I am too old to have a painted *hetaira* palmed off on me for a Muse, and I hold unchastity of mind to be worse than that of body. Why should a man by choice go down to live in his cellar, instead of mounting to those fair upper chambers which look towards the sunrise of that Easter which shall greet the resurrection of the soul from the body of this death? *Virginitas puerisque?* To be sure! let no man write a line that he would not have his daughter read. When a man begins to lust after the Muse instead of loving her, he may be sure that it is never the Muse that he embraces. But I have outlived many heresies, and shall outlive this new Adamite one of Swinburne. The true Church of poetry is founded on a rock, and I have no fear that these smutty back doors of hell shall prevail against her."

ON ENGLAND IN 1866.

Writing to Mr. Leslie Stephen in 1866, Lowell thus expresses himself in a letter, which showed how deep was the feeling of resentment occasioned in his patriotic breast by the conduct of England at the Civil War:—

"I confess I have had an almost invincible repugnance to writing again to England. I share with the great body of my countrymen in a bitterness (half resentment and half regret) which I cannot yet get over. I do not mean that, if my heart could be taken out after death, *Delenda est Anglia* would be found written on it—for I know what the land we sprung from, and which we have not disgraced, is worth to freedom and civilisation; but I cannot forget the insult so readily as I might the injury of the last five years. But I love my English friends none the less—nay, perhaps the more, because they have been *her* friends too, who is dearer to me for her trials and for the victory which I am sure she will be great enough to use gently. There! like a true New-Englander I have cleared my conscience, and I can allow a little play to my nature. . . .

"I am desired by the American Eagle (who is a familiar of mine caught on the coins of my country) to request you to present her compliments to the British Lion, and say to him that she does *not* (as he seems to think) spend *all* her time in trying to find a chance to pick out his eyes, having vastly more important things to occupy her mind about. She really can't conceive how they can quarrel when *his* place is on the ground and *hers* in the air—a moral on which she begs him to meditate. She doesn't wish to change, having a natural fondness for large views. 'As for Femians,' she adds, 'tell him to spell it Faintaunts, as we do over here, and he will enjoy his dinner again.'"

THERE is a paper on Siam in the *Californian Monthly* for August, written by E. Carrington, and another paper by Mr. J. Cheney on "William Blake."

THE DEGRADATION OF THE PRESS.

FROM AN AMERICAN POINT OF VIEW.

MR. JOHN G. SPEED, in the *Forum*, writes a very interesting article in answer to his first question, "Do Newspapers now Give News?" He maintains that they do not, and he asserts that there has been visible a very palpable deterioration in the character of the news circulated in the American Republic since Mr. Pulitzer took over the *New York World*. The newspapers have drivelled down into mere scandal-mongering gossips. A table which Mr. Speed has drawn up brings this into very clear relief:—

THE CHANGES OF TWELVE YEARS.

For the purpose of comparing the various kinds of subjects treated in the papers of the different dates, I have made the following table:—

COLUMNS OF READING-MATTER IN NEW YORK NEWSPAPERS, APRIL 17, 1881, AND APRIL 15, 1893.

Subject.	<i>Tribune</i> , 1881.	<i>Tribune</i> , 1893.	<i>World</i> , 1881.	<i>World</i> , 1893.	<i>Times</i> , 1881.	<i>Times</i> , 1893.	<i>Sun</i> , 1881.	<i>Sun</i> , 1893.
Editorial . . .	5.00	5.00	4.75	4.00	6.00	5.00	4.00	4.00
Religious . . .	2.00	0.00	0.75	0.00	1.00	0.00	0.50	1.00

Art	1.00	1.00	3.00	3.00	2.00	0.00	0.25	1.25

Mr. Speed says:—

So while there has been a distinct deterioration and decadence in the New York newspaper press in the last dozen years, the improvement in Chicago has been steady and noteworthy, and this notwithstanding the introduction and general adoption there of the illustrations that do not illustrate. There is a conventional phrase—"a newspaper is the history of the world for a day"—that is more or less believed in. Nothing could be falser than this. Our newspapers do not record the really serious happenings, but only the sensations, the catastrophes of history.

A PLEA IN MITIGATION.

"The Defence of the Newspaper" is taken up by Mr. C. R. Miller, of the *New York Times*. He says what can be said for the New York press without really meeting the point of Mr. Speed. He says:—

Let me say, however, that a newspaper that intentionally and as a matter of policy purveys matter acceptable to low and vulgar tastes, a newspaper that is habitually unclean, sensational, untrustworthy and ill-bred, deserves all the denunciations that the most violent critics of the press may visit upon it. Lay on, gentlemen, and spare not. But pray discriminate. Don't accuse a newspaper of pandering to low tastes because it prints matter intended for the edification of persons not in your set.

Mr. W. K. Keller, President of the New York Press Club, writing upon "Journalism as a Career" confirms, so far as he goes, the melancholy impression left by Mr. Speed's essay. The world, the flesh, and the devil seem to be having it all their own way in the New York press, judging by the utterances of these competent authorities:—

HAMMON SUPREME!

The domination of the business-office over the editorial department is a development of recent years; the natural consequence of the gradual evolution of journalism into a purely money-making business. A vast majority of the capital invested in journalism was not made from journals or furnished

by journalists. Nearly all the money with which newspapers successful and unsuccessful, have been started in New York, has come from sources entirely alien to journalism itself.

THE DISADVANTAGES OF JOURNALISTS.

Mr. Keller thus describes some of the drawbacks which are to be faced by Americans who contemplate making their living on the press:—

The disadvantages of journalism as a permanent vocation are the limitation to income, the insecurity of place, the comparative impossibility of ever working except for hire, the impersonality of the work, the absolute power which the newspaper has over the newspaper man, the constant drain upon both mental and physical forces, and the fact that old age is almost as fatal to employment as death itself. Another serious disadvantage, and by no means the least, is the jealousy and envy which obtain among newspaper men.

SALARIES OF THE PRESS.

The average income of reporters working for the New York newspapers is really less than two thousand dollars per annum. Copy-readers average about the same. The various heads of departments, such as dramatic, musical, sporting, foreign and exchanges, range from two thousand dollars to three thousand five hundred dollars; editorial writers from two thousand five hundred dollars to four thousand dollars; city and Sunday editors from three thousand dollars to five thousand dollars; and managing editors from five thousand dollars to fifteen thousand dollars.

THE USING UP OF YOUNG LIFE.

Journalism is essentially a business for young men. They rush into it by hundreds, they remain in it by tens. Ninety per cent. of the men who enter journalism leave it before they become old. They remain in it only long enough to make it a stepping-stone to something else less exacting, less limited in remuneration, less insecure in employment. On the staff of the daily newspaper with which I am connected there is only one man over fifty years of age, and the average age of the employes in the editorial department is less than thirty-five.

Where do these men go when they give up newspaper-work? They are to be found chiefly in politics or the theatrical business, two pursuits closely allied to journalism, although the law entices many and strictly commercial pursuits a few. A vast number die in the service before they grow old. The death-rate is high among newspaper-workers. This is a business which knows no Sabbath, no holiday, no day of rest.

The Medical Education of Women.

ALL who have watched the steady, though slow, progress of the movement in favour of affording to women a thoroughly good medical education, will be interested to know that the managers of the Royal Infirmary in Edinburgh have resolved to authorise the provision of a qualifying number of beds for the clinical instruction of women students. The women students have been working in a most satisfactory way in the Royal Infirmary for nine months, but the examining board of the triple qualification having decided that the number of beds set aside for the instruction of women students was insufficient, the board of management of the infirmary intimated that the clinical teaching of women students was to be discontinued after October 1st. The Scottish Association for the Medical Education of Women appealed to the infirmary managers to reconsider their decision, at the same time pledging itself to raise a substantial sum of money to aid in fitting up the new wards. This offer is now accepted, and the managers deserve credit for forwarding this rapidly progressing movement. The Scottish Association has not pushed this matter for its own students only, but for all women preparing for the medical profession. The College of the Scottish Association is at 30, Chambers Street, Edinburgh.

A QUEEN'S CHARITY.

THE EVANGELISMOS OF ATHENS.

In the *Nouvelle Revue* of the 15th August Madame Lascaris gives a charming account of Queen Olga's practical charity and goodness of heart, and also throws an agreeable side-light on the manner in which the Athenian ladies of high degree occupy their spare time.

Before King George brought his Russian wife to Greece, charitable institutions were practically unknown in the land of Homer. In times of illness the wealthy Athenians and country gentry were at the mercy of a number of Mrs. Gamps, and for the sick poor no kind of provision was made by the State. As long ago as 1872 a few Greek ladies founded a kind of Nursing Society; three years later Queen Olga consented to become President, and gave out of her private purse the sum of 30,000 drachms for the foundation of a Nursing School. She soon became aware, however, that what was really wanted was some kind of hospital, where the poor could be attended to gratuitously, and which would in itself become a most practical school for nurses. Without losing any time Queen Olga organised a committee, presided over by the Metropolitan of Athens, and in response to the appeal sent out, a sufficient sum was at last forthcoming to begin the Evangelismos, as the hospital was named by wish of the Royal Family. The first stone was laid by the King on the 25th of April, 1884, and the hospital can now accommodate one hundred and thirty in- and sixty out-patients.

The Evangelismos consists of three distinct buildings connected by covered passages. The whole of the management of the hospital is confided to a Council of Administration, composed of seven ladies, who meet weekly and take it turn and turn about to spend the morning at the hospital seeing that all goes well in each department. The wards are spacious and each contains two ventilators; a feature is made of the bathing and hydro-therapeutic appliances. Although not bound by any vow, each nurse is only allowed to enter the Evangelismos after she has gone through a kind of novitiate, fitting her for the duties of her future life. If, after this preliminary trial, she is still desirous of entering the Evangelismos, she is obliged to sign an engagement not to marry for six years.

Every nurse receives a salary of thirty drachms a month, plus a sum of one hundred and eighty drachms at the end of each year. A certain percentage of this salary is kept back by the Administration, and given with compound interest to each nurse in the establishment.

The nursing-staff consists of twenty-six members, and there are two house-doctors and two consulting physicians. Madame Syngros, the wife of a great Athenian merchant, is practically the matron, although she does not live in the hospital.

Entirely supported by voluntary contributions, the smallest sum received passes directly through the hands of the Queen before being given to the treasurer. A certain number of apartments in the hospital have been set aside for paying patients; this has proved a great boon to those strangers who, falling ill in the Athenian hotels, would not be properly nursed were it not that the Evangelismos offers them a safe and comfortable haven for the moderate sum of about eight shillings a day.

Queen Olga is a constant visitor, both to the wards of the hospital and to the Government Infirmaries, which have been established through her energy. As is but natural, she takes an especial interest in the poorer Russian patients, for the Evangelismos makes no distinction of race or creed, although the chapel attached to

the establishment is, of course, Greek Orthodox; but the texts, which, by the Queen's wish, are to be found all over the building, are each but a repetition of the Divine precept, "Love one another."

MR. COBDEN AT HOME.

AN AMERICAN'S VISIT TO MIDHURST.

In the *Overland Monthly* for August, Mr. J. M. Scovel describes a visit which he paid to Mr. Richard Cobden in the middle of the American Civil War. Mr. Scovel visited Paris and London, and thus sums up the impressions which he received from each capital:—

London gives one an impression of stability and of power. Paris is France, and in Paris all France seems to look down upon you, not "from the Pyramids," but from the shop windows.

MR. AND MRS. COBDEN.

Being invited to visit Richard Cobden at Midhurst, he took the train at Waterloo, and drove over from Haslemere to Midhurst, and from thence to Dunford. He is very enthusiastic about his host and hostess:—

Richard Cobden was an exemplification of the truthful saying attributed to Coleridge, that he never knew a "truly great man that had not more or less of the feminine element in him." After accompanying me to the guest chamber, we came down to supper together and enjoyed a substantial meal, not forgetting a rare glass of old Madeira. Of the household I saw only Mrs. Cobden that evening,—a noble woman, with what Tennyson calls "quiet eyes still faithful to the truth." She had been her husband's companion during the bitterest of the strife attending the Anti-Corn Law agitation. In the morning before I left Dunford, we had a conversation which I may yet give the world, but not here. He was answering his letters as early as seven o'clock in the morning. As his five daughters came to the breakfast-room, each one saluted him with a kiss. An artist might gladly paint that picture of domestic happiness and contentment.

ON THE ENGLISH LABOURER.

Mr. Scovel reports at some length many remarks made by Mr. Cobden upon American and English affairs. He says:—

Cobden gave me to understand that a large investment had been made by him (Cobden) in the State of Illinois, and he once cherished the idea of coming to America to live, with an eye to the United States Senate. He soon abandoned the idea, believing the true work of his life was in England. He seemed most solicitous about the condition of the English peasantry, and more ready to converse upon this subject than any other. His fine eyes filled with tears as he explained to me the fearful ignorance and destitution among so many thousands who could never hope to turn a furrow of land which they might call their own. It was here the character of the man shone clear as day. He said there was no class in England, as there was in America, who, if they did not at first own their land with thrift and reasonable economy could soon become owners in fee of as many broad acres as they could cultivate. He talked on this subject till after midnight, deploring the fact that the English peasantry were divorced from the land on which they lived. He named his neighbour, Lord Lincolnfield, who owned a park with twelve miles of stone fence protecting it, its owner too rich to spend the half of his income, and rich enough to buy all the land within a day's ride of him.

The last political prediction I heard Cobden make was, that the laws regulating the tenure of lands must change (and while he might not live to see it I would), I would live to see a revolution which would for ever settle all disputes between English landlords and tenants. This question of elevating this disfranchised class, he said, was the one nearest to his heart.

That revolution has not yet taken place, but as the writer is still living, Mr. Cobden's claims to be a prophet may yet be vindicated.

THE CHINESE CONQUEST OF EUROPE.

A VISION OF 1899.

MR. W. W. CRANE in the *Overland Monthly* for June, in a paper entitled "The Year 1899," sketches for the consolation of the Caucasian the campaign which the Chinese and Asia generally undertook for the conquest of Europe and America. On the American side there is no need to dwell, beyond remarking that the Chinese prepared for their campaign by fraternising with the negroes. Notwithstanding this, and notwithstanding the landing of a horde of a million Asiatics on the Pacific Slope, the Chinese did not make much headway in the Western Continent. It was far otherwise in Europe. The following extract will give the reader an idea of Mr. Crane's lively imagination.

THE ASIATIC LEAGUE.

Two immense armies had gathered on the borders of Europe:—one in Asia Minor and the other around the northern shore of the Caspian Sea. The first, made up of Indo-Chinese, Hindoos, Afghans, Beloochees, Persians, Turka, Arabs and Turkomans, was directed by a Hindoo prince, and a dervish from Bokhara who claimed descent from Tamerlane. The other was all Altaic, and was led by a Chinese general and Kara Hoolakoo. Over both camps floated thousands of black felt banners, and every man in either host was arrayed in a uniform of the same ominous colour. Before the end of April both armies advanced at the same time.

THE CONQUEST OF RUSSIA.

A hastily collected and ill-organised force of Russians trying to withstand the first wave of the Altaic deluge near Saratoff, was almost annihilated, and the scattered fugitives who escaped spread terror far and wide in their flight. The panic was like that caused by an earthquake or a tidal wave. No further organised resistance was offered anywhere. The two great human floods rolled on unchecked, living on the country, butchering all who could not escape, and leaving desolation behind them. "The blacks are coming!" was the horrified cry in their front, and in the wild rush westward, starvation, exhaustion, and fear brought death to many of those who were flying to avoid it. The invaders destroyed every vestige of Christian civilisation wherever they came, all the different kinds of fanatics joining in a common frenzy of hatred against the sign of the cross.

The commissary arrangements of the whole invading host were controlled by Chinese officials and Hindoos who had served under the British Government. They saw that the captured supplies were kept in good condition and carefully distributed. Accustomed to living on the scantiest fare, the Asiatics would have been satisfied with less than they received. Their natural habits, their slight value of human life, and their wild religious enthusiasm made them soldiers who could hardly be excelled.

THE EXTINCTION OF FRANCE.

The two armies met in Germany and together poured into France, against which the Chinese had long been harbouring a special hatred. In every French city, town, and village not one stone was left on another. The country was overhung by a dusky pall of smoke, beneath which the only visible habitations were the black tents of the destroying host. The people had fled to England, to the north-east, or to the south, and detached masses, said to number five hundred thousand each, were sent to pursue them in the second and third directions. North Africa had joined the league as soon as it showed its strength, and an army from the Barbary States crossed the Straits of Gibraltar, while the invaders from the north were swarming over the Pyrenees. Some of the whites in Spain and Portugal escaped to the neighbouring islands or hid themselves in the mountains, but their number was comparatively small. Here and there bands of men and women, driven to bay and hopeless of quarter, sold their lives at a dear price: but in most cases it was mere butchery, and of

that the black-clad hordes were never weary. They seemed bent on crushing the white race out of existence, and in a little while they had left no visible trace of it between the Mediterranean Sea and the Atlantic Ocean. Leaving the Africans to found a New Grenada, the Asiatics returned to France to take part in the preparations for attacking the British Islands.

THE ADVANCE ON BRITAIN.

In England the same preparations had been made, but on a larger scale. Peace had been made with Ireland, and the Irish in large numbers took active part in the work of making ready to meet the common foe. Here too a numerous body of refugees joined the home defenders. From forts, earthworks and entrenched camps, a long line of guns pointed seaward, and every available warship steamed back and forth from Beachy Head to the mouth of the Thames, keeping a close watch on the north-western French ports. The enemy was preparing a flotilla of long and wide boats, in which they expected to row across the intervening arms of the sea. They were working with the never-flagging steadiness of ants and bees, and though broadsides from venturesome ships smashed some of their half-built boats, and made gaps in the swarms of workers, they went on as if it had been nothing more than a peal of thunder. So things stood in Europe at the end of September in that memorable year, 1899.

The Chinese and the Moslems quarrelled, and the remnant of Europe was saved. The paper is interesting chiefly because it brings out so clearly the impossibility of the danger it describes.

PARTICIPATION VERSUS EXTENSION.

AN AMERICAN SUGGESTION FOR OUR UNIVERSITIES.

MR. A. B. HART, in the *Educational Review* for June, thinks that University Extension is not by any means everything that it should be. He proposes to supplement it by what he calls University Participation. He says:—

It is, of course, difficult to lay down with confidence the details of a scheme somewhat complicated and dependent on the co-operation of colleges with school boards, superintendents, teachers, and the general public. But it seems altogether possible to draw up a general plan of teachers' normal courses which shall be offered by colleges, and to which the name "University Participation" might not unreasonably be applied. It should be based on the following general principles:

1. The object should be training, and the training of teachers already in service.
2. The subjects ought to be those commonly taught in primary and grammar schools, with some reference also to secondary schools.
3. The methods ought to be active and scientific, including the use of apparatus, collections, and libraries.
4. The expense must fall in the long run in considerable part on the universities.

A feeling of responsibility in this matter has sprung up simultaneously in several different colleges.

In spite of the many practical difficulties stated, and many others undiscovered, the advantages of university participation are obvious. For the schools the system will facilitate, and in some cases alone will make possible, the remodelling of the curriculum; and it will add daily to the interest and efficiency of the teaching. To the teachers the system promises a relief from the endless monotony of ordinary class exercises, and gives them a broader and surer hold upon what they are doing. The normal schools will be stimulated if it be found that their graduates are, in the power of teaching the ordinary subjects, inferior to those who have had the training courses. To the colleges the system will be of great advantage, for the instructors will gain the clearness of understanding which arises from meeting difficulties suggested to the minds of others, and preparation will be improved. To the country it will aid in the advance of learning, for it will help the study of each subject from the beginning to the highest point of specialisation.

THE NATIONAL PARK OF THE UNITED STATES.

ONE of the best articles in a recent number of the *Revue des Deux Mondes* is that in which M. Léo Claretie describes what he styles "The National Park of the United States." This "park" is as large as a third of Belgium, and is situated in the heart of the Rocky Mountains, shut in on all sides by a rampart of peaks and glaciers, and until the year 1870 nobody seems to have known anything about it.

THE FIRE HOLE, 1870.

On the 19th of September, the very day, the writer points out, when the Prussian army was marching round Paris, a small company, under the guidance of General Washburn, came to a standstill on the borders of the great geysers now known as the Fire Hole. They were seeking for a lost companion, a certain Mr. Everts, who had wandered away and lost himself. For twenty long days the others called his name aloud to the echoes of the Rocky Mountains; they fired shots, and set fire to great tracts of forests, and sent out horsemen in every direction; but when at last they found him he was utterly exhausted and half distraught, having gone through terrible adventures, being without ammunition, without food or covering, sleeping near the springs of hot water during the chill nights, and boiling the roots of thistles for his food, while seeing whole flocks of game cross his path, but being without means to capture them. During the whole of one night he was watched by a Californian lion, having nothing upon his person but an eyeglass, with which he lit dry wood by the rays of the sun. But Mr. Everts's adventures were destined to lead to a great discovery, for while seeking for him General Washburn and his escort came upon what was to them a strange land in their own country. During the nights they were obliged to light great fires, and to keep two sentinels watching lest they should be attacked by lions or Sioux Indians, so wild and lonely was the region of which twenty-two years ago the world knew nothing. Even in 1877 a band of Blackfeet, commanded by the chiefs Looking-glass and Whitebird, massacred eight tourists encamped upon the borders of the Fire Hole.

AFTER TWENTY-THREE YEARS.

To-day this tract of country is furrowed by roads which are traversed by more than 15,000 tourists every summer. They there find comfortable hotels lighted with electric light, horses in relays, service at certain points as good as that in Switzerland, the post, the telegraph, and well-made roads. Travellers come from every quarter of the globe, and the ladies change their toilets three times a day.

It had been known, by the stories of hunters who had escaped from Indian arrows, that all sorts of phenomena took place in the interior of an immense circle of mountains in the Far West; the cowboys, seated by bivouac fires, told of frozen rivers which suddenly began to boil, and of glass mountains containing petrified forests, where were to be seen magnificent palaces, temples with festoons of pearls, battlemented towers, smoking furnaces, hissing cauldrons, walls of gold, terraces of marble and of onyx. Yet all these wonders were hardly more astonishing than the truth.

HELL'S HALF ACRE.

In the National Park of America the mineral world has it all its own way. Some geysers throw up sulphur, so that silver dollars immersed for a few minutes turn up gold, while the petrifications caused by others are white and pink. One old geyser is covered by a solid cap of

stone: it has created its own tomb. In another part of the park the noise and the steam are as if the traveller were approaching a great manufacturing district; but there are no mills, foundries, or factories. The Indian tribes were convinced that the interior of the ground was hell, and that the steam of the geysers was the breath of the devil. One spot rejoices in the name of "Hell's Half Acre," for the soil is red, and woo to anyone who tumbles into a hole, for there have been some sad accidents. One great smoking hill is called the "Tea Kettle," while another rejoices in the name of "Old Faithful," from the regularity of its outbursts. This crater is on the top of a great mound of chalk. The colours of the ground and of the waters are extraordinarily diverse—yellow, red, and green. A large lake, the highest in the world, is really like an immense inland sea, and not far from its shores can be seen the astounding image of the "Sleeping Indian," a huge figure lying upon the mountain side, its profile resembling that of the first Napoleon.

HOW TO GET THERE.

It was on March 1, 1872, that a vote of Congress declared that this wonderful tract of country should be national property for ever. No one can squat upon it, nor purchase land, nor hunt over it; if a tree falls across the road which hinders traffic, it is removed, but no one may touch a branch without permission.

From Chicago the place is reached in forty-eight hours, in trains which are luxurious and comfortable, though there is no important town upon the line except Saint Paul, Minneapolis, etc., etc. On the second morning the engine stops at a point of junction named Livingstone, a little settlement where the trains for the Atlantic and the Pacific meet and cross. A golden rivet is let into the rail at the point where the workmen soldered up the two halves of the mighty line which unite two oceans and two hemispheres. Travellers bound for the park descend here, and branch off on a little local line which links Livingstone to Cinnabar, the terminus of the iron road. In the park there is no railway to desecrate the tract of primitive land."

From Cinnabar the tourists take three mail coaches with eight horses apiece, and enjoy a wild and delightful drive, till they are received at the Mammoth Hotel, now one of the sights of the park, and are taken round, forty at a time, the trip taking seven days. For how many centuries will the United States preserve intact this isolated square of territory, savage, terrible, beautiful, and, except for its roads and sleeping places, absolutely untouched by the hand of man?

A Novelist's View of American Society.

MR. MORLEY ROBERTS, who writes about his first book in the *Idler*, does not speak kindly of the United States of America, only so far as they are unpeopled. He says:—

In speaking as I have done about America, I do not mean to praise it as a State or a society. In that respect it is perhaps worse than our own, more diseased, more under the heel of the money fiend, more recklessly and brutally acquisitive. But there are parts of it still more or less free; Nature reigns still over vast tracts in the West. As a democracy it is so far a failure, as democracies must be organised on a plutocratic basis; but it at any rate allows a man to think himself a man. Walt Whitman is the big expression of that thought, but his fervent belief in America was really but deep trust in man himself, in man's power of revolt, in his ultimate recognition of the beauty of the truth. The power of America to teach lies in the fact that a great part of her fertile and barren soil has not yet been taught, not yet cultivated for the bread which of itself can feed no man wholly

A DREAM OF A PURITAN ROME.

BY MR. RAYMOND BLATHWAYT.

MR. RAYMOND BLATHWAYT has a paper in the *Pall Mall Magazine* on "Rome in America," which is a curious example of a continued dream. I began the dream, and dreamed in my "Vatican and the New Era" a gorgeous vision of a regenerated Papacy undertaking the Director-Generalship of the world in all good works. Mr. Raymond Blathwayt has continued my dream, and in this article we have a not less imposing vision of Rome, not merely regenerate, but Puritan!

ROME AND THE REPUBLIC.

The article is the result of a visit which Mr. Blathwayt paid to the United States, and he certainly appears to have made good use of his time in sojourning among the prelates and personages of a new world. Mr. Blathwayt says:—

Here the Church is on her trial as she has never been since that moment when she first reared her temples amid the palaces and glories of Imperial Rome. Here, for the first time in the history of the world, and with a sharpness of contrast hitherto unseen, the old and the new are confronted with one another. Here face to face they stand—the Grand Old Church, the Glorious Youthful Republic; and meanwhile the world looks breathlessly on. For a crisis is at hand. This is a tide in the affairs of Rome which, if she takes it at the flood, will lead her on to such fortune as even she has never before experienced.

ROME EMANCIPATED BY AMERICA.

After describing the ideal of a Church, Mr. Blathwayt proceeds to prophesy:—

If all her ideals are carried out in their entirety, it goes without saying that the Church will speedily become an important, if not the most important, political factor in the Republic. She will become a factor that will not permit itself to be left unreckoned with in the calculations of any politician, or body of politicians, desirous of exercising an influence either for good or evil in the States—a factor that more than any other in American politics will go towards the construction and the maintenance of unity in the Republic. Rome, say what we may, and however much we may dislike or seek to explain away or absolutely deny the fact, Rome, nevertheless, is the one great Church—the one vast political as well as ecclesiastical organisation that speaks with authority—with a voice that *will* be heard. And especially must it be remembered that the Church in the Republic I am so fondly depicting will be, not the Church of Mediævalism, or of the Imperial City, or even of the Vatican of to-day. Rome in the Republic will be American Rome; it will be Puritan Rome, it will be emancipated Rome. It will not be Rome as we have hitherto known it, hampered and fettered by canons and rules centuries old, and altogether and hopelessly incompatible and out of touch with the spirit of to-day. It will be Rome Americanised—in other words, frankly democratic. And I believe that the day will come when, if she will but act up to her loftiest ideals, and in accordance with her noblest traditions, Republican Rome, Puritan Rome, will dominate, not the United States only, but the whole English-speaking world.

AND THEN DOMINANT IN THE NEW WORLD.

He concludes his article by declaring that he believes his prophecy will come true, and that Rome, the Mother of the world, is going to be the Church of the United States of America. He says:—

Cardinal Gibbons and his assistant prelates realise the intense importance, if the Church is really to carry out her mission in its entirety, of Americanising and nationalising as rapidly and completely as possible bishops, priests, and people, remembering always that the spirit of the Church is to be the Church of the nation in which she works.

And now is her dream on the very verge of actualisation.

Her prelates are not foreigners; they are not aristocrats; they are Americans to the core, attached heart and soul to the principles of democracy, seeking only to build up each and all into the true union of the Republic. Their one desire is to see a free Church in a free country, teaching to the varied inhabitants of that country the universal brotherhood of man and the all-fatherhood of God, without which, as both they and I hold, no Republic can hope to exist. And if the Church but succeed in the carrying out of these her ideals, she will no longer be the Church in the Republic, but the Church of the Republic beloved of all her children,—Rome, the Mother of the world.

Mr. Blathwayt, by-the-bye, having for the moment ended his interviewing and prophesying, is about to make the tour of the world with a limelight lantern and a boxful of slides. After having interviewed very nearly everybody who was worth interviewing in the Old World and the New, he is now going to describe to the great public what celebrities look like at home—how they talk and what they say. His lecture ought to be one of the most popular of the round the world series.

CONVERTS TO ROME IN AMERICA.

THE *American Catholic Quarterly Review* for July publishes an interesting article by Dr. Richard H. Clarke on "Our Converts." It is for the most part composed of several pages of names of notable Americans who have come over to the Roman Church. Dr. Clarke says:—

The convert element in a Catholic population of 14,000,000 in 1893 is estimated at 700,000, which shows the glorious and triumphant gains of the Church from the Protestant sects. It is a significant fact that few converts have been made by the Catholic Church in this country from the ranks of infidelity, atheism, deism, and other schools rejecting Christianity. The Protestant sects, those professing Christianity and struggling for the light of truth to the best of their opportunities, have yielded up to the Church, from the bosom of error, this goodly army of sincere and devout Catholics. Episcopalians by their love of religious antiquity and episcopacy, Presbyterians by their ardent advocacy of the principle of ecclesiastical authority, Methodists by their intense culture of the personality of God and of the Saviour, Puritans by their hatred of Erastianism and opposition to what they took to be idolatry, the zeal of Evangelicals against mere formal religion, and other sects, while blindly rejecting many revealed truths, yet cherishing some particulars of true religion, have proved themselves nurseries of conversions and promoters of some beautiful features of Christian truth, and probably themselves may prove to be the links by which all Christians will some day be brought into the one fold of Christ. When we consider the extent of this element of converted Catholics only in our own country, there is great and pregnant hope for a united Christendom.

When it is considered that the body of American converts have given to the Church eleven of her eminent members of the hierarchy, and including Bishop Northrop, the son of a convert, twelve, and four of these were archbishops, we must acknowledge, not only the numerous constituency standing at their backs, but also the zeal, the faith, the learning, the charity, the fidelity, the apostolic spirit, which pervade the entire body of American Catholic converts.

THE *London Philatelist* publishes a paper by Mr. E. J. Nankivel on the stamp auction season of 1892, from which we learn that five auctioneers last year sold postage stamps to the amount of £27,000. The highest price paid for a single stamp was £202, which was the sum secured by J. W. Scott and Co for a British Guiana stamp. There were forty-three sales held by five leading auctioneers, producing an average of £200 a lot. Altogether the sum invested in postage stamps during the season of 1892-93 must have considerably exceeded £30,000.

NONCONFORMISTS IN THE CHURCH.

A SUGGESTION BY THE ARCHDEACON OF LONDON.

In the *Sunday Magazine* for September there is published an interview with Archdeacon Sinclair, which is very readable, and gives a vivid and interesting account of one of the rising clerics of the day. Archdeacon Sinclair is a Scotchman, comes from the extreme North, and he has charge as Archdeacon of 250 parishes, with a population of a million and a half!

He is a devoted cyclist, but he prefers the tricycle to the bicycle:—

In the August of 1891 he went down on his tricycle to Thurso from London, doing the 730 miles in sixteen days.

In London he has not much time for tricycling.

Here is his "timetable" roughly: he comes down to family prayers at half-past eight o'clock; from 9 to 10 he is occupied with his correspondence; from 10 to 11 is devoted to the service at the cathedral; business letters and interviews engage his attention from 11 till 1, when he dines; from 1.30 to 4 archidiaconal and other business is again his task; from 4 to 5 is given to the second service at the cathedral; then he goes out on business or duty; and when he returns he spends the evening until midnight over business letters or private papers.

Answering a question from his interviewer, the archdeacon says that the morning services in St. Paul's are usually attended by 100 persons; in the afternoon about 400, with the exception of Saturday, when the congregation rises to 700. On Sunday, the morning attendance is 2,500; the same number attend in the afternoon, but the evening service is the best attended, the congregation numbering 5,000, the cathedral being quite full.

Of the interview, the most important part is that which sets forth Archdeacon Sinclair's ideas as to the steps that should be taken to bring about a closer connection between the Church and Nonconformity.

Dr. Sinclair at once confesses that an enormous difficulty stands in the way of any interchange of pulpits or anything approximating to an inter-working which would involve any participation of Nonconformists in the affairs of the Established Church. "A great Organisation like the Church of England," he observes, "sticks very closely to its rules. When the Church will not permit a laymen of its own, who can represent it in mission-house, to preach in its regular pulpits, what hope can be entertained that Nonconformist ministers will be permitted to there appear? Even suppose this difficulty of

the Act of Uniformity out of the way, there would arise the further difficulty of determining what bodies of Nonconformists are more or less in accord with the main principles of the Church of England. The initial objection, however, was all-sufficient. The proposal that Nonconformist ministers should be admitted to Church pulpits would give the most serious offence to the High Church party; and altogether he did not regard it at present as within the region of practical politics.

The support extended by the Nonconformist bodies to the Disestablishment campaign Dr. Sinclair accepted as a great bar to the accomplishment of a real harmony.

"Something, however, might be done hereafter, but in the meantime," Dr. Sinclair said, "can the Nonconformists suggest any plan by which they can be included in the great body of National Christianity? We should welcome the

consideration of such a scheme with enthusiasm. For my own part, I am content at present, speaking generally, to aim at mutual understanding in the bonds of peace, leading to consequences which cannot for the moment be foreseen; but I shall be pleased to hear of any proposal which contains the germ of closer unity and greater usefulness. It has often occurred to me of late that the time has arrived for another conference between the leaders of both sides, such as that held at the Savoy in the reign of Charles II., and that held at Hampton Court under James I. Such a conference, as the minutes show, would be strictly in accordance with the spirit of the resolutions on Christian unity passed by the last Lambeth Conference in 1888."

ARCHDEACON SINCLAIR.

A German Gospel.

THE REV. C. C. STARBUCK, in the July-August number of the *Andover Review*, publishes the first part of an

interesting paper upon "Missions and Colonies." In the course of his remarks he calls special attention to the way in which the German Missions are being used for political purposes:—

The Protestant missions in the German colonies, especially in Africa, are now in especial danger at the hands of their Protestant governors, who are endeavouring to depress them into the instruments of government policy. They want the missionaries to put two things in the foreground,—first, to preach the supreme authority of the Kaiser first, last, and midstmost; second, to teach the negroes that the chief end for which they were created was to work for the white men. After that, they are welcome to throw in at odd times such trifles as faith, hope, and charity, chastity, and care for their families.

HOW LONDON WAS DESTROYED.

THE DOOM OF THE GREAT CITY.

THE *English Illustrated Magazine* for August publishes another instalment of Mr. E. Douglas Fawcett's sensational and horrible story, "Hartmann the Anarchist," which describes how London was destroyed by a flying machine which showered dynamite bombs, shot and shell, and blazing petroleum from the clouds. After describing how they smashed an ironclad at sea as a kind of preliminary experiment, the novelist gives the following vivid description of how the work of destruction was begun.

THE RAIN OF DYNAMITE.

The *Attila*, in which Hartmann the Anarchist returned to take vengeance upon London, soared like a great vulture above the clock tower, the blood-red flag being unfurled at its stern, with the legend, "Thus returns Hartmann the Anarchist," amid a salute of four quick-firing guns. A great labour demonstration was being held at the time, and the procession was crossing Westminster Bridge. When the flag was unfurled Hartmann soared aloft and cruised round high above the clock tower in large circles. The story proceeds:—

Once more the quick-firing guns vomited flame, and this time the charge was not blank. And mingling with their almost continuous roar, there now came a crash of appalling magnitude, shaking the very recesses of one's brain. Another and another followed, till the air seemed to beat in waves upon us and our ears became veritable torture chambers. Then followed a rattle like that of a landslide. I looked over to start back with a shriek. Horror of horrors, the great tower had fallen on the crowd, bruising into jelly a legion of buried wretches and beating into ruins the whole mass of buildings opposite. Every outlet from the neighbourhood was being furiously fought for, hordes of screaming, shrieking madmen were falling, crushing and stamping their victims into heaps, and with the growth of each writhing heap the ghastly confusion grew also. Of the Houses of Parliament pinnacles were collapsing and walls were being riven asunder as the shells burst within them.

But this spectacle, grievous of its kind, was as nothing to the other. With eyes riveted now to the massacre, I saw frantic women trodden down by men; huge clearings made by the shells and instantly filled up; house fronts crushing horses and vehicles as they fell; fires bursting out on all sides, to devour what they listed, and terrified police struggling wildly and helplessly in the heart of the press. The roar of the guns was continuous and every missile found its billet.

THE DELUGE OF PETROLEUM.

After spending the morning in devastating Westminster, the *Attila* turned her course eastward and devoted the afternoon to the destruction of the city. The Tower was the first to be destroyed, then a tempest of bombs fell upon the banks and the Stock Exchange, while St. Paul's dome was riddled with shot and fell with a frightful crash. Up to this time no injury was inflicted upon the crew of the destroying vessel; but after St. Paul's was destroyed one of the crew was shot through the throat, and in revenge Hartmann decided to let loose a tank of blazing petroleum upon the mob:—

Down we swept like a hurricane over the yelling, maddened throngs massed in Farringdon Street. Suddenly I heard a sharp cry.

"Stand off!" I had hardly time to draw back when a column of flames shot up the side, reddening the very bar I had been clutching.

"Let go!"—a crash, the column vanished, and a stream of fire like a comet's tail drew out instantaneously in the wake of the *Attila*. It was the petroleum. The first tank had been lighted, its contents shot over the shrieking wretches below!

For full fifty to sixty yards the blaze filled the roadway, and the mob, lapped in flame, were writhing and wrestling within it. A fiendish revenge was glutted.

Leaving the city, the *Attila* turned towards Kensington. The Anarchists in London were kindling incendiary fires in parts of the metropolis; the West-end was looted, and hell was let loose everywhere; floods of blazing petroleum were rained down upon the doomed city.

THE DESTROYER DESTROYED.

The story of the "Cruise of the *Attila*" is finished in the September number of the *English Illustrated*. The narrative describes how after using up nearly all his petroleum and emptying his powder magazines, the Anarchist had only destroyed about one-fifth of the city. Society rallied; his confederates who were caught looting and setting fire to houses were promptly shot, and he received information that his mother had been one of the first victims fatally injured by his aerial campaign. The concluding scene is thus described by a spectator, who watches the aeronaut through a glass:—

"Hallo! he comes up again with a revolver in each hand. He closes the gate of the outer wall of the citadel, and seems to harangue the crew. Is he mad or what? He fires one of the revolvers and a man drops. A mutiny! a mutiny! I see the men rushing up like fanatics. They climb the wall, he shooting the while. Ha! he rushes into the citadel and closes the inner door sharply. They try to follow him but cannot!"—after a long pause—"stay, they have broken the door open, and rush—"

A flash that beggared the levin bolt, a crash shattering the window panes and deafening the ear, a shock hurling us both on our backs, broke the utterance. Then thundered down a shower of massive fragments, fragments of the vast ship whose decks I had once trodden. Hartmann, dismayed by the failure of his plans and rendered desperate by the letter, had blown up the *Attila*!

A Yorkshire Naturalist.

IN *Good Words* for September there is a pleasant written paper describing the life of the Rev. F. O. Morris. The following picture of the greeting between the rector and his birds is very pleasant. Mr. Morris used to get up in the morning somewhat late, but the moment he could leave his bedroom he went to feed the birds:—

He hurries out, breakfastless and in his shirt-sleeves. "Dicky! Dicky! Dicky!" his voice calls; not a strong voice, but a sweet one, able to read the psalms and lessons on Sundays in a way one seldom hears now.

Instantly there is a tumult, much chattering and screaming. There would appear to be a perfect shower of birds. From out the thick, nest-shading, sheltering yews, down from the strong, many-twigg'd elms, from the beeches and the birches, the birds come to greet the man who knows them so well, who knows them almost better than they know each other. Cannot he tell the names of those other countries, their winter homes?

From the little stand kept for the purpose the feathered friends are fed, while the naturalist speaks a word of welcome to one or other, or of advice or friendly counsel.

The birds look at their big father, turning their heads sideways to do so with many quaint bobs and caprices and pirouettes. Blackcaps, gold and green finches, wrens, perhaps even the rare hawfinch, who sometimes condescends, blackbirds with their yellow bills, thrushes, a whole museum of birds might have come to life and flocked to Nunburnholme. His favourite bird, the chaffinch; his favourite flower, the primrose.

And amid all the uproar and morning gossip, it may be scandal, the rector stands watching with a close quick eye for some bird notion he may not have yet noted; still in his shirt-sleeves, breakfastless, and with his great mane of soft silver tossed back from his brow.

THE DOOM OF THE MAN CLERK.

A LAMENT OF A CANADIAN MAN.

In the *Canadian Magazine* for the month of August Mr. J. L. Hayne publishes a very notable article entitled "The Displacement of Young Men." His view is that girls are so much more clever as clerks than men, that the male clerk is doomed to extinction like the dodo, and he thinks the results are most disastrous both to women and to men. The following are the salient passages of a paper which will be read with interest, and possibly with sympathy, by a good many men outside the Dominion of Canada:—

Nearly all classes of clerical work are passing rapidly into the hands of young women. These young women enter the offices with skilful fingers, winning manners, industrious ways, and general aptness to write letters, keep books, count cash, and discharge the multitudinous duties attaching to business life. They do their work satisfactorily and well. Taken altogether, they are neater, better behaved, and quicker than young men. Nor can it be said any longer that physical disabilities render them inferior to young men in clerical positions where endurance sometimes becomes a factor. Experience has clearly demonstrated that these young women can do whatever is required of them, and do it to the satisfaction of their employers. From observation, I should say that two young women now enter the departments at Ottawa and Washington to one young man. What is true of the Civil Service is unquestionably true of all branches of business where clerks are employed. Shops and offices are all but closed to young men, and each year the situation assumes a more fixed form. Into all the lighter branches of labour women are entering in steadily increasing numbers, to the exclusion of men. The result is, that these bright young fellows, capable of doing excellent work, are forced to toil for long hours, often at night, for the munificent salary of \$15 a month. After two or three years of hard and faithful service, promotion to the \$25 a month class is possible; while \$35 to \$50 is the outside figure to which a clerk may aspire if he exhibits special qualifications and sustained devotion to his task. If the next twenty years witness the same relative increase in the number of working girls and women as has taken place since 1870 in this country and the United States, we shall see young men doing the house work, and their sisters and mothers carrying on half the business of the land. As an instance of how the pinch is commencing already to be felt, I might cite the case of a family, consisting of two girls and a boy, all old enough to earn their living. The young man is a wide-awake, industrious and clever fellow; but, while his sisters are in good situations, he finds it impossible to secure an opening in which he could hope to make even the price of his board. This is by no means an exceptional case. Marriages are on the decrease in proportion to the population. Some months ago I took occasion, in writing for an American magazine, to prove by statistics two really grave facts:—First, that the proportion of marriages on the part of young men between the ages of twenty-three and thirty had materially declined during the past twenty years; and, second, that the number of unmarried persons, in relation to the total population, had very materially increased. I hold, after giving the matter careful thought, that the increasing number of working girls, and the falling off in the relative number of marriages, are connected in the relation of cause and effect.

Neither young men nor young women are content to live as did young men and women a generation ago—a thing which is natural and in most respects commendable, but it is only accomplished by the payment of a high price. A part of this price is, that the daughters shall earn their living as well as the sons, and that neither the daughters nor sons shall have the willingness to begin married life on a humble scale. I am honestly in doubt as to whether or not a remedy for this state of affairs can be successfully applied at the present time, or in the near future. Any means at all practicable would have to be educational in character, and should aim to simplify the general conditions of life. Take away this artificial basis

of social and domestic life, this imprudent and wasteful effort on the part of common people to live as if they were opulent, and by that one act you would return half the girls who now work to their homes. I say this because I believe that more than fifty per cent. of all the girls who now toil do not need to do so. Twenty-five years ago only one girl earned her living to ten who do so to-day. Will any one say that necessity has caused this great change? I think not. A very large proportion of the additional ninety per cent. have entered the field of toil in order that their parents may keep up appearances and they themselves enjoy many luxuries.

No girl should work who does not need to. If this rule were observed it would create an opening for at least two hundred young men in this city of Ottawa alone; for there are at least that number in the capital who have no other excuse for working than comes from considerations of cupidity, selfishness and pride. I know something of the circumstances of at least fifty girls who earn their living, and it is the simple truth to say that thirty of them should be at home.

Young women must realise these two things in chief: First, that in working, if they do not need to, they take the places properly belonging to young men; and secondly, that modern notions about the independence of women, coupled with extravagant ways of living, are partly responsible for the conditions which are bringing about a steadily declining marriage rate on the part of young men. In other words, when girls work they intensify the conditions which are filling this country with spinsters and bachelors.

THE ENGINE OF THE FUTURE.

A REVEREND gentleman, writing in the *American Journal of Politics*, publishes an interesting account of what he declares will be the locomotive engine of the future. This engine is the Raub gravity engine, which has been subjected to some very crucial trials on the New York, Lake Erie and Western Railway. Mr. Covert says:—

The leading principle underlying its construction may be thus described. It is an engine of 16 by 24-inch cylinders, 62-inch drivers, 62 tons of weight, 2 4-foot boilers with only 900 square feet of heating surface, which competed not only with a conceded average economical gain of 50 per cent. in tractive force against an Erie service engine of 20 by 24-inch cylinder, 5-foot boiler, and 2,000 square feet heating surface, but its system inferred all the requisite means to construct and operate a type of central power engines with a capacity to pull even 10 Pullman cars at an average speed of 75 miles an hour over an elevation of 50 miles and intermediate grades of 100 feet per mile without increasing the standard velocity of the pistons, nor the practicable diameter of her drivers of 6 feet. This momentous engine will henceforth be known as the Raub Gravity Engine, which, besides many other essentials, differs principally from the original central power engine by her introduction of three instead of two cylinders and a compound gliding and rotary flue boiler of 200 pounds standard steam.

Engineers, who naturally distrust parsons when they take to describing locomotive-engines, will attach much more importance to the following extract of the report of the engineer of the New York Central, who, after explaining what the Raub engine did, and how it outpulled and outworked the strongest engine they could put against it, sums up as follows:—

The inferences to be drawn from these trials and observations show clearly a gain in tractive force in favour of the Raub engine, ranging from 12.6 to 100 per cent. in comparison with any ordinary engine of her dimensions, a saving of fuel averaging 50 per cent. and a gain in freightage to 40 per cent., while her ability of speed admits now of sixty miles an hour with a train of 12,000-107, equal 100 tons, equal four Pullmans over grades of fifty feet per mile, and her three cylinder improvement infers a through speed of one hundred miles per hour with a train of seven Pullmans as the result of her doubled tractive force and momentous centrifugal power.

JOHN ADDINGTON SYMONDS.

A CHARACTER SKETCH BY THE HON. RODEN NOEL.

MR. RODEN NOEL, who was a great friend of John Addington Symonds, contributes to the *Gentleman's Magazine* for September an appreciative sketch of the fallen prophet of Neo-Paganism. Mr. Noel, who speaks of Mr. Symonds with a knowledge born of a long and intimate friendship, says:—

THE PROPHET OF NEO-PAGANISM.

His nature probably was not originally a devout one, and it had been thrown into violent reaction by the grim and dismal saturnalia of other-worldliness, in connection with which an ancient female relative in his childhood had oppressed, scourged, and fettered him—so he once told me; although from his father, the celebrated doctor, he derived much of his liberal culture and love of art, in addition to a good house at Clifton and a moderate fortune. But among the mountains, during the long solemn winters at those altitudes, in converse with the mountaineers, his character took on a new earnestness and depth, his thoughts width and profundity; yet he had always been a brave man, fighting strenuously with a fate which would have consigned some valetudinarian rich men to the degradation of enforced indolence and mere frivolity; but he fought a long life-battle with one of the most painful of diseases, and died in harness, having produced many books of high value in prose and verse; some of them monuments of industry and a treasury to the student, all of them alive and aglow with the spirit of poetry. Yet his nature, ever eager, swift, and bright, was immeasurably deepened, so it seemed to me, by those year-long communings with nature and simple, frank companions, fresh elemental persons in touch still with their mother earth, and the pure heavens, sun, moon, and stars.

A REACTION AGAINST PURITANISM.

Mr. Noel, in a dissertation concerning Neo-Paganism, tells us that:—

The Neo-Pagan movement is in fact a reaction against the sour and mischievous Puritan view of life, which pronounces pleasure, or certain arbitrarily reprobated pleasures as displeasing to a jealous God, who severely exacts personal worship from his subjects, and punishes the slightest deviation from his arbitrary laws with disproportionate penalties, who bids us treat this earth as a mere unreal and momentary ante-chamber, fraught with allusive illusions, in our passage to a real, never-ending state of existence beyond the grave.

HIS FAITH IN THE DIVINE.

But this reaction, although it carried Mr. Symonds a long way out, did not carry him as far as some people imagine. Mr. Noel says:—

The faith of Symonds, like that of Whitman, in the cosmic divine order is immense, their cosmic enthusiasm in their best moments exalted. My friend told me that when he sat by the white dead form of a beautiful one dearly loved, his faith was absolute that all was right with her as an integral element of the divine universe, though he could not see his way clearly to dogmatise about her individual and personal survival; that the divine, and permanent, and real in her survived he was certain. This no doubt was much the position of Spinoza. But I think the hope of Symonds for individual survival became more definite and distinct toward the end of his life. Even the sonnet sequence of "Animi Figura" shows that; certainly in Whitman, as I understand him, there was a strong and definite conviction to that effect. "My feet are tenon'd and mortis'd in granite." Probably this multiplication and fortifying of faculties is likely in part to occur through the development of what seems a sixth sense in connection with such phenomena as are dealt with by hypnotic experiments and psychical research; though in these Symonds was little interested. He had the utmost reverence for the character of our Lord, and even in the essay I speak of proposes His career as a criterion of conduct.

J. A. SYMONDS IN SWITZERLAND.

Of Mr. Symonds's characteristics, and of his habits in his Swiss exile, Mr. Noel tells us:—

Even when his friends paid him a short visit, he would spare them as little time for lounging, recreation, or conversation as the busiest professional man; but he made up for this by sitting up late conversing, one might almost have said carousing, for he drank freely of the country's excellent Sforzato and Sassella wines with his peasant friends, or with his friends from England, his conversation being brilliant and varied to a degree, ranging from subject to subject with ample and exact knowledge of each, the fruit of accurate, assiduous, and prolonged study. But now and again he would spare a day for an expedition of pleasure with his guests, and as a host he catered admirably for their amusement. He was an excellent Latin and Greek scholar, besides knowing Italian literature intimately, with sufficient proficiency too in French and German. In many arts he was (of their theory at least) master, which rendered his criticism of painting, sculpture, and other arts always intelligent and worthy of respect. He had his faculties at his fingers' ends, and did not labour for expression, which made composition probably easier to him than to many others. But with all his head-work (and he transacted besides much business of a practical kind) he was also, as I have said, intensely emotional; his friendships were numerous, and frequently ardent, which necessarily caused inward conflict, when the ideals established, and conventionally respected in the community of which he was a worthy and honoured citizen, seemed to clash with the impulse that was free, pleasure-loving, and pagan. Now, such a life proved necessarily an exhausting one to a man of precarious health, who was often prostrate for weeks with terrible lung-inflammation attacks, one of which ultimately carried him off. His was, I think, one of the bravest lives ever lived.

WHAT NEO-PAGANISM LACKS.

Before closing the article, Mr. Noel feels compelled to put on record his reasons for refusing to become a Neo-Pagan himself. He says:—

To me Neo-Paganism, though I am in strong sympathy with its revolt in favour of reason, emancipation of conscience, and recognition of the essential dignity of the body, appears to leave out in its reaction elements peculiar to Christianity, so important to human life that they have given a distinctive character to modern civilisation—the significance of sorrow and suffering as educational, and the triumphant claim put in for the lowest and narrowest, the most degraded and despised, among mankind, that they are all equally children of God with the highest, most aristocratic, clever, or religious of the race; nay, that they are, in some sense, even especially blessed. We need faith in the immanent God, who is indeed our very selves, eliminating by transforming the evil, educating, developing, conforming us to the Ideal. But the self-emptying, crucified human God is an integral factor in this idea. Nor could Whitman have seen an aureole around the heads of average, or even degraded men and women, if the aureole had not first been seen around the head of Christ.

In the *Catholic World* for August, an article under the title of "The A.P.A. Conspirators," by the Rev. T. J. Jenkins, gives some account of the methods and aims of the Anti-Catholic propagandists, who took oaths to denounce the Pope, his priests and missionaries, and the diabolical work in the Roman Church.

THERE is a character sketch in *Temple Bar* of the Comte de Paris. It is, however, less interesting than another article by Mr. E. H. Barker, entitled "A Night with the Trappists." Mr. Frederick Dixon tells once more the dismal story of the destruction of the British army at Cabul in 1841. "The Vision of Augustin Nypbo" is a story that might have been suggested, if it were not, by some recent articles on Psychometry.

WOE! WOE! WOE!

JEREMIAH ON THE STOCK EXCHANGE.

MR. A. J. WILSON, in the August number of the *Investors' Review*, does and overdoes his accustomed rôle of Jeremiah. Mr. Wilson is far and away the most brilliant writer on financial matters on the press, but never was there a financial journalist yet who took so sombre a view of—well, of everything. At present, no doubt, he has cause for chortling in his joy over the disaster which has overwhelmed the Australian banks, and the persistent financial *malaise* in the City. Mr. Wilson is so sure of his facts and of his inferences from his facts that he thus retorts upon critics who have mildly suggested that he was a pessimist:—

THE SCREAMING BABOONS OF THE PRESS.

These shouters of the words "pessimism," "pessimist," remind us of nothing so much as the forest apes who rain cocoa-nuts down on whoever dares to intrude on their haunts, on whatever comes beneath their trees which is new and strange. Facts are strange and horrific things to the hidebound, the limp and idealise mind which this luxurious age appears to have bred. It resents their intrusion upon the false peace of their stupidity, and "pessimism," "pessimist" are their cocoa-nuts. When they have thrown these at the quiet inquirer's head they imagine him crushed. The screaming baboon of the jungle is not more an imbecile than they. Readers of this magazine will be wise in paying no heed to these jabberers.

PEACE! PEACE! WHEN THERE IS NO PEACE.

Mr. Wilson outdoes himself in denouncing those prophets who daub with distempered mortar, crying "Peace! peace! when there is no peace." His description of how things stand is very gloomy:—

All credit is on the strain, the pinch of losses grows harder every day, examples of bad faith and fraud—brutal, unblushing fraud—multiply almost hourly. Nothing is sure just now, except that the prices of almost all public securities are above their intrinsic values, and that nowhere have losses been manfully faced and acknowledged. The markets float on bladders inflated with the breath of liars, and agitation, and sorrow, and loss are with us until these bladders are pricked and the bad air let out. Then, when solid ground has been reached, we may begin to have confidence, and to build anew.

LYING AND THIEVING IN EXCELSIS!

For the City, he tells us, is given over to a saturnalia of liars and thieves:—

Banks and finance houses indulge in a universal system of simulation, nothing is faced out and sternly probed to the bottom. The attitude of City finance houses towards the public has become, these years back, entirely vicious and destructive of confidence. All save the very highest kinds of securities have been looked upon as instruments for plundering. One dire result of this culture of deception and fraud is that the stock markets are burdened with incalculable masses of securities which represent no real values, which are mere products of the thief's ingenuity. Thus have lying and corruption bred rottenness, and until the rottenness is cleared away, until the City makes up its mind to adopt honest ways of doing business, we must expect to have a "crisis" with us *en permanence*. What the investor has to fear is bolstered securities. He ought not to buy for investment any American railroad share, any Argentine Government security, any shares of whatever quality on which there is a liability.

The practice of thieving and lying indulged in at the heart of the Empire bears evil fruit elsewhere, and Mr. Wilson has a very powerful article denouncing Sir William Harcourt's Budget speech, in which he declares that the Empire itself is not very far from bankruptcy!

PREACHING ECONOMY.

Extravagance and waste are everywhere dangerous, and if persisted in with us they will end in making this splendid

empire a thing on which the sun never rises. We may have as a nation to take upon ourselves part of the burden of India to save it from decay and bankruptcy; the danger of loss from defaulting borrowers faces us at all points. Riches so precariously founded preach economy in the State with a voice of thunder. Put the matter in another light. Our own national debt of £700,000,000 odd may be looked upon as a first mortgage upon the empire. Next to it stands the local debts, and the debts and guarantees of our railways. They foot up, these mortgages, to more than another £1,000,000,000; and below them again come the unascertainable sums we have put out in countries not under the British flag. They are at least £500,000,000, so that we have about three thousand millions sterling out on mortgage, of which two-thirds or so is upon the empire itself. This is exclusive of the immense sums embarked in private adventures at abroad or at home, in the form of share capital or in other "unsecured" investments.

WHAT SHOULD BE DONE THEN?

Mr. Wilson has little to tell us beyond the fact that we should pay off our debt quicker, reduce our expenditure, and get rid of all State factories. He says:—

I recommend the Chancellor of the Exchequer to turn his attention towards these all-devouring fighting services of ours, and to study how to arrange for the gradual abolition of State-sustained, tax-devouring factories of all descriptions. If economy is practised this empire will probably last out the youngest of us at the worst, and may last a century or two in a fashion. But what most certainly cannot long continue to endure is a concurrence of empire with administrative extravagance and a thoughtless up-piling of debts. This huge empire will only in the true sense become wealthy in proportion as it is taken out of pawn, when the capitalist co-operates with the worker in production, instead of standing towards him as a task-master towards his bondsman. What a change this co-operation might yet create all over the waste surface of the land! But this is a day dream.

INDIA AND THE SILVER QUESTION.

Mr. Wilson deals with the recent action of the Indian Government under the characteristic title, "An Indian Lunacy." He says:—

So the Government of India has nailed up its weathercock. Henceforth, blow the wind whence it may and ever so fiercely, it will always be constant and fair around the treasuries of the dusky empire. We stand dismayed. Can it be indeed true that whom the gods wish to destroy they first make mad?

The consequence, therefore, of this attempt to force silver up in price artificially within India must be a surreptitious import of the coins, and of bars, which will have the effect of undermining the stability of Indian finance perhaps more rapidly even than the Government's own wastefulness. Already, we understand, the demand for the uncoined metal has become active in the bazaars all over India. There it will be exchanged by weight, in the ancient Eastern manner, when not coined, and a new instrument of extortion is thus put into the hands of the Hindoo banker.

BENEFICENT BANKRUPTCY.

We should be in no way surprised were the Government of India compelled to retrace its steps before many months are past, and driven to beg the Home Government to come to its assistance, either by taking over a portion of its liabilities or by directly guaranteeing a large emergency loan. Some consummation of this kind is, perhaps, the best that could happen, because thus alone does it seem possible to arouse the people of England to examine into Indian affairs. Brought face to face with a financial catastrophe which would shake the credit of the Empire to its foundation, there might be a chance of reform. There is now none. The critic is as one beating the air; the fools can only hurl their cocoa-nuts at his head. Ungrateful though the task be, it is none the less necessary to insist once more that the true curse of India is, not cheap silver, not a falling exchange, but debt and extravagance.

HOW THE WORLD WILL END.

AN ASTRONOMER'S PREDICTION.

M. FLAMMARION, in the August number of the *Cosmopolitan*, concludes his story concerning the end of the world. It is very interesting, for he not only ends the world, but he ends also the sun and all the planets. After describing how the world gradually became a level plain, he says:—

The last habitable regions of the globe were two wide valleys near the equator, the basins of dried up seas; valleys of slight depth, for the general level was almost absolutely uniform. No mountain peaks, ravines or wild gorges, not a single wooded valley or precipice was to be seen; the world was one vast plain, from which rivers and seas had gradually disappeared.

THE LAST DAYS.

Life in these two last inhabited regions is prolonged with great difficulty:—

These two ocean valleys, one of which was near the bottom of what is now the Pacific Ocean, the other to the south of the present island of Ceylon, had formerly been the sites of two immense cities of glass—iron and glass having been, for a long time, the materials chiefly employed in building construction. They resembled vast winter-gardens, without upper storeys, with transparent ceilings of immense height. Here were to be found the last plants, except those cultivated in the subterranean galleries leading to rivers flowing underground. For thousands of years the genius of man had been almost exclusively applied to the struggle with destiny. The last remaining water had been forced to circulate in subterranean canals, where also the solar heat had been stored. The last animals had been trained to serve these machines, and the nutritious properties of the last plants had been utilised to the utmost. Men had finally succeeded in living upon almost nothing, so far as quantity was concerned; every newly discovered form of food being completely assimilable. Cities had finally been built of glass, open to the sun, to which was conveyed every substance necessary to the synthesis of the food which replaced the products of nature.

THE LAST OF THE MORTALS.

M. Flammarion carries the story on until there were only two people left alive in the whole world: a man in one valley, and a woman in another. Finding all dead but themselves, they mount their air ships, and sail over this silent and uninhabited world. They descend near the Sphinx, and here they die, their souls rising to Jupiter, where all the good mortals seem to have a new lease of life. M. Flammarion then gives wing to his fancy, and describes how in process of time all the great planets will go out, and the sun will become cold and dead.

THE END BUT A NEW BEGINNING.

The end of this astronomer's picture of the future of the universe is as follows:—

Long after the death of the earth, of the giant planets and the central luminary, while our old and darkened sun was still speeding through boundless space with its dead worlds on which terrestrial and planetary life had once engaged in the futile struggle for daily existence, another extinct sun, issuing from the depths of infinity, collided obliquely with it and brought it to rest!

Then in the vast night of space, from the shock of these two mighty bodies was suddenly kindled a stupendous conflagration, and an immense gaseous nebula was formed, which trembled for an instant like a flaring flame, and then sped on into regions unknown. Its temperature was several million degrees. All which here below had been earth, water, air, minerals, plants, atoms; all which had constituted man, his flesh, his palpitating heart, his flashing eye, his armed hand, his thinking brain, his entrancing beauty; the victor and the

vanquished, the executioner and his victim, and those inferior souls still wearing the fetters of matter,—all were changed into fire. And so with the worlds of Mars, Venus, Jupiter, Saturn, and the rest. It was the resurrection of visible nature. But those superior souls which had acquired immortality continued to live for ever in the hierarchy of the invisible psychic universe. The conscious existence of mankind had attained an ideal state. Mankind had passed by transmigration through the worlds to a new life with God, and, freed from the burdens of matter, soared with an endless progress in eternal light.

The immense gaseous nebula, which absorbed all former worlds, thus transformed into vapour, began to turn upon itself. And in the zones of condensation of this primordial star-mist, new worlds were born, as heretofore the earth was.

So another universe began . . . These universes passed away in their turn. But infinite space remained, peopled with worlds, and stars, and souls, and suns; and time went on for ever.

For there can be neither end nor beginning.

The Training of Wild Beasts.

MR. RAYMOND BLATHWAYT, in *McClure's Magazine* for July and August, continues the narrative of his experiences and interviews with Hagenbeck, the master of modern menageries. The article is full of interesting facts, and concludes with a vivid description of the training of the animals for the World's Fair at Chicago. Mr. Blathwayt's account of the mastery which Hagenbeck has secured over lions, tigers, and all manner of fierce carnivores by petting and affection is very striking, and would have filled with delight the advocates of moral suasion, whose theories Artemus Ward ridicules so unmercifully. Mr. Blathwayt says that in 1870 one caravan, which took thirty-six days in travelling from Kassala to Suakin, included fourteen giraffes, five elephants, a rhinoceros, four buffaloes, six lions, five leopards, thirty hyenas, sixteen antelopes, twenty-six ostriches and forty-five monkeys, besides other animals. They needed one hundred and twenty camels to carry food and water, and one hundred goats to provide milk and meat. The young elephants were fed chiefly on a kind of cherry, and the larger animals were kept going by perpetual relays of ship biscuits. After they get on board ship many of them die; elephants suffer fearfully from sea-sickness, and cannot eat. On one occasion out of forty shipped in Africa, only twelve arrived alive at Hamburg. Ostriches on board ship have a habit of breaking their legs in a storm; on one occasion out of forty-two, thirty-two perished on the voyage. Several times Mr. Hagenbeck has had to pursue escaped wild animals through the streets of crowded cities, but so far, he seems to have escaped any serious accident. In training the animals they find music a great help; tigers are taught to ride tricycles, lions to drive chariots and ride on ponies, but the crowning triumph of Mr. Hagenbeck was when he caused a Roman chariot to be drawn round the arena by a brace of huge tigers, while a lion with a crown on his head and a royal crimson robe on stood in the chariot; the reins were passed round his shoulders, and two boarhounds walked in the rear of the chariot on their hind legs as footmen.

THERE is as much miscellaneous interesting reading as ever in *Great Thoughts* for September. *Inter alia*, it contains interviews by Mr. Raymond Blathwayt with Mr. David Anderson, the teacher of journalism, and Dr. Dallinger, on science and religion; a continuation of the editor's articles on "The Greater Poets: with Echoes from their Music;" and a sketch of "The Life and Teaching of Robert Owen, the Father of English Socialism," by the Rev. S. E. Keeble.

BJÖRNSTJERNE BJÖRNSSON.

AN INTERVIEW WITH THE NORWEGIAN NOVELIST.

MR. HJALMAR H. BOYESSEN publishes, in the *Cosmopolitan* for August, a very interesting and well-illustrated article describing his interview with Mr. Björnsterne Björnsson. From the report of his conversation I will only quote two passages.

THE TRUE TEST OF PROGRESS.

Speaking of the true test of the civilisation and progress of the country, he says:—

Civilisation must be judged, not by the splendour of your othschields, your Vanderbilts, and your Astors, but by the average intelligence, comfort, and well-being of the great people itself, in field, in mine, and in factory. The progress of civilisation is to be gauged by the admission of an ever larger and larger proportion of the population to that degree of prosperity which will enable them to live decent, laborious, but yet comfortable lives, and not be crushed into mere soulless machines of toil. I am so constituted that I must sympathise with the under dog. It is the many who toil and starve and suffer whose lot I have at heart; it is the poor, the small, who cannot rise and assert their rights—it is these I love; and I believe that that country is the strongest, the greatest and the most civilised which is covered with millions of modest but contented homes; not that in which the splendour of a few hundred palaces is supported by the wretchedness of a million hovels.

THE AMERICAN WOMAN.

The other extract deals with a different and more delicate subject, namely, the beauty and wisdom of American ladies. Mr. Boyesen says:—

"I have heard it a hundred times that the American ladies were so wonderful. Truth to tell, I really believed it. I came with great expectations. But now, do tell me, what they have in advance of Norwegian women, for instance, except that they are better off, and consequently dress better?"

"They are, as a rule, far more beautiful," said I.

"Beautiful? Well, now, what constitutes beauty? They have soft skin, well-cared-for persons, good clothes. But the soul, the soul, my boy, that gazes out through this transparent covering, is vain, flimsy, self-conscious, and filled with a thousand petty frivolities. Mere regularity of features counts for little with me, if there is no nobility of soul that shimmers through. The American women I have met have, with few exceptions, been of this type. They demand much of life, but they have no idea that life has the same right to demand something of them. They are clever—with a sort of flimsy, superficial cleverness, and they know how to assert themselves and get the most out of their husbands and fathers. But they have been woefully spoiled. They never can get away from their own dear, little, pretty selves; they cannot lose themselves in a great thought, a great idea, and learn the blessedness of living for something better than vanity and flirtation and social tittle-tattle."

"You have, indeed, been unfortunate in your acquaintance with American ladies," I observed, "but you are too hasty in your judgment. The kind of women you describe exists, indeed, here as elsewhere; but I contend that they are not typical of American womanhood."

"Well, I was long disposed to make that admission, but a few weeks ago I attended a Woman's Rights convention, and felt confident that here I should at last find women who had emancipated themselves from the paltry frivolities of their sex. But there too, though there was some good speaking, there was much the same rivalry in dress and much vain display."

"YES, LET HER COME TO US!"

Mr. Boyesen mentions the authority of a friend and neighbour of the poet, that Mr. Björnsson is very good in his personal helpfulness of women who have fallen under the heavy cross which is laid upon the shoulders of women who stray from the straight and narrow path:—

"Björnsson," he said, "is the most large-hearted and unprejudiced man I have ever known. He maintains, truly enough, that there is a monstrous injustice in the penalty which women incur by the same offence which is so readily pardoned in a man. When Björnsson hears of a case where some unfortunate girl has been placed in a compromising position—when a helping hand might perhaps save her from social ruin and restore her to usefulness and self-respect—he says to his wife: 'Caroline, can we not do something for her? Can she not stay with us till we can find her something better to do?' And his wife, who nobly seconds him in this courageous charity, will answer: 'Yes, let her come to us.' Then she writes a letter to the girl in question, and you may imagine how joyously her invitation is accepted. Björnsson then, through his many connexions, exerts himself to restore the girl to her place in society—to straighten, if possible, the tangled skein, or, perhaps, open to her some suitable activity in the Scandinavian settlements in the United States. And to the honour of his neighbours and countrymen be it said, that he exposes himself to no scandalous gossip by such action. For Björnsson's character is so well known, through and through, that even his enemies, who in political controversy will leave him no shred of honour, have too much decency to assail him from that side. He is—he is—well, he is—in that regard, what Aristides was to the Athenians."

The Re-Discovery of the Upper Thames.

A WRITER in *Cornhill Magazine* for September, under the title of "A New River," calls attention to the advantages offered by the Thames above Oxford for the pilgrim for solitude. After stating that the lower Thames is crowded, he continues thus:—

"Oh, for a new river"! is the universal cry. Well, if we only knew it, we have a new river as silent, as secluded, to all intents and purposes, as a South American forest stream, or a Californian creek. People do not always know or appreciate what lies nearest to them; and this "new river" is at an easy distance, for the jaded Londoner can reach it in only one hour-and-a-half from Paddington. An hour-and-a-quarter's train, and then ten minutes' drive, will land you in Port Meadow, Oxford, on the shores of the "Upper River," as the undergraduates call it.

At first, for a mile or two, the pilgrim will find the Thames not unencumbered by picnickers.

An hour or two's further rowing will land you in undreamed-of solitudes, such as would have satisfied St. Jerome and St. Francis themselves, and certainly such as in your wildest aspirations you never dared to hope for. The hum of the city fades from your memory; in an incredibly short time you seem entirely to belong to your new surroundings, to live the life of nature.

The Missionaries of the World.

THE *Church Missionary Intelligencer* for September publishes a letter from Bishop Tucker, written just after the arrival of Sir Gerald Portal at Uganda. The number is also remarkable inasmuch as it contains the missionary statistics of Dean Vahl of the Danish Missionary Society. Outside Europe and the United States £230,000 a year is contributed for Protestant missions to the heathen. With this sum over 700 missionaries are supported. Dean Vahl makes out that, in 1891, two and three-quarter millions was raised for Protestant missions by societies and agencies which have now 5,000 missionaries in the field, and 2,445 female missionaries. The native communicants altogether amount to 1,168,000. Great Britain contributes £1,400,000; the United States £787,000. The largest sum contributed by any other nation comes from Germany, which supplies £129,000. The statistics should be supplemented by others showing how much is subscribed for Catholic missions.

BEETHOVEN'S WOMEN.

Westermann for September publishes an interesting article by Herr A. C. Kalischer entitled "Beethoven's Circle of Women." The writer, however, deals only with the two famous singers who may be said to have imparted the living soul to the master's great creations—Karoline Unger and Henriette Sontag, the first vocalists honoured with the solo parts in the final movement of the Choral Symphony and in the sublime *Missa Solennis* in D, when these works were produced at Vienna in May, 1824.

THE TWO BEAUTIES.

Beethoven's conversation-books, which record the conversations conducted in writing between the deaf composer and his friends, and which are now in the possession of the Imperial Library at Berlin, contain abundant references to the days of rehearsal at Vienna and the visits of the "Two Beauties" to Beethoven's house, and show us the deep and earnest master from his most amiable and genial side. In a letter to his brother, dated September 8, 1822, Beethoven refers to his two new friends:—

Two singers visited us to-day, and as they would kiss my hands, and were both pretty, I offered them my mouth.

At all events, a charming and original intercourse was begun about this time, and the conversation-books of 1823 and 1824 give many interesting details in connection with this friendship and the works on which the master was at that time engaged.

KAROLINE UNGER.

Karoline Unger, the elder of the two friends, was born at Vienna in 1800. Music and art formed the bread of life in her parental home and in the home of her god-mother, Karoline Pichler, and it was small wonder that the child's musical gifts were developed to good purpose in such a favourable atmosphere. Her training was undertaken by Aloysia Lange, Mozart's sister-in-law, Vogl, Schubert's best friend and interpreter, and Ronconi of Milan; and she is variously said to have made her *début* at Vienna in 1819 in Mozart's "Figaro," and, in 1821, in Mozart's "Cosi fan tutte."

HENRIETTE SONTAG.

The date of Henriette Sontag's birth at Coblenz is given as May 13, 1805, and January 3, 1806. She made her *début* at the age of five at Darmstadt, as Salome in Kauer's magic opera, "Das Donauweibchen." She was trained at the Conservatorium at Prague, and made her second *début* with success at the age of fifteen at Prague, as Benjamin in Boieldieu's "John of Paris." In her duet with Eduard Genast (Jakob vom Stapel) in the third act, she was received with great applause; the duet had to be repeated, and the singers were recalled several times. Indeed, Henriette Sontag at once charmed Germany and all Europe by her voice and her beauty. Later, she went to Vienna, and there formed a friendship with Karoline Unger.

BEETHOVEN THE TYRANT.

At the time when Beethoven was about to give to the world his two great works, his intercourse with the two girls was already of a warm and intimate nature. Henriette, who was but eighteen, was destined to be the soprano, and Karoline, she was some six years older, was to take the contralto part. The first rehearsals with the two soloists took place in Beethoven's house, and it soon became evident that neither of the singers was finding the work as easy as was anticipated. They objected to the tempo of the Mass, and desired alterations in the

symphony, Karoline complaining bitterly of a certain high note. But the master could not be induced to yield to their demands, and the singers' enthusiasm was considerably damped for a time, Karoline going so far as to call the composer the tyrant of the vocal organs. Still, as the day of production drew nigh, Henriette's courage increased, but it was otherwise with Karoline. Nevertheless the performance was a triumph, and the heart and enthusiasm of the audience went out to the composer, who stood by the conductor and fixed the tempo for each movement. But the deaf master knew nothing of the applause and enthusiasm which greeted his efforts till Karoline had the happy thought to persuade him to look round and face the people. He bowed his thanks, and then saw that this was but the signal for a still wilder outburst.

LATTER DAYS.

There is no adequate biographical picture of Henriette Sontag, but Goethe was greatly fascinated by her, and addressed several poems to her. She was married to Count Rossi, and died of yellow fever or cholera in Mexico, June 17th, 1854. Karoline Unger became the wife of M. Sabatier of Florence, and died at Florence, March 23rd, 1877, at the age of seventy-seven. Writing in 1873 of the Beethoven days at Vienna, Karoline refers to Beethoven's room as a church to Henriette and herself, and as such they entered it. They made many attempts to sing something for him, but their efforts were futile, for the master was then quite deaf. Karoline still remembered her hasty remark about the high note, and Beethoven's reply: "Learn away, and the note will soon come." It certainly did not fail her on the day of performance; and henceforth Beethoven's words always rang in her ears and spurred her on to fresh endeavour. She had only one letter from the master, and that, together with a letter from Mozart, was stolen from her. Fanny Lewald-Stahr, in her book, "Twelve Portraits from Life" (Berlin, 1888), gives a charming picture of Karoline Unger, but in the Beethoven-Album only the signature of Henriette Sontag appears, and Karoline Unger is not represented.

Music in Dahomey.

ANOTHER interesting article on a musical subject appears in the *Revue Encyclopédique* of August 15. M. Julien Tiersot here discourses on "The Music of Dahomey," not from personal experience in Dahomey, but from a study of the various troupes of Dahomeyans and Amazons that have visited Paris time and again and have given musical performances, and his paper forms a valuable contribution to a general study of musical ethnography.

As was to be expected, the music of Dahomey is of a military and warlike character. At the festivals groups of young women execute extraordinary dances, with vocal and instrumental accompaniment. Most of the instruments belong to the kettledrum family; and indeed nearly all the instruments used are instruments of percussion, so that noise and tumult may be said to be the chief characteristics of the music of Dahomey. Besides, different players often render different rhythms at the same time, and the tumult may be better imagined than described. Sometimes, however, the men and women sing alternately, and then together, but the melodies seem very monotonous, and cannot be considered as art. Again, the voice of a chief will be heard alone, and be answered by all the chorus.

A LADY GEOLOGIST.

MISS MARIA M. OGILVIE, D.Sc.

THE University of London has now enrolled on its list of graduates a large number of women, many of whom have taken high rank in literature and science. Not a few, some of them well known in scientific literature, have obtained the degree of Bachelor of Science; but women Doctors of Science have hitherto been extremely scarce. Only two names have till now appeared in the lists: those of Sophia Bryant (1884) and Charlotte Angas Scott (1885). This year for the first time the doctor's degree has been taken by a woman, Miss Maria M. Ogilvie, in the department of "Natural Science."

As Miss Ogilvie's career has been one of exceptional distinction, and as she gives promise of taking a prominent place amongst geologists, a short sketch of her life and work may be of interest to some of our readers.

Miss Ogilvie comes of a family which has a high reputation in the scholastic life of Scotland.

HER SCHOLASTIC CAREER.

In October, 1873, when eight years of age, she entered the Ladies' College, Edinburgh, and when under twelve years of age she gained a foundation of the value of £300 in a competition open to three Merchant Company Schools. This was the beginning of a series of brilliant successes, including the winning of a gold medal and a £100 scholarship.

MUSIC AND POETRY.

In her earlier years her chief interest centred in music, which she studied for a number of years at school under Dr. A. C. Mackenzie, now principal of the Royal Academy of Music. Occasional studies in Physics, Chemistry, Botany, and Physiology developed a new interest, and Miss Ogilvie resolved, in 1888, to go through a systematic course of training for the requirements of the Science Degree of the London University. She passed the Intermediate Science Examination of London University in July, 1889, and then entered as a student at University College, London, under Professor Ray Lankester (Zoology), Professor Bonny (Geology), and Professor Olivér (Botany). She gained there the gold medal in Professor Lankester's advanced class in Zoology and Comparative Anatomy, and passed the final B.Sc. examination of London University in October, 1890.

HOW SHE BEGAN AS A GEOLOGIST.

In the beginning of the following year Miss Ogilvie went to Germany for the purpose of continuing her studies in Zoology and Palæontology. But it is avowedly against the rules of most German universities to admit women students, and Miss Ogilvie was unsuccessful in

her endeavour to obtain access to the classes and laboratories in the University of Berlin. A few months elapsed before she was enabled to begin work in Munich University, under Professor von Zittel and Professor Hertwig. Every encouragement was there given to her by these professors. During the summer frequent excursions were made into the Bavarian Tyrol with the geological classes under Professor von Zittel and Dr. Rothpletz.

As the immediate result of these excursions, Miss Ogilvie, who had in former years been a keen mountaineer in the northern highlands of Scotland, gave up other studies in favour of field-geology in the Alps. In carrying out her wish to do some original work Miss Ogilvie found a kind adviser in Baron Richthofen, Professor of Geography at Berlin University, who suggested to her as a suitable subject of research the district of St. Cassian in South Tyrol. This has long been classic ground for the geologist; but considerable doubts had from time to time been expressed with regard to the theory that the Dolomites owe their origin to reef-building corals of Triassic age. It was known that the collections of St. Cassian fossils scattered throughout the museums of Europe were insufficiently labelled, having been obtained in great part by uneducated collectors in the district. The fossils from the slipped *débris*, with which the enormous landslips of that district have covered the hill-sides, were thus mixed with fossils from undisturbed beds, and specimens from different localities and from various horizons were thrown together under the general name of "St. Cassian Fossils."

HER WORK AMONG THE DOLOMITES.

Miss Ogilvie therefore began by subjecting the fossiliferous St. Cassian beds to a detailed investigation, collecting fossils from beds actually in position, and from well-known localities. At the same time she mastered the difficulties of geological surveying, and traced out in detail the outcrops of the St. Cassian beds, Schlern Dolomite, etc., over a large area. During her second summer of field work Miss Ogilvie completed maps of three districts, and gave particular attention to the unusually involved relations of faulting and other disturbances affecting the district. The greater portion of her results have been embodied in a paper published in the Quarterly Journal of the Geological Society for February last, under the title of "Contributions to the Geology of the Wengen and St. Cassian Strata in Southern Tyrol." This paper, seventy-eight pages in length, is illustrated by four maps and numerous sections; but we understand that some further facts are to be added and the general aspects of the question discussed by Miss Ogilvie in a paper which will presently be contributed to a German journal. From the work already published it is clear that Miss Ogilvie does not accept the coral reef theory as an explanation of the peculiar features of the district, but regards all the rocks as normal sea-deposits which have subsequently undergone great movements and disturbance. A large number of new species of fossils were discovered by her in the neighbourhood of Cortina, in beds which she has called an Upper St. Cassian horizon.

The difficulties attending this work were very great, and one may well be surprised that they could be so completely surmounted by a woman. The imposing scenery of the Dolomites is well known to Alpine tourists, who, however, mostly content themselves with a general survey from the valley, and an occasional ascent of some noteworthy height. But a geologist must scale every summit, and must track out the various strata, some rising as precipitous walls, some forming gentler slopes

MISS OGILVIE.

and ledges, ascending to the nature and "lie" of the beds. Many of the summits range from eight thousand to nine thousand feet in height.

AS A PALÆONTOLOGIST.

This paper in the Geological Society's Journal served as Miss Ogilvie's "Thesis" for the doctor's degree at London University. It therefore satisfied the examiners, and every one who studies it must be struck by the great amount of work accomplished. When not engaged in field work, Miss Ogilvie had been carrying on a subject of palæontological research, given her at the beginning of her stay in Munich by Professor von Zittel. In the superb palæontological collection, over which this professor so worthily presides, there is a great mass of material still requiring detailed study. The Munich Museum is especially rich in fossils from the "Stramberg beds," an interesting group of rocks which link together the Jurassic and Cretaceous systems. Most of the fossils

IN PRAISE OF LONDON.

MR. GRANT ALLEN having called London a squalid village, and a Quarterly Reviewer having lifted up his heel against the architecture of the Metropolis, it is about time that some one had to say a good word about dear old dirty London, of which we were told last month by vestry officials that its inhabitants are so filthy that they cannot be trusted to have seats in their streets lest they should defile them with unmentionable moral and physical filth!

Sir Lepel Griffin, in the *Pall Mall Magazine* for September, defends London from her traducers, and declares that she is one of the most beautiful cities in the world. This passage is a fair sample of his paper:—

In the natural and inherent elements of beauty London is superior to Paris. In the first place, there is the noble and historical river, by the side of which the Seine is little better than a ditch. Secondly, there is the succession of glorious parks, the lungs of the great city, stretching from Whitehall

TRAFALGAR SQUARE AS IT MIGHT BE.

have been already worked, and monographs upon them have been issued at the expense of the Bavarian Government. But the corals and sponges still remain to be published. Miss Ogilvie's previous biological studies made her well able to undertake the corals, and she has spent, in intervals of her other work, much time and labour on this study. Her monograph is expected to be ready this year, the numerous plates and microscopical drawings in illustration of it being already completed.

Miss Ogilvie has just been appointed one of the lecturers to the London University Extension Classes, and will give lectures on the physical geography and geology of the Alps, with especial reference to the Dolomite region. At the last meeting of the British Association (Edinburgh, 1892) Miss Ogilvie gave an address on the "Landslips of the Tyrol," illustrated by maps and sections. Those who heard this address will have no doubt of her success as a lecturer.

to Kensington Palace, such as are possessed by no other city in Europe. What view is there in Paris so beautiful as that from the Buckingham Palace end of the artificial water in St. James's Park, looking towards the Foreign Office, or that from the bridge over the Serpentine? The Bois de Boulogne is altogether charming; but it is outside the city, and might be rather compared with Richmond Park than Hyde Park. The more notable buildings of London do not compare unfavourably with those of Paris. Westminster Abbey is more beautiful and interesting than Notre Dame, St. Paul's than the Panthéon; while, in spite of some grave defects and over-elaboration of detail there is no modern building in Europe which is superior in dignity, size, and beauty of position to the Houses of Parliament.

But Sir Lepel Griffin is not content with glorifying London as it is. He wishes to construct a new London, which will be even more gorgeous, and by way of beginning he proposes to transmogrify Trafalgar Square so as to resemble the picture which I am permitted to reproduce from the *Pall Mall Magazine*.

WOMEN AS JOURNALISTS.

MRS. EMILY CRAWFORD contributes to the *Contemporary Review* for September a paper on "Journalism as a Profession for Women," which she read at the Conference at Lucerne. Mrs. Crawford thinks well of women as journalists. She thinks that they write well, and have in a greater degree than men the faculty of throwing life into what emanates from their pen.

She then gossips pleasantly concerning various women journalists on the Continent, although she laments that journalism in Paris is well-nigh closed against women. This is partly due, she says, to the pest of gallantry, and to the narrow ideas of the wealthy and well-to-do classes about women's place in society.

Speaking of the qualifications required by women who wish to be journalists, she says:—

The first requirement then is health and a rich reserve of strength. I don't mean the strength of the railway porter, but the vitality which enables one to recoup rapidly after an exhausting bout of work. Women of good constitutions are more elastic in recovering than men. But elasticity is not enough. There must be staying power. It won't do to suffer from headaches, or to feel easily exhausted.

After health, Mrs. Crawford puts typewriting as the most desirable thing.

Learn typewriting. There is no better friend to the journalist and the eye-worn printer than the typewriter, which is invaluable to those who have few opportunities to correct their proofs. More typewriters and fewer pianos! The noise at first is distressing, but one gets used to it. Beside, working in noisy places is so often the lot of the journalist, that he or she must learn to be deaf to all that is not good to hear.

I have been asked by a mother from whom I had a letter, "What is the best preparation for a girl wishing to make a figure as a journalist?" Pulling down her conceit first of all. It is presumptuous in any novice to expect to make a figure at anything. Presently I hope to say something about the moral requirements of the profession, meanwhile I will glance at the educational ones. It is essential that habits of close observation and of punctuality in fulfilling engagements be formed. If the journalist has often to keep irregular hours, he must take care not to oblige others to keep them, and above all to be in time for the printers. An appetite for books is also to be cultivated. I have heard it said: "But life is not long enough for book-reading." It can never be too short for converse with those silent friends. The wider my range of life, the more pleasure and profit I take in books. They soothe, support and foster reflection, without which perception would be barren. Books deepen one's nature by strengthening the subjective part which is the mother of imagination and of emotion. There is no communicative power in a purely objective writer. Recollect that there were few great writers who were not in youth omnivorous readers. All the feminine classic writers certainly were, from Madame de Sévigné to George Eliot.

The great school for the journalist, man or woman, is life, and the great secret of success pegging away. Nothing that it concerns the world to know of should be rejected as common or unclear. The philosophy of what that voice said in the vision of Simon Peter has been overlooked. As there should be no weed for the botanist, no dirt for the chemist, so there should be nothing common nor unclear for the journalist. The woman journalist should not seek, any more than the man, to be on the crests of high waves, but to be ready for them, and, when caught up on them, to trust to their landing her on high ground. One sex is just as well adapted for these high crests as the other. Every virtue that becomes a man becomes a woman yet more. Presence of mind and courage may be needful qualities in the ups and downs of a press career.

It is impossible to emphasise too strongly the practical usefulness of cultivating the moral qualities—ethic feeling (which

should not be demonstrative) and moral sense to prolong into old age bodily and mental vigour. The address and knack which lighten labour are certainly to be sought after; and in youth the rein is to be given to the passion for perfect literary form. But moral strength is the life of life. Adaptability is an ever necessary quality for the journalist. The best way to acquire it is to become at all times a slave to duty, which in principle is immutable, but the application of which is continually varying.

WHY THE WORLD'S FAIR WAS CLOSED ON SUNDAYS.

MR. JOSEPH COOK, in *Our Day* for August, dances with ecstatic delight over the defeat of the Sunday opening at Chicago. He says:—

Sunday closing of the World's Fair, with the nearly certain prospect that this will be the permanent rule of the exhibition, was actually accomplished July 23. The National Commissioners of the Fair, July 12, declared by a vote of fifty-four to six that they had never repealed their previous decision in favour of Sunday closing, and that the local Directory had opened the Fair on Sundays without authority. The Board of Directors themselves, when thus reprimanded and when convinced by experience that Sunday attendance was too small to pay and that Sunday opening diminished the patronage of the Fair by respectable people on week days, resolved on July 13 by a vote of twenty-four to four to close the Fair on Sundays.

He points out that the significance of this decision is immensely increased by the fact that the Sunday openers had a fair field in which to try their specific. Nearly all the newspapers, at least one bishop, and vocal, local public opinion insisted angrily upon the opening of the Fair, and in order to make money the directors opened it only to find that the exhibitors would not exhibit, and, therefore, the public would not come. Full payment for one quarter of the show did not commend itself to the American working-man; therefore, finding it did not pay to keep it open, the directors shut it up, and Dr. Cook rightly insists upon the significance of the fact that even in Chicago, with all its foreign-born citizens, it is impossible to make a Sunday Fair pay.

The West is not as wild as some of its critics have supposed. This victory for the day of rest and worship is of far-reaching, strategic importance to high civilisation, at home and abroad. No more important triumph for Sunday has been achieved in modern history.

After this, perhaps it may be possible to get rid of the seven days' slavery which prevails in American newspaper offices.

MARLBOROUGH SCHOOL is described in an illustrated article in the *Ludgate Monthly*.

MESSRS. RAPHAEL TUCK AND SONS have sent me a handsome volume of coloured pictures designed to illustrate Tennyson's heroines. Accompanying the book they sent me particulars of some thirty-two prize competitions in which they propose to give away £2,500. These competitions are in two divisions—the first literary, for original composition in either prose or verse to one of the illustrations in a selected book, or for selection from appropriate quotations from the Scriptures or the poets. The second division, for painting, the prizes are offered for a copy of illustrations in colour or black and white. A special section is reserved for children, and certainly this firm deserve every credit for establishing a system which can hardly fail to develop the amateur among both young and old.

A PLEA FOR A SERVANTS' SUNDAY.

MRS. RUTH LAMB, in the *Sunday at Home* for September, puts in a much needed plea for a servants' Sunday. She is quite right in calling attention to the fact that Sunday feasting may be all very well for the feasters, but it tells very heavily upon the servants:—

The tendency of to-day, especially amongst the wealthiest classes, is to make Sunday the principal visiting day of the week. Parties of every description are now arranged to take place on that day, because the presence and aid of professional vocalists, reciters, musicians, in short, all whose business it is to amuse by the exercise of their gifts, can be more easily secured on Sunday than on any other during the week.

What the Upper Ten do on a large scale, will certainly be imitated by those next and next in the social rank. The custom of ignoring the Sabbath as a religious institution, and dedicating its hours to visiting and recreation only, is fast spreading.

To girls who have been brought up in quiet country homes by God-fearing parents the change must be a great trial. But there is a vast number who regard its privileges in a very different light. First and foremost it is their brief season of absolute freedom from restraint.

Both Christian girls and non-Christian alike resent the addition of extra work on Sunday, and the loss of their Sunday out is at present not compensated by a holiday on any other day of the week. Hence, it is not surprising that Mrs. Lamb should fall back upon the suggestion that our abigails would do well to form themselves into a trade union for the purpose of defending their scanty leisure. She says:—

One hears much of combinations of working men and women for the protection of their common interests, and sometimes of their demanding wages and privileges which it would be ruinous for employers to grant. But I think, were I a domestic servant, I should gladly join a servants' union, which should have for its object the preservation of the God-given, never-to-be-over-valued boon of the Sunday, from the encroachments of those who selfishly devote its hours to so-called pleasure, at the cost of seven days' work per week to all who serve them.

THE SONGS OF THE AMERICAN INDIANS.

THE August number of the *Music Review* publishes two papers on Indian Music read at the American Musical Congress. Miss A. C. Fletcher's paper is uncommonly interesting:—

The Indian generally sings out of doors, and the din that attends certain classes of songs makes it almost impossible for the untrained ear to catch the melody. A dozen men may be singing with all their vocal force, and half as many more beating the drum with might and main. Add to this the noise of many people, the barking of dogs, and the confusion of a camp, and one can fancy how troublesome it would be to understand all that music stands for to the Indian.

His emotional expression is in his music. Every pleasure is enhanced by melody, and there is no sorrow or dread that is not solaced by music. When his soul is moved he bursts into songs; when he would seek aid from the unseen mysterious forces of nature, he sends forth the messenger of song to find the god or "Power that Makes," and to draw from its infinite source to supply his own need The prayer is always a song or a chant, and the vision when it comes is of some form which signifies to him the approving presence of the "Power that Makes." These vision songs belong solely to the individual; no man ever sings another man's sacred song.

Other songs have the power to entice animals toward the

hunter; these mystery songs have been received in dreams or visions. The religious songs are not all mystery songs; there are tribal ceremonies, religious in character, with elaborate ritual and music very simple in structure. Game and gambling songs are numerous; children have their ditties, which they hand down to still younger generations; fireside tales are interspersed with songs; and many avocations pursued by men and women are lightened by musical cadences. The waltz has a fascination to most strangers, especially if given in costume, the personal decorations, the movements, and the loud singing combining to make a wild and savage scene which the red man has learnt to know is pleasing to his white neighbour.

The text of the love-songs of the Omahas is much more elaborate than that in any other class, and affords an interesting study of the development of the ballad. One class of love-songs is supplied with musical syllables instead of words, and they are sung by the youth as he stands on some vantage point overlooking the lodge of the girl he desires to win. The funeral song of the Omahas is sung by a number of young men, who beat the time by striking two short willow sticks together. In the expression of their sorrow for the dead, they insert a small willow branch through two incisions in the flesh of the left arm, and their blood drips from the leaves as they sing their beautiful major melody. The blood is in token of sympathy for the bereaved; the dead cannot see the ghastly sight. The song is for the departing spirit that it may enter with joy into the future state.

It will thus be seen that the Indian is more concerned with the response of the song to his own mood than with its effect upon his ear as a musical composition; his enjoyment is emotional rather than intellectual.

Mr. J. C. Fillmore's paper in the same review dealt with the Indian songs in their technical aspect, but his study is equally interesting, and is accompanied by many musical illustrations.

WOMAN IN SONG.

By MADAME NORDICA.

In the *Music Review* for August, which, by the way, is an excellent number, several papers read at the American Musical Congress are given. Madame Nordica takes "Woman in Song" as her theme:—

As woman has been the great guide of most musical minds, so has she been also the ennobling and the ennobled theme of the creators of musical works. . . . Queens of Song have guided the masters of music to the haven of triumphant fame.

The drama portrays human emotions; music pictures them and idealises them. The drama pays tribute to the mind; music kneels at the throne of the soul.

The actor and the artist have many advantages denied the singer. When Miss Ellen Terry plays Marguerite in "Faust," for instance, she takes her time in arranging for the jewel scene; whereas in singing the Marguerite of Gounod the time is limited. During one bar the jewel casket is to be discovered, and two bars are allowed to get the earrings in the ears. The singer must get to the mirror, at the same time performing the most difficult feats of vocalisation. The orchestra is waiting, and combining time, tune, the meaning of the music, the facial expressions and the gestures is vastly more trying and more exacting than the art of the dramatic artist.

Women are progressing day by day, and there are living to-day women composers of great originality—Miss Ellicott, Miss Smyth, Maud Valérie White, Augusta Holmes, Mlle. Chamade, Helen Hopekirk, and many more.

Among vocalists there are many names to be remembered with joy. Incidentally it may be mentioned here that the lyric artist receives greater remuneration than any other, and that the highest terms of remuneration ever granted to singers have been awarded to women.

HOW TO STOP RIVER POLLUTION.

MR. FRANK SPENCE, in the *Contemporary Review*, has a short but very sensible article on this subject, the gist of which is that it would be quite easy to prevent the pollution of rivers throughout the country if the Local Government Board would but deal with sewage effluents on the same principles with which the gaseous products of chemical works are dealt with under the Alkali Acts. He says:—

The only measures needful would be to insist that every outflow of waste liquid from sewage works should pass through an open conduit, accessible to the inspector at all hours of the day and night; and to give to the chief inspector under the Alkali Acts a few additional assistants. The administration might well be the same as under these Acts. The chief inspector is necessarily a practical chemist, and the sampling of air and that of water are quite in the same line of work. As it is, he is engaged daily in protecting the air from what may be called gaseous sewage; and, indeed, he has already under his ken two classes of liquid pollutions—namely, hydrochloric acid and the drainage from soda-waste heaps.

The liquid discharges are of such varied character that (as was done in the case of the Alkali Acts) tentative restrictions might be imposed in the first instance, and gradually increased as experience enabled the inspectors to point out to polluters in each case that they were not employing the "best practicable and available means" of purification. For example, it might be required at first merely that every effluent should be made permanently non-putrescent, the test of this being so simple that even a labourer at a sewage works could perform it. (A well-stoppered bottle, half filled with the effluent, then tightly closed and left in a light room at ordinary temperature, should, on being opened, give off no offensive odour, however long the liquor is kept.) What a gain to public health and comfort in all towns, villages, and residences alongside polluted rivers would be secured by this one simple, reasonable, and perfectly practicable requirement!

The present excellent results of the inspection of British chemical works have been achieved almost solely by moral pressure backed by the shadow of the law. It would in fact be a real kindness to local sanitary authorities everywhere to put their sewage treatment under supervision, as it would transform all of them who are mere rate-savers for popularity's sake into local administrators, proud that they had made their effluents colourless, colourless, and suitable for fish life.

Mr. Chamberlain and His Orchids.

THE *English Illustrated Magazine* for September has a copiously illustrated paper on Mr. Chamberlain's orchids. The writer says:—

Mr. Chamberlain began the culture and collection of orchids some sixteen years ago, about the time when he built for himself at Moor Green, amidst the prettiest scenery on the outskirts of Birmingham, the house (named in allusion to the family's London connections) which is now known to all newspaper readers as "Highbury." Mr. Chamberlain now has about 5,000 plants of all kinds, and from all parts of the orchid-producing world, and of course the number is being continually added to. They fill thirteen of the eighteen glass-houses ranged along the side of Mr. Chamberlain's handsome yet unpretentious residence.

The greater part of the Parliamentary vacation every year is spent by the Liberal Unionist leader at Highbury, and during the session he frequently passes Saturday to Monday there; when at Highbury almost every minute of his leisure is spent in the orchid-houses. Mr. Chamberlain has a fine library of orchid literature, and there can be little doubt but what the flower appeals to him as much from its scientific as its æsthetic aspect.

When Mr. and Mrs. Chamberlain are in London a box of the most beautiful blooms is sent every week for the decoration of their house in Princes' Gate. In addition, two flowers of the kinds best adapted to the buttonhole are sent every day, and

it is with one of these that the Liberal Unionist Leader generally makes his appearance in the House of Commons. Mr. Chamberlain has taken every means, on the other hand, of obtaining the full enjoyment of the orchids when he is at home. One can go in and out all the houses without once encountering the open air. The drawing-room opens on to a lofty conservatory, filled with the scent of many sweet-smelling flowers.

How Clark Russell Writes his Novels.

In the *English Illustrated* for September Mr. Raymond Blathway gives an interesting account of how Mr. Clark Russell is able to write the sea novels which have so much vogue. The article is for the most part an interview with Mr. Russell:—

Forced by rheumatism to keep much upon his sofa, he dictates all his novels, finding indeed that he can work better so than if he were to pen them with his own hand. "I close my eyes, I realise intensely the whole scene, I see it as in a magic-lantern, I can dramatise the whole thing." He never puts pen to paper till all is carefully planned and mapped out.

There is first a general plot of the story, the dates of which are most accurately thought out; then come the *dramatis personæ*, the name of the vessel, the number and names of the crew, the passengers, with their general characteristics lined out. "I generally choose some one I have observed with attention, who acts as a lay figure right through, and so I do not lose his personality."

And again, no *locale* is ever imaginary in Mr. Clark Russell's books. "Even in writing of the most minute island," he said to me, "I always have an Admiralty chart of that island at my side so that I may be exact in my bearings and soundings."

Then the ship itself; it is not only exactly described—its tonnage, its cargo, its berthing, but there are numerous sketches of it which place it before Mr. Russell's eyes exactly as he imagines it, and so he is enabled to pace the deck, to go below, to dine with the captain aft, to go forward to the men's mess, almost as though he were actually on board the ship itself. There are in addition references to well-known books of travel in which well-authenticated incidents are recorded, to official journals, to anything in fact that may be of use to him in the writing of what many an untravelled critic regards as an impossible occurrence, and which nevertheless has actually taken place.

Mrs. Oliphant.

THERE is a character sketch of Mrs. Oliphant in the *Young Woman*, contributed by the Rev. J. W. Dawson. He says:—

Mrs. Oliphant has been among the hardest literary workers of our time, and her industry is nothing less than amazing. To produce some sixty books in forty-four years is a wonderful record, especially when we recollect the evenness of quality which characterises them. She has lately exchanged Windsor for the Riviera, but such a retirement to sunnier skies by no means indicates a retirement from the arena of her prolonged activities. At sixty-five her hand has not lost its cunning, nor do her later stories evince any lessening of literary power.

If one cannot point to any single book of hers as a book to be ranked with the great achievements of Thackeray or Meredith or George Eliot, one can point to the long series and say with confidence that each is alike good. And the list numbers nearer fifty than forty, to take no count of a dozen other books of history, biography, and criticism.

Now, what is the secret of this prolonged literary success? Its chief element is that Mrs. Oliphant has recognised her own limitations, and has worked within them with a steadiness of industry which is in itself phenomenal. She has taken for her field humble, commonplace and middle-class life, but has so treated the commonplace that it has had all the charm of originality. She has never fallen into the error which so often beset even so great a writer as Dickens, of writing of conditions of society which lay beyond her actual experience.

HENRY IRVING AS HAMLET.

THE CRITICISM OF SALVINI.

In the *English Illustrated* for September, Mr. Henry Irving discourses upon four favourite parts of his. Those Shakespearean parts which he chiefly loves are Hamlet, Richard III., Iago, and King Lear. He is prompted to write this paper by the curious perversity which has prompted some distinguished artists to decry the art of acting. Mr. Irving says that "To leave upon your generation the impression of Hamlet as the man, not as a piece of acting, is perhaps the highest aim which the English-speaking actors can cherish."

This being so, it is interesting to know what Salvini says of the impression produced upon him by Irving's presentation of that part. The passage will be found in the autobiography of Salvini, which appears in the *Century Magazine* for September:—

I was very anxious to see the illustrious English artist in that part, and I secured a box and went to the Lyceum. I was recognised by nobody, and remaining as it were concealed in my box, I had a good opportunity to satisfy my curiosity. I arrived at the theatre a little too late, so that I missed the scene of Hamlet in presence of the ghost of his father, the scene which in my judgment contains the clue to that strange character, and from which all the synthetic ideas of Hamlet are developed. I was in time to hear only the last words of the oath of secrecy. I was struck by the perfection of the stage-setting. There was a perfect imitation of the effect of moonlight, which at the proper times flooded the stage with its rays or left it in darkness. Every detail was excellently and exactly reproduced. The scene was shifted, and Hamlet began his allusions, his sallies of sarcasm, his sententious sayings, his points of satire with the courtiers, who sought to study and to penetrate the sentiments of the young prince. In this scene Irving was simply sublime! His mobile face mirrored his thoughts. The subtle penetration of his phrases, so perfect in shading and incisiveness, showed him to be a master of art. I do not believe there is an actor who can stand beside him in this respect, and I was so much impressed by it, that at the end of the second act I said to myself, "I will not play Hamlet! Mapleson can say what he likes, but I will not play it;" and I said it with the fullest resolution. In the monologue, "To be, or not to be," Irving was admirable; in the scene with Ophelia he was deserving of the highest praise; in that of the Players he was moving, and in all this part of the play he appeared to my eyes to be the most perfect interpreter of that eccentric character. But further on it was not so, and for the sake of art I regretted it. From the time when the passion assumes a deeper hue, and reasoning moderates impulses which are forcibly curbed, Irving seemed to me to show mannerism, and to be lacking in power, and strained, and it is not in him alone that I find this fault, but in nearly all foreign actors. There seems to be a limit of passion within which they remain true in their rendering of nature; but beyond that limit they become transformed, and take on conventionality in their intonations, exaggeration in their gestures, and mannerism in their bearing. I left my box saying to myself: "I too can do Hamlet, and I will try it!" In some characters Irving is exceptionally fine. I am convinced that it would be difficult to interpret Shylock or Mephistopheles better than he. He is most skilful in putting his productions on the stage; and in addition to his intelligence he does not lack the power to communicate his counsels or his teachings. Withal he is an accomplished gentleman in society, and is loved and respected by his fellow-citizens, who justly look upon him as a glory to their country. He should, however, for his own sake, avoid playing such parts as Romeo and Macbeth, which are not adapted to his somewhat scanty physical and vocal power.

The traditions of the English drama are imposing and glorious! Shakespeare alone has gained the highest pinnacle of fame in dramatic art. He has had to interpret him such great artists as Garrick, Kemble, Kean, Macready, Siddons,

and Irving; and the literary and dramatic critics of the whole world have studied and analysed both author and actors. At present, however, tragedy is abandoned on almost all the stages of Europe. Actors who devote themselves to tragedy, whether classical, romantic, or historical, no longer exist. Society-comedy has overflowed the stage, and the inundation causes the seed to rot which more conscientious and prudent planters had sown in the fields of art. To win the approval of the audience, a dazzling and conspicuous *mise-en-scène* does not suffice, as some seem to imagine, to make up deficiency in interpretation; a more profound study of the characters represented is indispensable. If in art you can join the beautiful and the good, so much the better for you; but if you give the public the alternative, it will always prefer the good to the beautiful.

DERELICTS AND THEIR ADVENTURES.

MR. W. J. GORDON, in the *Leisure Hour*, in the course of his interesting articles upon sea-life, refers in September to the subject of derelicts. He says:—

In the North Atlantic alone there are generally sixteen afloat every day in the year, and in one month forty-five were recently reported, five-and-twenty of them in the vicinity of the five "steamer lanes" used by the Cunard, White Star, American, Guion, and National Companies; and yet, dangerous as they may be, collisions with them hardly ever happen in the daytime, and only occur at the rate of eight a year, which speaks well for the carefulness of the look-out that our merchant-seamen keep.

The ways of the derelicts are interesting and peculiar. There was one vessel that broke in half in the North Atlantic just where two currents passed, and one half went north and the other south, and they came ashore with more than a thousand miles between them. The *Manantico*, first reported abandoned on December 8th, 1886, in 39° N. 72° W., was last seen in 28° N. 36° W. on July 12th, 1887, after a drift of 2,600 miles in 206 days. The *Vincenzo Perrotta*, abandoned in September, 1887, in 36° N. 54° W., came ashore at Watling Island in April, 1889, after a drift of 2,950 miles in 536 days. The *Telemach* about the same time drifted 3,150 miles in 551 days. Two schooners abandoned during the same gale in November, 1888, on the American coast drifted 4,400 and 4,800 miles in 370 and 347 days respectively. The *Vestalinda*, abandoned in November, 1891, was last reported in April, 1892, after drifting 2,230 miles in 151 days. One of the longest drifts of abandoned ships on record is that of the schooner *W. L. White*, abandoned in March, 1888, in 39° N. 73° W., which came ashore at Hasker Island, one of the Hebrides, in January, 1889, after a drift of 5,910 miles in 310 days. Obstacles these, for the early destruction of which some means ought to be discoverable. A miss may be as good as a mile, but shaving must be embarrassingly close when it comes to passing, like the barque *Virgo*, between two masts of a derelict in a state of submergence.

Occasionally a derelict is towed into port and sold cheap, to be patched up again and tempt fortune until she makes her second appearance, usually under another name, in the list of total losses. For, account for it as you please, a ship once unlucky is always unlucky, although you may change her name to hide her identity. Even in the Royal Navy there have been ships whose names have been changed two or three times, and they have met with disasters under each designation.

In *Longman's Magazine*, in "At the Sign of the Ship," Mr. Andrew Lang discourses concerning *Borderland*, somewhat justifying the bishops for refusing to give their opinion when asked on the ground that it was no part of a bishop's duty to give away gratuitous advertisements. From this it would follow that a bishop had better keep his mouth always shut, if he should never speak when his advice is asked for fear lest his counsel should be used for advertising purposes—a plausible plea for dumb dogs surely!

MR. LUKE FILDES, R.A.

HOW HE PAINTED "THE CASUALS."

IN the *Strand* for September Harry How selects Mr. Fildes, R.A., as the subject of his illustrated interview. The paper is better illustrated than usual, and the frontispiece of the magazine is a reproduction of Mr. Fildes's famous picture "The Doctor." There is plenty of good gossip in the interview.

TWO LOVERS IN A BOAT.

Among other things, Mr. How tells us how the artist gained his wife:—

Mr. Fildes and Henry Woods went by the Thames to sketch. Henry Woods had two sisters, and they came up on a visit to their brother, and stayed where the two young artists were working. Miss Fanny Woods often sat to one of these artists. She is the girl sitting down in the stern of the boat in the picture of "Fair, Quiet, and Sweet Rest," which was hung on the line and "centred" in the Royal Academy of 1872. The picture was quickly "noticed"—it was the first work of an unknown painter. And 1873 brought "The Simpletons"—two lovers in a boat! But it was not until the summer of 1874 that Miss Fanny Woods became Mrs. Luke Fildes.

"THE CASUALS."

One of Mr. Fildes's most famous pictures is that of "The Casuals." The following is the account of the way in which he painted it:—

Mr. Fildes always had a leaning towards "The Casuals," and in 1874 he painted it. That, too, was a 9-ft. canvas. The picture is too well known to need description here—the mud and slush of the street, the suggested fog, the drunken loafer, the ruffian who "wants work, but wouldn't do it," the long, thin youth in the background, the sham soldier, the wife and husband cuddling up their children, the widow (who perhaps had never been a wife) hastening along, the policeman, and the bitter sarcasm of the "notices"—posted immediately above the poor fellow who holds his little one so tightly to him—"Child Deserted, £2 Reward!" and "Lost a Pug Dog, £20 Reward!" But what stories the artist has to tell of his models for that remarkable work!

MODELS FROM THE CASUAL WARD.

"I used to go out night after night," said Mr. Fildes, "and seek for types. I visited the various casual wards, and soon got to know the inspectors. If I saw anybody who took my fancy I gave him my card, and asked him to come round after he had picked his oakum. You notice that fellow with his head bent down in the picture? He came to see me one morning wringing wet, and after sitting for a few minutes in the hall he was surrounded by a pool of water! Some of these people I had to stand in my studio on brown paper, and put disinfectants round them. The drunkard—that fellow with his hands thrust deep into his pockets—was a perfect character. He would not sit to me without a quart pot by his side, which I had to keep continually filled.

"The policeman I borrowed from Bow Street. The long, thin lad at the back, whom I found in a casual ward, was a stowaway. He was a lad of sixteen, and six feet high. He had tramped everywhere. He stowed himself away on a boat going to America, was discovered, flogged, transhipped on another boat, pitched ashore at Liverpool, walked to London, and slept in the parks till I came across him. One of these fellows in the picture walked up and down outside my house all night, so that he shouldn't be late in the morning! How he escaped the police is a mystery."

"The Casuals" created a great sensation. It made a wonderful impression. Nothing at once so dramatic and real had been seen for years. The status of Mr. Luke Fildes arose at a bound. It was bought by the late Mr. Thos. Taylor, who also purchased "The Widower." Mr. Taylor's collection was eventually sold at Christie's, and "The Casuals" was sold to Sir George Holloway for 2,000 guineas, who stated afterwards that he had made up his mind to buy it, and was prepared to go to £4,000 for it. The picture now hangs in the Royal Holloway College, Egham.

ALL THE OLOGIES.

IN the *American Catholic Quarterly Review* for July the Rev. Thomas Hughes, writing on "Anthropology," gives the following extract from an American University treatise on Anthropology, showing how the modern scientists in America divide up the study of mankind into various branches of Anthropology:—

Phenomena.	Science.
All mankind as natural objects . . .	Anthropology.
WHAT MAN IS—STRUCTURAL ANTHROPOLOGY.	
The embryo of mankind and life of the individual . . .	Ontogeny.
The body of man (specific and comparative) . . .	Anatomy.
The functions of the body . . .	Physiology.
Form and colour, weight and number . . .	Anthropometry.
The nervous system in relation to thought . . .	Psycho-physics.
Natural divisions of mankind . . .	Ethnology.
WHAT MAN DOES—FUNCTIONAL ANTHROPOLOGY.	
To express his thoughts . . .	Glossology.
To supply his wants . . .	Technology.
To gratify his desires . . .	Esthetics.
To account for phenomena . . .	Science and Philosophy.
To co-operate in the activities and ends of life . . .	Sociology.
In presence of a spirit world . . .	The science of religion.
THE PAST OF HUMAN LIFE AND ACTIONS IS STUDIED—	
1. In things decayed or dug from the earth . . .	Archæology.
2. In the decipherment of inscriptions . . .	Palaography.
3. In the acts and sayings of the unlettered . . .	Folk-Lore.
4. In written records . . .	History.
SCIENCES HELPFUL TO ANTHROPOLOGY.	
To determine the material of art-products . . .	Mineralogy.
To fix the age of relics . . .	Geology.
In studying the mutual effects of man and the earth on each other . . .	Geography.
To determine man's place in nature and his acquaintance therewith . . .	Botany and zoology.

What People Read in the East-End.

THE *Young Woman* for September publishes an interesting interview with Miss James, the librarian of the People's Palace, as to what people read in the East-End:—

The library will accommodate 250,000 volumes, of which only a little over 12,000 have been gathered. The galleries are reached by spiral iron staircases, and books are sent down to the centre by means of lifts. The cost of the library is between £800 and £900 a year. From 1,200 to 1,400 persons on an average use the library daily, and from 130 to 200 books are issued. The six most popular books in the library are Dickens's "Martin Chuzzlewit," Haggard's "She," Dumas's "Monte Cristo," Kingsley's "Westward Ho!" Stevenson's "Treasure Island," and Mrs. Henry Wood's "East Lynne." Meredith is occasionally asked for, Hardy frequently—or, at least, his "Tess" and "Under the Greenwood Tree"; we have only these two of Hardy's in the library, and they are very popular. Many try Mrs. Humphry Ward's "David Grieve," but they generally give it up. Amongst women and girls, Edna Lyall, Miss Warner, Miss Fothergill, Hesba Stretton, Miss Braddon, and Mrs. Henry Wood are most popular; whilst Henty, Kingston, Ballantyne, Marryat, Fenn, and Jules Verne are the boys' favourites. Poetry is seldom asked for, except Shakespeare, Tennyson, Browning, and Longfellow. Browning is read in the East End to some extent—by the better-educated people.

A NOTABLE "TIMES" CORRESPONDENT.

A SKETCH OF MR. W. J. STILLMAN.

MR. W. P. GARRISON, in the *Century* for September, publishes a very appreciative sketch of Mr. W. J. Stillman, the well-known *Times* correspondent at Rome. The paper is illustrated by a striking portrait. Mr. Stillman is an old contributor to the *Century*, and Mr. Garrison might with advantage have given us a much longer sketch. Mr. Stillman was born in the State of New York in the year 1828, and he very early received an impetus which decided his destinies. He was, says Mr. Garrison, of a restless temperament.

HIS ADVENTURES WITH KOSSUTH.

As if to set a seal on his unrest, fate would have it that the youth of twenty should graduate from Union College in 1848. Though he took at once to landscape-painting under Church, his ardent temperament could not be insensible to the revolutionary glow of the period, and Kossuth's arrival in this country in December, 1851, fully enlisted Stillman in behalf of the Hungarian cause, and gave him his first introduction to the complex "Eastern Question," which was to absorb the best thoughts and the best energies of his life. In 1852 he accepted from Kossuth a perilous mission to Vienna, to bring away the crown jewels secreted by the exiled chief. I have heard him tell how, when his task seemed hopeless and the chance of his arrest unpleasantly good, he chose a stormy night to commit to the Danube his compromising credentials. The boat that hid them in its heel had hardly splashed in the river before he was challenged by a guard, who good-naturedly smiled at his bad German, and let "a foreigner" pass. The amateur revolutionist quickly made his way to Paris, and, taking up his brush again, entered an atelier.

HIS FRIENDSHIP WITH RUSKIN.

This was Stillman's second visit to Europe. His first was in 1849, when Ruskin was midway in the publication of his "Modern Painters," and was hanging out his "Seven Lamps," when, coincidentally, the Pre-Raphaelite Brotherhood was in the first twelvemonth of its existence. Acquaintance with Rossetti and the other leading spirits of this movement made of Stillman a true believer. With Ruskin, whose conversion came later, in 1851, he struck up the warmest friendship, and subsequently named for him his ill-starred first-born. The personal affection outlasted his detachment from the doctrine of that eloquent but incoherent moralist. After twenty years he could proclaim publicly that "Ruskin's art-teachings are utterly wrong." Meanwhile, in 1855, under the double influence of the prophet and the Brotherhood, he founded, with John Durand, the short-lived "Crayon" in New York; and, though he still continued to exhibit at the Academy of Design, of which he had become an associate member, the litterateur began to get the better of the artist.

PAINTER AND PHOTOGRAPHER.

This brought Stillman into familiar and delightful intercourse with Lowell and the Cambridge circle of wits, scholars, and savants. He joined a choice band of them in the Adirondacks in the summers of 1858 and 1859, and there was painted—I believe in the former year—his best-known and most poetic piece, "The Procession of the Pines." Of this company Stillman was the guide, philosopher, and friend. . . . Firearms have always been a passion with Stillman, and they typify his spiritual combativeness, his readiness to engage in controversy. His innate mechanical inventiveness has chiefly been expended upon cameras, for he has practised, experimented in, and written authoritatively about photography for more than a quarter of a century, and twenty years ago he published a manual of the art.

AMERICAN CONSUL AT ROME AND CRETE.

The camera has but confirmed the practical divorce from the palette effected by his acceptance of office in 1861 under the administration of Lincoln. To use his own words:—

It was my misfortune to spend eight years of my life in the consular service of the United States. From the first post,

that at Rome, I was removed to silence my remonstrances against the disgraceful state of our legation there; and, after our usual shopkeeping system, I was sent to a distant station at my own expense, after having been financially ruined by my official countrymen at Rome.

The new station was Crete, where, in the spring of 1865, Stillman was brought face to face with "the unspeakable Turk," at a time when the island was on the eve of a fresh revolt. The history of this episode must be read in his "Cretan Insurrection." His complicity with the insurgents consisted in nothing more than being a sort of postman between them and Europe. Stillman naturally came to be regarded, both at Athens and at Constantinople, as the head and front of the rebellion. The persecution he had to endure in consequence from the local authorities and Mussulman population in Candia made him almost a prisoner in his house, and finally drove him to transfer the consulate to a yacht. As the rebellion languished to its end, the Turkish government obtained from Secretary Fish his removal.

STORMY PETREL 1876.

After the "Cretan Insurrection" Mr. Stillman did nothing so notable as the part which he took in the enlightenment of public opinion on the subject of Turkish misrule. In 1875 and 1876 he spent much time in and about Montenegro and Herzegovina, and his letters undoubtedly did much to pave the way for the subsequent disruption of the Ottoman Empire. Afterwards, when the war broke out, he did yeoman's service as *Times* correspondent in Montenegro. I remember Mr. Gladstone saying at the time that Stillman's correspondence from the seat of war was the only reason in 1877 why he felt it necessary to look at the *Times* at all. After the war was over, he became the regular correspondent for the *Times*, wherever the situation promised to be stormy.

In the service of the *Times*, Athens was revisited in 1885. He revisited also the island of Melos after an interval of a dozen years. He also began with ardour the study of Greek archaeology, especially in connection with the huge constructions which are styled Pelagic, and which he has traced more thoroughly than any one, and pictured with his camera, up and down the Italian peninsula, in Sicily, in the Greek archipelago, and on the mainland.

He is now settled at Rome, but it needs no prophet to foresee that if there is once more unrest in the Balkan Peninsula, or in Austria-Hungary, Mr. Stillman will have to leave the Eternal City, betake himself once more to the regions with which he is so familiar, and dwell among the peoples for whose liberation he has already achieved so much.

Motor Engines for Cycles.

IN *Cassier's Magazine* for August the writer of the article on "Modern Gas and Oil Engines" speaks very highly of the Daimler motor. This motor is built by the Daimler Company of Cannstatt, and uses either gas or gasoline. In Stuttgart it is used for propelling street cars, and on some German railroads for driving inspection cars. It is also found favourable for the propulsion of road carriages, quadricycles and even bicycles. The English firm is Sims and Company, and they are said to be actively prosecuting its introduction to British territory. *Cassier* gives a picture of two riders seated on a quadricycle propelled by a Daimler motor. As there seems to be no danger of being blown up, this motor ought to be popular with cyclists, for it can be turned on and off at a moment's notice. It would be invaluable for steep hills. The writer, however, does not give particulars as to the increase in weight added by the Daimler motor. As you can buy gold too dear, so a cycle motor might be more heavy than its worth.

THE AUSTRALIAN CRISIS.

THE PROPHECY OF THE PESSIMIST.

In the *Investors' Review* for August, Mr. Wilson has two articles—one on "Australian Banks, Failed and Other," the other on "Braggart Queensland." In both of them he prophesies all manner of evil concerning the position in Australia.

A WORSE CRISIS COMING.

The crisis in the Australian colonies has but reached its second stage. In a little while the storm must break out again more fiercely than ever. What should have been done had any real intention existed to deal with the facts as they stood was to throw all these failed banks into liquidation. The whole of the uncalculated capital ought to have been secured absolutely to existing creditors as a first step. That done, it would have been open to capitalists in the colonies or here to create one or two new banks to take up what genuine business these wrecks had left. To these new institutions, under adequate supervision, the collection of the assets of the failed banks might have been confided; or, if that had not been practicable, one or more nursing trusts might have been constituted for the express purpose of holding the assets together until such time as they could have been realised. With might and main, therefore, "reconstruction" was forced through, and the end of a shameful career of chicanery and fraud will be ruin tenfold more irretrievable than could have been caused by honest liquidation. These miserable settlements have little prospect before them but to lie waterlogged with debts for at least a generation.

OVER-BANKED AUSTRALIA.

One great cause of the matter is that Australia has far too many banks for its population. The contrast with Scotland is very marked in this respect:—

Altogether Scotland possesses banking resources to the extent of £118,000,000, but of this sum it may be estimated that not more than £70,000,000 at the outside is directly engaged in banking business within the country. The amount may not exceed £60,000,000, for not only have the Scotch banks £24,000,000 invested in securities, or advanced upon stocks, but they have always large sums employed in the London market—how large there is no means of knowing, but they must aggregate at least £10,000,000. Therefore, the lowest of these estimates may be an exaggeration; but put the total at £70,000,000, and contrast this with Australia and New Zealand. Before the recent smashes the total banking resources of these colonies amounted to £208,000,000. With this money the people had no manufactures to speak of to carry on; their only exports consisted of agricultural and pastoral produce, than which nothing is more precariously profitable, less capable of bearing one year with another high banking charges. And in spite of this prodigious amount of money the colonists were always hard up.

THE PROSPECT OF QUEENSLAND.

In his essay upon "Braggart Queensland," Mr. Wilson says:—

From the very start the Queensland has been the Gascon of Australasia. All his ideas have been coloured by the immensity of his territory. As a bragger he has few equals and no superior.

It was a poor territory, nevertheless, and in great measure a territory unsuited for permanent settlement by the men and women of our northern race sent to occupy it. The letters of the *Times* special correspondent on Queensland and other Australian colonies are as near as possible worthless for the essential purpose of revealing the true economic condition of these settlements and of appraising their actual wealth. And where she can see for herself and speak from her own observation, she expresses invaluable truths. Hers is "the honest eye which sees" when it can get outside the official magic ring. Therefore we think the description given by her of the lot of labour in Queensland heart-moving in its sadness.

THE DOOM OF THE COLONY.

The danger which now threatens these miserable deluded Australian settlers is not merely that of becoming bankrupt in pocket, of ceasing to pay their way. Were their population larger, such is the hatred and contempt felt for the character of the men whom universal suffrage and "payment of members" have brought into power, we should fear revolutions and a period of anarchy. Sparingly peopled as the territories are, the actual danger to some of them is of depopulation. All who can will escape from the debt curse, and seek peace in happier lands. Those who remain will rebel against the demands of the fundholder, or will simply lie down like the over-loaded camel and refuse to get up till the weight is reduced. Queensland will go to pieces.

MR. FREDERIC HARRISON ON ART.

In the *Forum* for August, Mr. Frederic Harrison replies to the critics who found his previous dissertation on art too pessimistic. He defends his views with his customary vigour, and preaches an eloquent little homily upon a text in Timothy. Speaking of the defects of our modern art, he declares that they are irremediable. At least—

There is no practicable remedy—or none of the immediate and direct kind. The only true remedy is that contained in the Apostle's words to Timothy:—"They that will be rich fall into temptation and a snare, and into many foolish and hurtful lusts, which drown men in destruction and perdition." And it is as true for the artist or the poet to-day as it is for the divine and the disciple, as it was true for the Apostle's own son in the faith, whom he had left in Ephesus:—"But thou, flee these things; and follow after righteousness, godliness, faith, love, patience, meekness."

Although Mr. Harrison puts his text at the end of his article instead of at the beginning, as most preachers do, he strays from it with as much ease as if he were in the pulpit. The following sentences embody his chief contention:—

We shall, no doubt, again have an age when Synthesis will weigh more than Analysis, and Conception of the Whole more than Observation of the Parts. We shall have again an age of coherent ideas;—and when we have that, we shall have another age of Great Art. It is in vain to look for any very great art, either in literature or in the special arts of form, under the reign of universal Specialism. The camel of Holy Writ will have passed through the eye of the needle long before supply and demand will ever have succeeded in creating a great art. And men will be gathering grapes of thorns and figs of thistles the day that Art Exhibitions promote immortal works. Everything that we love in art had its own time, place, occasion, inspiration. Titian, Velazquez, Rubens, and Vandyke, painted noble gentlemen and ladies in the costumes in which they lived, to hang in their own halls, amidst artistic surroundings of absolute harmony. Your R. A. to-day paints a bill-discounter in a red hunting-suit and breeches and a fur topcoat; he charges him a thousand guineas; and the bill-discounter is very proud. Raffaele and Bartolommeo painted Saints and Madonnas to place over altars; Veronese painted sumptuous groups for Venetian palaces; Rembrandt painted the men and the scenes amongst which his life was passed, exactly as he saw them, and for those who loved them. We have to rack our brains for novel subjects, and first and foremost, we have to satisfy the dealer.

He concludes his article as follows:—

This is not the place, nor have I space left here, to explain all I mean, when I say that art is a mode of religion, and can flourish only under the inspiration of living and practical religion. In the meantime, I would say but one word to the ingenuous youth who aspires to be an *artist* that he should shudder to become a *tradesman*, that he take up his high calling with "love, patience, meekness"—that he hold fast by all that is pure, all that is beautiful, all that is broadly human.

THE BRITISH ARISTOCRACY AND KING DEMOS.

VARIOUS NOTES AND COMMENTS. BY PEERS AND OTHERS.

THE article which appeared in the last number of the *REVIEW OF REVIEWS* has excited very widespread interest and discussion. I posted a copy of the *REVIEW*, with an accompanying letter asking for suggestions, to every peer in the United Kingdom, and to those eldest sons of peers who were old enough to have their own establishments. Most of the peers who answered my appeal—beyond merely acknowledging it—did so in terms of general approval, coupled with the natural and inevitable objection to this, that, or the other suggestion.

LORD GREY'S DISSENT.

There were, however, some who dissented almost entirely, and foremost among these stands the Northumbrian Nestor, Earl Grey, who is as keen a politician in his ninetieth year as Mr. Gladstone is in his eighties. Lord Grey writes:—

I am sorry to say that, although your article contains some remarks in which I concur, I entirely dissent from most of your views. I consider you to be unjust to the British aristocracy and clergy, and to have made a great mistake in neglecting to point out that most of what King Demos has to complain of has arisen from the misuse of the supreme power with which he has been invested by the changes effected in 1866 and since in the constitution of the House of Commons, by which, instead of its former high character, it has been degraded to its present deplorable condition, and now shows itself to be utterly incapable of discharging its high duties with advantage to the nation. If I was still as able to discuss the subject as I should have been twenty or thirty years ago, I should probably have attempted to explain to you my reasons for holding this opinion; but now, when I am fast approaching the close of my ninety-first year, I am quite unable to do so.

THE PEER ONLY GREAT AS A LEGISLATOR.

Some of the peers object so much to the incidental suggestion that they might do well to sacrifice their legislative functions in order the better to exercise their local social sovereignty, as to ignore the fact that the suggestion was not insisted upon, but merely thrown out by the way. Lord Saye and Sele writes from Sunbury House, Reading, contending that the legislative position of the peer is essential to his local prestige. He writes:—

I would gladly see your ideas carried out, but I know they have been tried and have utterly failed. You are wrong in considering the peers as a body to be the great of the land. Except where they are legislators they differ not from other men; they are not more influential, nor are they better nor worse than those around them. In this county (Berks) John Walter and Richard Benyon tower over what you call the aristocracy. In the adjoining county (Oxon) although there was a resident duke, a commoner only a short time ago was the Lord-Lieutenant. There are peers and peers—some are fossils, some mushrooms, some of them are lawyers and some clergymen, and many have been or still are in the Army and Navy and other professions, and the majority of them, I hope and believe, endeavour to do their duty towards their fellows. A baronet is quite as big a man as a peer.

LORD ABERDARE'S WARNING.

Much in the same sense writes Lord Aberdare, from Duffryn, Mountain Ash, South Wales:—

I have read with great interest your paper on "The Wasted Wealth of King Demos," for sending me which I heartily thank you. There are portions of it which do not command my assent, but it does not follow that even to me it would, therefore, seem to be infructuous. Agreeing with much, I

shall refer to one objection, and one only. Your conditional precedent for the utilisation of a lord is that he should cease to be a peer. You do not seem to have asked yourself how much of the influence which you would turn to such good account depends upon the fact that, in spite of the widespread unpopularity of the House of Lords, a peer is still respected as a member of that House and an hereditary one. Such divinity as doth hedge a lord largely rests upon that fact. That feeling may be denounced as superstition, flunkeyism, and what not. It may be held up to scorn as unreasonable and degrading; but there it is, and there it will be for many a long year, growing probably weaker and weaker, as the Demos gets stronger and wiser, but still exerting a power which would be wanting to a mere landowner. I do not deny the influence of the untitled landowner who happens to be at once wealthy, able, and public-spirited. I am only arguing that such a landowner, if also a peer, would loom far larger in the public eye, and therefore have a larger capacity for good. It is painfully true that many peers have fallen short of their duties. But if examples are only too frequent of wasted opportunities, there is happily ample proof of a heightened sense of responsibility in the majority. How many a peer, conscious of the duties attaching to the possession of rank and fortune, is seen to exert an influence far exceeding the measure of his abilities and force of character, which are supplemented by the weight which rank and fortune have given him! The number of such men—men like the late Lord Carnarvon, the Duke of Westminster, and many others—is constantly, and I believe rapidly, increasing. This, of course, is not a question which cannot be decided by statistics. It seems to me, looking back upon more than three-quarters of a century, palpably certain. As for suggestions, I have none to offer. If the territorial aristocracy are so insensible to their duties, so blind to the signs of the times, as to neglect both their fate is assured, and I do not believe that it can be averted by the formulation of any scheme or the foundation of any association. They must, in my opinion, be left to the good influences which pervade society with ever-increasing force, among which I give no small space to views like yours, supported with earnest eloquence, and animated by the desire of conserving all that is good and sound in our body politic.

THE PEER AS A PUBLIC INSTITUTION.

From a peer resident in the home counties, who has large Irish estates, I receive the following expression of opinion, which is interesting and suggestive:—

In a great deal of your article I fully agree. Lord Beaconsfield once said that a peer of England was a greater man everywhere than in the House of Lords, and I have repeatedly acknowledged in public the gratitude which every peer owes to his countrymen for their generous readiness to give him every opportunity of making himself useful if he is willing to embrace it. I speak from twenty-three years' experience when I say that, even in these democratic days, rank, as such, attains if anything more than its due weight for its owner on any public occasion. I entirely sympathise with your view that a peer should regard himself as a public institution with public responsibilities, and that the implied condition of the existence of a leisured class is that its members should devote themselves, individually and collectively, to the public service. Until Mr. Parnell succeeded in ostracising from public life all who were not his supporters I was able to be of some little use as a public man. The Land Act deprived me of the control of the agricultural portion of my estate, to the improvement of which till then I had devoted a considerable sum. It also rendered me comparatively impotent in all matters affecting the quarrels and litigation amongst themselves in which my tenants had previously been only too glad to accept the arbitration either of myself personally or of

my agent. I represented for a time a division of my English county in Parliament, and my eldest son has for more than thirteen years done the same. I have been twice returned unopposed as an elected member for my own district in the County Council, and was offered unsolicited the same honour by a neighbouring district reputed the most radical in the electoral division. I can honestly say that no public call has ever been made upon me to which I have not done my best to respond. Excuse the egotism of this letter. I mention these facts in no spirit of self-praise, but because I believe my case is merely that of dozens of my order who are trying to do their duty in that state of life into which it has pleased God to call them to the best of their ability. My children have all been brought up to throw themselves into every work around them to which they can add to the comfort and pleasure of their poorer neighbours. They have their reward in the kindness with which their efforts are received. In the House of Lords itself I have never had any difficulty in gaining an attentive hearing upon any question which seemed to me of sufficient importance to be brought forward; and as a moderate Conservative I have had the satisfaction of seeing almost all of the old Liberal friends in both Houses with whom I started in early life now ranged upon the same platform as myself. I am not much afraid of Demos in home affairs if English good-sense is not outvoted by Irish sentimentality. What I do fear is the effect which rash decisions, taken by those who have never thought out the subjects, may have upon our foreign policy, our colonial relations, and above all upon the future of our Indian Empire. If the House of Lords does not exist for the good of the country the reason for its existence is gone. I believe that it does so exist; and I do not feel myself the down-trodden creature to whom you allude in the earlier part of your article.

"BETTER BROWN OR SNOOKS THAN A PEER."

An esteemed correspondent, who writes to me thus from R.Y.S. *Black Pearl*, off Dartmouth, sees the other side of the shield:—

Your article in the last August number of *THE REVIEW* or *Reviews* on the British aristocracy interested me enormously. There is only one thing I want to say, and that is that you seem to me to rather overrate the possible influence of individual peers in their own district. To me they seem a very conscientious rather overworked body, whose exertions are not repaid with the respect that we should give to the efforts of more private individuals. As you say, they keep the county museums and pleasure-grounds, and into the administration of their estates they put all the common-sense, kindness and grit that nearly all Englishmen possess. They have the influence in their native places that wealth is bound to bring with it, but in spite of their good work as county councillors and general purveyors to the public good they are less considered than would be the merest carpet-bagger. One story in illustration of this I heard only the other day. Lord Pembroke, who is one of the most public-spirited of country gentlemen, whose work on his estate is a well-known thing to all his neighbours, and who, besides this, is, as you know, one of the most cultivated and liberal-minded men in England, makes a point of every year making a speech upon some political question of importance to his assembled tenants. He took, a few years ago, as the subject of his discourse, Home Rule, and as it is a question on which he feels very keenly, he took an extra amount of trouble, and delivered an able speech, which made a great impression on the minds of all the educated people who heard it. One of these, Lord Suffolk, was travelling soon after through Wiltshire, when a tenant of Lord Pembroke's got into the railway carriage, and they not unnaturally began discussing the recent meeting at Wilton, both expressing the highest approval of all that Lord Pembroke had said; and Lord Suffolk suggested the advisability of having the speech printed and distributed. "That wouldn't be any use, my lord," answered the farmer; "if it had been Brown or Snooks who'd made the speech the people would pay some attention to it, but as it's by Lord Pembroke, no one would read it—the masses always think the classes are working

for their own advantage, and consequently don't heed them." This is only one of a hundred stories I could tell you had you patience to hear me—it is a particularly good instance, as it is about a really popular man. Perhaps you will wonder why I should write all this to you; only I know you respect all points of view, and mine is that of an onlooker who has seen something of the game. The peers you attack cannot write back and sing their own praises, telling you of all their good actions, and that is partly why I write this.

THE GRATITUDE OF DEMOS!

A South-country peer writes me a private letter, from which I take the following extract:—

I agree with a good deal of what you say, but do not feel hopeful of your suggestions being generally acted on; and even if they were, I doubt the results coming up to your expectations. Provided a landlord does not actually neglect his estates, no one I think is either surprised or aggrieved if he does no more. If, however, he interests himself in local affairs and local institutions, people very soon take it as a matter of course, and show their gratitude by endeavouring to work a willing horse to death. I believe that there are a very great number of county gentlemen who make themselves very useful in their own neighbourhoods; but it is no doubt true that some of the richest and most conspicuous families do little or nothing. This is bad for everybody, and I should be very thankful if it were less common; but some of the most notable examples of it would be strong candidates for almost any constituency, if that is a test of the appreciation of Demos. I do not know the north of England, but I should expect that Lord Londedale would be a much stronger candidate than Lord Percy, and would probably have run Mr. Morley much closer for Newcastle than the highly respectable Mr. Ralli.

LORD WINCHILSEA'S RESPONSE.

Lord Winchilsea dealt with my appeal in a leading article published in his admirable weekly *The Cable*. The article, which is signed, is headed "The Great Opportunity." Lord Winchilsea says:—

We welcome with peculiar pleasure a testimony to the truth of doctrines often advocated in these columns, which, coming as it were from the enemy's camp, and from one who does not hesitate to describe himself frankly as a hostile witness, may be considered as conclusive.

Mr. Stead is, in fact, a Radical of the Radicals, and a loyal supporter of the reign of King Demos, who he believes "has come to stay." But he is also a shrewd observer of his own times; and being honestly desirous to improve them, he is too much in earnest to shut his eyes, merely because he would have had it otherwise if he could, to the vast store of latent energy which resides in a body of men who are members of an order which is coeval with our history, and closely identified with all the triumph of the Anglo-Saxon race.

Lord Winchilsea continues—

Mr. Stead's appeal to the public-spirited among the peers merits, and we hope will receive, far more than a passing attention. He invites them, in fact, to take that foremost place in the country life of England, their assumption of which, he assures them, would be heartily welcomed by King Demos himself, and would be certain at this critical moment to exercise a profound, perhaps a decisive, influence upon their own fortunes. How much might be done if noble lords, especially those who happen to be Lord-Lieutenants of counties, would make their old historical homes the centres, in a true and real sense, of the modern public life of the county, by occasionally inviting members of these different public bodies to meet in conference within their walls upon one or more of the many subjects of importance with which they are called upon to deal.

But our agricultural readers have a more direct interest than they are perhaps aware of, in adding their exhortations to those of Mr. Stead. Whatever else the peers may be, one thing they undoubtedly are—the natural leaders of the agricultural interest. Their fortunes are not as deeply rooted in

the soil as the very oaks on the ancestral estate from which, perhaps, it takes its name, nor is there a service so important, or any which would be productive of more benefit to the community at large, as well as to their own individual interests, than they could render at this moment by laying aside their wonted indifference, and placing themselves at the head of their tenants and labourers, in order to make one great and combined effort in the cause of agriculture.

Obvious, indeed, must be the duty, and great the opportunity, when the trumpet which summons the peers of England to take their rightful place as the vanguard of the social army, sounds from the very heart of the Radical camp, and who shall say whether, if they refuse the call to which honour, duty, and interest alike prompt a ready obedience, it will ever again be renewed?

WHAT ARE THE LANDLORDS DOING?

Lord Cantelupe sends me from The Manor House, Bexhill, some excellent and timely observations:—

I thank you for THE REVIEW OF REVIEWS you have kindly sent me. I have read the article referred to with great interest. I have written out what are my ideas about a peer and a landlord; I consider that it rests entirely with each individual peer to better himself and regain his power by doing his duty. I have only made a few remarks as to how it could be done, as, in fact, I hope to do myself if I live.

Suggestions.

It is no doubt absolutely necessary at the present time to recognise the fact that we are governed by the will of the people, and recognising that fact, it becomes absolutely necessary that all those in high social positions should use their power to direct if possible the will of Demos in the right way. As the article deals chiefly with peers, I will take a peer as my example. Taking it for granted that a peer who has not done anything actually wrong, starts in life with a certain amount of power because he is a peer, I do not think that that power would have much weight with the people unless he devoted himself to find out and understand their wants. If he did this, he would probably gain the confidence of the people, and he would then not have much difficulty in ruling and guiding them. There is no doubt that the power of a peer who is a large landowner, and who lives among his own people, may be very great, and if he acts rightly towards them his influence will be good. It is indeed a sad thing to see so much of our land in such a poor state of cultivation; it is to a large extent due to the enormous size of most of our farms. I have always found that a small tenant keeps his land in far better condition and makes far more out of it than the big tenant. It is only natural, if a man has 700 acres to farm, he may be quite unable through want of capital to keep all his land in a high state of cultivation, while if he only had 100 acres he could very well do so. I think the landlord is very often much to blame. It is very seldom that you come across a landlord of a large estate who goes round himself and sees his tenants, discusses the state of their land, or encourages them in any way to do the best they can to improve their farms. I believe it is quite possible for a good landlord, in conjunction with his tenants, to so improve the condition of his land as to benefit both him and the tenant. In the days of agricultural prosperity, most landlords spent their enormous incomes on luxuries and pleasure outside their counties. I wonder how much of their rents was actually re-invested in their estates? Was there even half of what came from the land replaced upon it? If that had been done, would our land have ever become so poor as it is now—would it really have become almost impossible for us to compete with foreign trade? I think not; I think that if landlords and tenants in those days of prosperity had thought more about the source of their wealth, and had supported it, England's agricultural position would not have been what it is at present. And now in the days of adversity what are the landlords doing?: have they not mostly fled from their homes, their people, and their land, on the plea of poverty—certainly, a true enough one, but not justifiable? Would it not have been a noble and pluckier action to remain in their

homes, living quietly and as cheaply, working as they might easily do to improve their condition and that of their people? What encouragement is there for a poor struggling farmer to work hard to find money for a landlord whom he never sees—a man who cares so little for him that he leaves him to fight the battle alone? I am convinced that it is possible for every landowner to better himself and his estates; it rests with him alone. It is deplorable to see what is going on now in numerous cases: the landlord lives away; he takes all the rents; he spends them elsewhere giving nothing back to and doing nothing for the land and the farmer who gives him his living. Landlords have been chiefly instrumental in bringing about their own downfall; let them now set to work to regain what they have lost, which I believe they could do to a great extent, if they did their duty in that state of life unto which it has pleased God to call them.

TOO LATE!

The most interesting response I have received from any of my correspondents in the peerage is the following:—

I have read your article on the Old England party with the deepest interest, and I cannot express how thoroughly I agree with its sentiments and believe in its teaching; but I fear it is too late! The whole order is divided into two classes: those who retain the idea that they rule by divine right, and the all who oppose that rule are worthless anarchists, whose powers of judging of the views of the great outside world are atrophied by long disuse, and who verily believe themselves to be of different clay from the humanity that surrounds them. These for the most part are crassly stupid; they have intermarried, and seem unable to obtain new light on any subject. Their only intercourse with the people is that subservient parasitic class that grow up around great places, and with the masses they have never come into any sort of contact. The second division is that portion who do not care for any thing but their personal, immediate enjoyment. "What has posterity done for me?" is the motto; "why should I therefore trouble about posterity?" It is a hopelessly vulgar spirit which is spreading fast. For money, as there is none at home get an American heiress; but enjoyment is the beginning and the end. This class is the direct outcome of the Marlborough House influence. The old sense of responsibility used to restrain the lords of great estates from any exhibitions of laxness that were likely to shock the feelings of dependants, and while the loose ideas of the day did not bind very heavy burdens on these great people, allowing, for instance, the erection of small houses nestling among the trees of many great parks for the convenience of the owners' mistresses, still they went to church because it was expected of them; they gave no parties on Sunday, and they retained an idea that it mattered to the world what they were and what they did. All that is gone now, though the mistresses' houses remain, transferred from the home parks to St. John's Wood. If you had an intelligent class to deal with, they could be saved; but you have stupidity and vulgarity to meet, and both are hopeless. They wear the ermine, but have forgotten that they do so because the little beast dies at the least contact with dirt, and lies down broken-hearted to give up the ghost if its coat is soiled. If there existed within its borders sufficient intelligence, the Church and the aristocracy might both be saved; but surely on that "if" hangs the whole history of the world, with all its great volcanic changes. Your "Civic Church" would be a dead letter to peers and prelates, and yet it is written in the only language of the day; but how many have the intelligence to learn the alphabet? I would it were otherwise, for an interlude of the reign of the "wise nobleman" would be a splendid swan song before the inevitable end. But I am thankful for your article, while I do not believe they will heed, though one came from the dead!

THE LATE LORD TOLLEMACHE.

Mr. Frederick Impey, the author of the famous pamphlet of "Three Acres and a Cow," contributes to the *New Review* an interesting article upon Lord Tollemache, the labourers' lord, which is well worth reading in this con-

nation. Lord Tollemache was one of the wisest and best of modern landlords, and was the first to carry out the system of giving labourers allotments, a course which he pursued in spite of the opposition of the farmers, who at first threatened to throw up their farms if he persisted in giving their labourers allotments. He also offended many clergymen by excluding the Church Catechism from the elementary schools which he established, and also because he always gave the Dissenters the land which they needed for the building of their chapels. Mr. Impey says:—

His Conservatism was always of a moderate and conciliatory type. He had, as a young man, given much offence to his political friends in 1832 by supporting the principle of Earl Grey's Reform Bill, on the ground that a dangerous revolutionary feeling would certainly develop amongst the populations of the large towns if they were denied their fair share of political power. It was the same statesmanlike recognition of the altered political condition of the country which dictated Lord Tollemache's remarkable action with regard to allotments and small holdings. Writing to me in 1885, he says:—"It appears that we are advancing rapidly to a democracy. All we must hope and trust is, that whatever happens, it will be conducive to the prosperity and happiness of the mass of the people, and if so, no one ought to complain."

When the movement for giving the labourer three acres and a cow was set on foot, it was largely based upon Lord Tollemache's example:—

Lord Tollemache took the liveliest interest in the progress of the movement, and as early as 1883, before the passing of the Franchise Bill, he separated himself from the mass of the landowners of the country, whether Liberal or Tory, by writing to me as follows:—"Railway directors and dock trustees are given compulsory powers for the purchase of land to enable them to carry out undertakings for the advantage of the public, and for this reason local authorities might be given the same powers for promoting the comfort and welfare of the middle and labouring classes of the district."

The effort which was made to secure voluntary allotments met with his support, but he had little faith in it:—

Lord Tollemache was not unwilling to back up this movement by any means in his power, though he wrote to me, "I have no great confidence in the success of these proceedings"; and at a later period, "I am greatly disheartened at the answers I have received. Landowners cannot at present see that the more they make the new voters owners and holders of land the safer their position will be."

It is this blindness of landowners which constitutes the great dangers of the landed system.

AN EMPHATIC PROTEST.

Mr. W. A. Hedderwick, writing from Park House, Bridge of Allan, says:—

Of all your articles on the Wasted Wealth of King Demos, your appeal to the peers in this month's issue has interested me most. I do not expect there will be any response, and I hope there will be none, for nothing in my opinion could be more adverse to the welfare of King Demos than any movement which might give a new lease of life to such an odious institution as an hereditary aristocracy. The objections to it are manifold, and, with your permission, I mention a few.

1. To confer on any individual a legal right to claim social precedence over his fellow-citizens is simply to confer the right to practise organised vulgarity. You recognise this principle emphatically in the case of the State clergy, and it applies with tenfold force to an hereditary aristocracy.

2. The existence of such a titled and privileged class develops and nurtures an instinct of servility in all other classes. No one will dispute this who admits that an Englishman "dearly loves a lord," or who has witnessed the frantic efforts of the upstart or lickspittle to elbow his way into "Society."

3. The peculiar institution in question sets up a false criterion of merit, which has the effect of debauching the public conscience, or, in other words, corrupting and perverting the moral sense of the nation. Thus the aristocracy are regarded as a body of "chartered libertines," whose moral position cannot be affected by any crime short of sodomy, and even then the authorities, with the public acquiescence, will connive at their escape. It would almost appear that even murder may be committed by a duke with impunity. Recent cases illustrate these propositions.

4. It involves gross injustice to the rest of the citizens, and grave injury to the public interests. In the Army, Navy, or Civil Service, for instance, or even as a candidate for Parliamentary honours, no commoner has a fair chance in competition with one of the chartered libertines. (Of course this is only a phase of the instinct of servility above referred to.)

5. Historically speaking, and in the case of England, the institution is a badge of servitude. Having its origin in the Norman Conquest, it remains as a standing advertisement to all the world that England is a conquered and subjugated nation. The fact that there were titles among the Saxons prior to the Conquest does not affect this position. One would expect a proud and high-spirited race to seize the first opportunity of sweeping away every trace of their humiliation, but they really seem to glory in their shame, for only the other day Tennyson sang of "Norman blood" as the proudest of distinctions.

Instead, therefore, of doing anything to bolster up this debasing relic of feudal barbarism, I think you would be much better employed in declaring, and waging to the bitter end, a war of extermination against the so-called aristocracy and all their works, leaving Nature to provide (as she quickly would) her own genuine nobility of moral and intellectual rank.

A PERTINENT INQUIRY.

Lord W. Compton writes me as follows:—

I am not quite certain that I rightly understand your suggestion to the aristocracy. It is undoubtedly true that the majority of the peers hold themselves aloof from much of the work that is happily going on amongst the people, especially as regards religious work. At the same time they subscribe and do plenty of county work. Your wish is that the aristocracy should hold personal intercourse with the workers, not as patrons from a distance, but as personal friends in their homes. They patronise King Demos instead of serving him—is that your view? I quite agree with it if I have stated it correctly, and agree also that King Demos hates patronage and loves self-sacrificing service. There is a case in point which has often struck me. For many months our peers live in London—a world within a world. Thousand of religious and humanitarian agencies hold meetings as much to obtain sympathy as funds. A titled chairman is eagerly sought. It means an hour or two out of a life of comparative leisure; but how few help!

The Duke of Sutherland writes:—

No doubt it would be greatly to the advantage of the country if all peers could be forced or persuaded to do their duty in a local sense, as some of their number already do. With reference to their legislative functions, why should they not elect, say, 300 of their number, who would form the second Chamber?

ROYALTY EVEN WORSE THAN THE PEEBAGE.

Another earl in the home counties is, however, less sanguine. His letter concludes with a suggestion which makes a novel addition to the "impeachment of the House of Brunswick," of which we used to hear so much when Mr. Bradlaugh was in his prime:—

I have read with very great interest the article you allude to. I cordially agree with every word of it, although it is quite another thing to carry out all its suggestions. The pig-headed Britisher is not easy to move, and this applies especially to the Tory pigeon-shooting landlord. I fear it will be a long time before they will wake up to a sense of their duty. I regret that I cannot at present make any further suggestions, except

to remind you of two excellent articles written about two years ago in one of the magazines, by Mr. Auberon Herbert, entitled "Under the Yoke of the Butterflies," which I think deserve more notice than has been bestowed on them. I fear that these bad times will help to delay indefinitely the bringing about of your ideal. But however much we may wish to blame the shortcomings of the nobility, I venture to think that Royalty is far more blameworthy, owing to its position of social, if not political, head of the nation. One might have hoped and expected that true art in all its forms should be encouraged by Royalties, but they do not. At the State concerts, instead of encouraging the best works of British composers, who I venture to think have a right to expect to be heard, we are dosed with antiquated commonplace excerpts from Italian operas. Mediocrity seems to be the underlying principle in everything undertaken by Royalty. An article from you on this subject might be productive of great good. It would be a very good continuation of your former articles on King Demos.

PEERS CREATED BY KING DEMOS.

Lord Midleton sends me an interesting analysis of the present constitution of the House of Lords, from which it would seem that King Demos has certainly shown his appreciation of his peers by increasing their number materially since he came into possession. The House of Lords had on its roll 401 members in 1830, 433 in 1837; but to-day there are 572 peers in the Second Chamber. Since 1830 there have been 328 new votes added to the House of Lords, of whom 208 were added by Liberal Ministries, and 120 by Conservatives. Mr. Gladstone alone has made 82 peers. It will be interesting to see how many of these Gladstonian peers vote against Mr. Gladstone's Home Rule Bill.

SOME PRESS COMMENTS.

The comments of the press have been somewhat amusing. One well-known editor of a London daily wrote me curtly that he regarded all pleas for the utilisation of the aristocracy as arguments in favour of the personality of the devil. The editor of the *Westminster Gazette* published a "Plea for the Gold Bug," to which I have nothing to say beyond the remark that the comparative merits of the gold bug and the peer cannot be settled by providing the names of half-a-dozen or dozen plutocrats who have founded picture galleries. If we could take our five hundred peers and take the thousands of gold bugs, and see what proportion of each class recognise most their obligations to their neighbours, and to what extent they recognise it, that would be a fair test. But, unfortunately it is impossible, and the case does not admit of scientific demonstration.

A REMINISCENCE OF COBDEN.

The *National Review* says:—

In the August *Review of Reviews* Mr. Stead rediscovers the peers, and finds out that they are not half such bad fellows after all. If they would only let him "run them" he would pull them through—just as he would have pulled the Pope through if his Holiness would have allowed it. Mr. Stead's summary way for restoring power and prestige to the aristocracy is put shortly: "Believe in yourselves and your mission, and freely entertain the local inspectors of nuisances." Fortunately, however, for England, the Peers have never been a noble caste, and consequently would find it very difficult to play at being great nobles, as Mr. Stead seems to desire. The *grand seigneur* never has and never will have a place in England. The House of Lords is not unpopular, as the enemy will shortly discover to their cost; but Englishmen do not like patronage even when most artistically done, and (what is as important) the better sort of Englishmen (which the peers are quite as often as other people) loathe the patronising. Meantime, we entirely agree with Mr. Stead in urging peers and other men of birth and wealth to throw themselves heartily into

politics, local and imperial. They form in both cases excellent leaders, and wise men in England have always realised this. We will make Mr. Stead a present of a little story on this point which may serve him for a motto if he ever republishes his essay. One night in the House of Commons during the forties Mr. Cobden was making an important speech. In the middle he was interrupted by an irruption of the members of the Young England Party who streamed in in all the glory of their white waistcoats and dress coats. He turned to them with an appeal of unusual eloquence, which began, "Your fathers led our fathers at Crecy and Agincourt: why won't you lead us now?" Those were sensible as well as eloquent words, and so far as Mr. Stead's essay echoes them we have no fault to find with it. His advice is indeed singularly apposite at the present moment.

THE GOSPEL OF HATRED AND DISTRUST.

The *Northern Echo* and the *Newcastle Leader* shake their heads in some amusement at the idea of yoking the peer to the chariot of King Demos. *Reynold's*, as befits its traditions, regards the suggestion as flat blasphemy:—

Mr. W. T. Stead's communings with the spiritual world seem to prejudice his sense of things mundane. He has, in a moment of abstraction, devised, strange as it may seem, a sphere of usefulness for the lords of this England of ours. This gang of bloated, overfed aristocrats are, it seems, capable of bringing about the regeneration of England. Mr. Stead suggests that they should throw themselves into the functions of "hereditary leadership," and generally act as commanders-in-chief of the democracy. A nice proposal this, but Mr. Stead may be informed—it is marvellous that he does not already know it—that the democracy of England distrusts, despises, and hates these arrogant, ignorant gentry whom we call the peers.

A TORY PROPHECY.

The *Manchester Courier* moralises over my past from a mountain-top of superior delicacy, wisdom, and man-of-the-world balance, and dwells complacently upon the prospect of my prospective evolution into Toryism, which must be somewhat alarming news for the Tories. Our mentor says:—

We all know Mr. Stead, with his fiery Democratic Radicalism. Most of us regret a certain episode of his career. But the disgusting indecacy, the silly quixotism, and the utter want of man-of-the-world balance and judgment which he then displayed, ought not to blind us to the intense cleverness and insight of the man. To judge from his recent work, with the exception of the "Borderland" nonsense, Mr. Stead is already leaving far behind the eccentricities of his "Sturm und Drang" period. It seems to be a law of nature that the most violent Radicals often make the best Tories as they advance in life, particularly if the world has gone well with them. We trust that this has been the case with Mr. Stead, for his periodical is in many ways a most welcome addition to contemporary literature. Anyhow, it is most pleasing to notice from this whilom Radical so sane and sober an estimate of the present situation that we can only exclaim—Is Stead also among the prophets? Briefly put, Mr. Stead's advice to the peers is to form an Old England party. Possibly a wider acquaintance and a broader charity might teach Mr. Stead that peers, after all, are very much like other men, and that their folly or selfishness is just about the human average. The people would be much better off, he tells us, if the House of Lords were abolished altogether. Mr. Labouchere, it seems, lives in dread of the day when a Duke will oppose him at Northampton, and no doubt he knows his own constituents. But Mr. Stead's argument breaks down at the very point where it might be most useful. It seems to us that the very ground on which the House of Lords may best be defended is the political. If only certain reforms were introduced, including a greater number of life peers and colonial representatives, and if power were given to purge the House of unworthy members, the House of Lords might be of the greatest value even in these democratic times.

SHALL BOUND HOUSES BE FREED?

By A FRIEND.

SINCE the incomplete measure of 1872, no general change has been made in the Licensing Laws of England, although in that time the movement in opposition to the present system of public-house control has been constantly gaining strength, and the outcry against its failure has been steadily growing louder and more insistent, until to-day politicians of every shade, churches of every denomination, and organisations of most diverse character are in absolute agreement that something must be done by the legislature to remedy the everywhere admitted evils arising from the common sale of intoxicating drinks as now carried on. The air is now thick with remedial measures. One Government has tried its hand at a professedly temperance proposal, and another Ministry is attempting to deal promptly and radically with the drink question. Even the publicans are not without a Bill of their own. It might perhaps be said with some show of reason that with so many plans for amending the Licensing Laws before the country, no new one stands any chance of being accepted; but if it can be shown that there is an eminently desirable change possible, which, whilst commending itself to the general public and the moderate drinker, shall at the same time be approved by temperance reformers, and disarm publican opposition, then ample justification is afforded for the publication of such a plan and its due consideration by all who feel called upon to frame an opinion upon the licensing question. The claim of so desirable a remedy to popular attention is enhanced when it is seen that the proposal is immediately practicable of itself, or that it would serve to complement any Government or other scheme for modifying the existing liquor laws.

PAST ATTEMPTS AT SETTLEMENT.

In all the long series of attempts that have been made to render the sale of drink innocuous two features have been always prominent: first, an effort to confine the trade within what the legislature appeared to consider reasonable bounds; and second, to ensure that responsibility should go with privilege. The intention appears to have been that those who reaped the pecuniary benefits associated with the sale of intoxicants were the persons who—whatever otherwise might be affected—should suffer in pocket or in person for any hurtful consequences arising from the accumulation of wealth in this fashion.

THE BREWERS' EVASION OF RESPONSIBILITY.

These primary objects have never been satisfactorily achieved, the one great obstacle and the cause of still further injurious effects having always been the peculiar operations and influence of the manufacturers and wholesale traders in drink. Early in the present century this was manifest, abundant proof of which is found in parliamentary papers of that time. In one of these, the brewers and distillers are shown to have obtained the control of a large number of licensed houses, to have competed with each other for the possession of premises or in the grant of new licences in neighbourhoods already more than fully supplied with drinking facilities, to have palmed off bad beer upon the public through the retailers bound to take whatever might be sent them, and to have connived at, if not to have promoted illegal, disorderly, disgraceful and sometimes even criminal conduct among the frequenters of the retail drink-shops. By placing men in the houses to sell beer at weekly wages; by frequent and even fraudulent transfers, the brewers entirely evaded the responsibilities and penalties the

legislature had placed upon breaches of the Licensing Laws. The Police Committee, reporting to Parliament in the second decade of the present century, say:—

Brewers and distillers, and all who deal in wine and spirituous liquors, make fortunes in proportion to the sale of their respective commodities: the greater the sale the greater the proportionate profit; and it is in evidence before your committee that some of the worst conducted, as well as the most profitable houses in the Metropolis, either belong to particular brewers or are held in mortgage by them; the closer then the connection that is formed between them and the magistrates, the less willing will the latter be to injure the property of the former. The Shadwell case demonstrates that the most disorderly and licentious conduct of the houses belonging to particular brewers does not ensure the loss of the licence; but that if at last, from the notorious infamy of the parties complained against, the magistrates are compelled to interfere, the least possible punishment is inflicted, the tenant is shifted, a real or fraudulent transfer is made, and a new landlord takes possession, to follow the old practices in the same house with aggravated misconduct. The maxim is the house being bricks and mortar cannot be guilty of any moral crime, and the old system is revived with the same profit as before.

THE CHARACTER OF THE "TIED" HOUSE.

Although the majority of witnesses before this committee concur in allowing that there were a far larger proportion of free houses—i.e., licensed premises whose occupiers were free to purchase their supplies from whoever they liked—in the Metropolis than in other parts of the country, yet the evasion of the intention of the legislature that the holder of a liquor licence should be solely responsible for the good conduct of his house, had so largely obtained that it was almost "universal" with most disastrous consequences to the community. At Reading only two of sixty-eight public-houses were free, and at Wallingford four out of eighteen, and elsewhere the "tie" had similarly extended. At these and other places the moral character of the houses in the hands of brewers in the country was "worse than that of free houses," and there was in general "a great difference in the conduct of a brewer's tenant and that of the occupier of a free house, the latter being more tenacious of character, for upon that they can only depend, whereas the tenant of the brewer is generally careless of reputation, trusting to the influence of his landlord to secure to him the continuance of his licence." As to the effect upon the general public of this concentration of the licensing trade within the narrow circle of a few wealthy individuals, far removed from the scene of the distribution of their commodities, "the consequence of this monopoly," avers one witness, "is that the beer is of an inferior quality, and that the poor and middling classes of the community, living in these districts, complain heavily of the badness of the commodity which they are compelled to drink, no other being in the market." The publicans under this system of illegitimate competition were themselves the sufferers, as was made clear by the evidence of a constable, who stated:—"The public-houses in this parish are very numerous, there are more than can make an honest livelihood, without forcing a trade, and several of the publicans," say the committee, "have acknowledged to him that they were compelled to allow disorderly visitors and illegal practices within their houses, for there was not sufficient trade to keep them without."

The Committee make various suggestions whereby "the evils attending the present system may be gradually removed, and the trade taken out of the few hands which in some districts have entirely engrossed it."

They deplore "that the practice is hourly increasing," and they "consider this monopoly to be a great grievance and deserving well the consideration of the legislature in order to limit its further progress, and to relieve the public from its mischievous consequences."

THE FIXING OF RESPONSIBILITY.

Then as in later years the influence of the wholesale monopolist proved too strong to allow of effective legislation, and the problem how safely to allow the common sale of intoxicants without impoverishing the distributors, debasing the consumers, or unreasonably enriching the manufacturers, has yet to be solved. Responsibility for wrong-doing in connection with the sale of drink has never been fairly fixed. The drink-seller, within the memory of the oldest inhabitant, has in the majority of instances always been an intangible personage hidden within the ample folds of a distiller's or brewer's mantle. As the Prime Minister stated at Carlisle on November 6th, 1891:—

The publican in a vast number of instances is nothing more than the commission agent of the brewer. His interest in the business is a comparatively limited interest, but the interest of the brewer is a vast interest, and it is because of that that the greatest mischief attaches to the whole question.

The vastness of the modern brewer's interest in the retail liquor trade has been conclusively proved by the lately published Government Returns obtained upon the motion of Lord Randolph Churchill, which go to show that the sale of beer and spirits has practically passed out of the hands of the men supposed to be responsible for the good conduct of the houses, into those of the brewers and distillers who by the system of legal slavery in which they hold their tenants have secured the monopoly of the public custom. The practice of tying the occupiers of the licensed houses by mortgage deeds full of pains and penalties, and confining the trade to the brewer, who so obtained control of the licence and the premises of the retailer, although deprecated by some of those even engaged in the wholesale drink trade, and, as has been shown, condemned by the parliamentary representatives seventy years ago, has progressed unchecked in spite of the protests of the publican victims of the "grinding monopoly" and complaints by the licensing authority, and the public who have likewise suffered from this restrictive combination.

HOW THE EVIL HAS GROWN.

A great impetus was given to this process of public-house absorption by the extensive movement which originated about half-a-dozen years since, the effect of which was to transfer the capital invested in breweries, and their appurtenances, from private individuals to joint-stock companies possessing greatly enlarged funds. So rapidly did this change take place that it is estimated that more than fifty millions sterling was so invested in the three years following the Guinness boom. The capital of the 186 brewery companies registered in Great Britain up to the year 1892 is given as being £88,838,984, of which £69,721,755 belonged to strictly British companies, the remainder appertaining to breweries in the United States and in foreign countries. If the estimate were brought up to date it would probably not be far out were £100,000,000 stated as the sum total of capital of British limited liability brewery companies. Were the whole truth known it would probably be found that a very small portion of this represents actual value. When the artificially inflated prices at which the concerns were placed upon the market are considered, as well as the fact that by a mere stroke of the magisterial pen in the grant

of liquor licences at Brewster sessions, millions of pounds sterling have been put into the pockets of brewers and distillers, for which no financial consideration whatever was given, the value of the genuine property transferred from speculative monopolists to the investing public will be seen to be but small. So far from the accumulation of capital in the liquor traffic being in any way a guarantee for the good conduct of the places where drink is sold, the position to-day is that many thousands of public-houses are in the hands of men who have no money invested in the business to make them careful as to how the houses are conducted; frequent change of tenancies bearing witness to the ease with which offenders escape responsibility for evasions of the terms of their licence. In thousands of other instances the houses have proved pitfalls into which inexperienced persons with their little savings have been inveigled by brewers' agents, only to be ruined either by the payment of heavy interest on fictitious capital, by enforced submission to exorbitant charges above the market price of goods, or by the loss of the licence when the attempt to make a living by breaking the law has proved unsuccessful.

THE QUESTION OF REFORM.

No effective licensing reform is possible so long as the Bound House system is allowed in its present evil exuberance. The publican victims of the great wholesale monopoly, bolstered up by magisterial sanction, stimulated by the forces of competition, and strengthened by repeated accretions of capital, are the first and loudest in their condemnation of a system which turns the retailers of drink into veritable white slaves selling at the bidding of their masters, the brewers, poisonous raw foreign spirits and adulterated beer as the best quality of alcoholic beverages. Here lies the one solid block to temperance legislative progress, and until this be removed little else can be accomplished. The monopoly of the wholesale men must be destroyed.

Instead of being as now practically the privilege of a few wealthy individual non-residents, or unknown shareholders in a limited liability company, who with magisterial assistance manipulate their houses through dummy licensees—or to quote one of the trade speakers "five bob managers"—regardless of the well-being of the nation, the health of their customers or the prosperity of their agents; the sale of drink, where allowed, should be in the hands of real resident occupiers, responsible persons who should be at liberty to purchase food or drink wherever and from whomsoever they pleased, and to sell the same consistent with the existing Licensing Laws free from control by any over-lord.

If the individual were licensed rather than the house, no brewer or distiller could dictate to the publican what sort of drink he should purchase, what price he should pay, or how much in quantity he should sell. He would be free to sell light wines instead of spirits, or slightly alcoholised ale instead of strong beer. He could choose his customers, and reject the disorderly, the drunken, or the dissolute. He might close his public-house on Sunday except for sale off the premises or at dinner time and supper time, or he might even take out a six-day and early-closing licence, and in other ways meet the public demand for a general change in the conduct of licensed houses. The occupier of the house under this proposed system being the owner for the time being of the licence, could, with magisterial sanction, remove his business at will to other premises, and thereby escape the pressure put upon him by the brewer to push the trade at all hazards.

THE ROYAL ROAD TO LANGUAGES.

THE interest which has been aroused by the publication of the examination of my children on the result of their training by M. Bétis on M. Gouin's Series Method of teaching foreign languages (which I have called in the REVIEW the Royal Road to Languages) does not seem to abate.

REPORT OF A GOVERNMENT INSPECTOR.

The following letter from Mr. Richard W. Waddy, M.A., of the Abbey School, North Berwick, who has had the method in practice for the last year, will be read with interest by those who are inquiring as to the usefulness of the method when conjoined with the present examination system. Mr. Waddy says:—

(1) I hold to all I said before as to the pleasantness and interest of the system both for teacher and taught. It rendered our school work distinctly livelier, happier, and more instinct with the real pleasure of learning. There was a sense of freedom from the numbness of dead books, and rules, and exercises that was felt and enjoyed from the first to the last. Personally I never had so pleasant a spell of work.

(2) In the next place, I can say now, what was not in my power before, that the system can be used confidently, even where Government inspectors have to be faced, and examinations prepared for in which written papers only are required, and not conversational facility—though, of course, more attention must be paid to the grammar in this case.

In French, exclusive of a small class of very little boys for whom the teacher constructed easy "Series," which they learned with great pleasure and success, we had three classes under instruction, aged 11½, 13½, and 14½ years respectively.

In all these classes the amount of work done compared favourably with that of former years, whilst the *accent* in all three was distinctly and decidedly improved. In the youngest class, a boy who had learned no French before was constantly at the head of the form, though some of the other boys had been in French for one or two years previously. In the middle class, a little boy of nine was well to the front, though he knew little or no French before joining, and was put in the class for his acquirements in Latin. I consider these two cases, and the fact that in the Senior Class new-comers easily held their own, good instances of the equalising effect of the method amongst boys of unequal age and attainment. In the two younger classes no translation was done, but in addition to a large number of series, formal grammar to the usual amount was easily acquired, and better understood.

The Government Inspector reports that the facility of the classes in these Series was "*remarkable*," and in the class-room he used, of one class, the word "*incredible*." After the first three months little English was used in class, even in the youngest, and the examination, except in formal grammar drill, was conducted in French also. In the Senior Class (14½ years)—with the exception of one lesson a week in French literature to three boys preparing for the Government Leaving Certificate Examination—only Series were studied, the three candidates, however, writing exercises in continuous French prose.

During May and the first half of June the three candidates prepared formal grammar, and the Series were revised by the rest of the class, and some French was translated. With this preparation, two of the three candidates obtained leaving certificates in French (lower grade) in June. I may add that I used to read aloud to this class Mrs. Hugh Bell's little book of French plays, which were translated into English by the boys, who found them very amusing, as indeed they are.

John Kerr, LL.D., H.M. Senior Inspector of Schools in Scotland, examined the school in July, and reported as follows to "my lords":—"French is taught on Gouin's Series System to the whole school. The system is new to me, and I do not feel warranted in giving a decided opinion as to its merits, especially as it is necessarily, in the circumstances, only partially carried out [I have detailed above the only *partial* alterations, which were greatest in the senior class], and has been

in operation only one session. I may say, however, that it seems to me the natural way of acquiring conversational facility in the use of a language, and that it is certainly interesting to the pupils. Even in the preparatory class (average age eight) the accuracy of pronunciation and the ready use of simple common phrases was remarkable. Sentences increasing in number and difficulty are taught from the lowest class upwards, till in the highest a very considerable vocabulary is acquired."

Mr. Waddy continues: "The question of time is, to my mind, the only difficulty in the matter. Granted a sufficiency of time each day, and that a boy can learn a language well and soon after this method, I have no doubt. But so long as a boy is permitted to potter away at two or three languages without devoting time enough for tangible results to any one of them, no rapid or real progress can be hoped for. One language at a time, and plenty of it, during a year is what will be sought for in vain in time-tables constructed for average boys, who are trying to learn several foreign tongues in their own land, in the way by which we have, until the present, understood the learning of languages. It is just this plan of learning languages, one at a time effectually, and not two or three at a time to no purpose, that seems to me a cardinal truth made very plain by M. Gouin."

A CENTRAL SCHOOL OF FOREIGN TONGUES.

So, far, however, the public have not been able to obtain and judge the benefits of the new method; but I understand that so many inquiries have been received from private persons tired of dictionary and grammar, and desirous of availing themselves of Gouin's "mental linguistic locomotive," that a Central School of Foreign Tongues has been established by Mr. Howard Swan and M. Bétis, at Howard House, Arundel Street (near the Temple Station), where classes on the system are now started, and the training courses for teachers will be continued. Afternoon and evening classes will therefore be carried on in French and German—and in Spanish and Italian also, if required—for students or beginners, by M. Bétis and a staff of trained teachers, for two hours or so twice a week, at the fee of twenty-five shillings a month. These classes are to enable students not knowing a word of the language to understand, speak, and write it at the end of a year. It is probable there will be also a class for those who wish to learn a language in the shortest time possible, at two hours a day, five days a week.

For those—and many present day students are in this plight—who read, but as for the spoken language cannot understand nor speak, the oral classes on the Series will give what they require, while oral literature lessons on the modern and classical authors will also be carried on in French and German, for those who knowing the language somewhat wish to improve that knowledge; and any who wish can have private instruction. A free lecture, with demonstrations of the oral lessons, in several languages, was announced for September 4th, and another will be given on Monday, September 18th, at 7.45 p.m.—admission by sending name in advance. An evening teachers' class for London teachers will be held once a week, beginning in October, and applications are invited.

I suppose that foreign notabilities or students who desire to learn English will also be accommodated, as it is to the English language that the Dutch, Norwegian, Japanese, and Indian correspondents who have written to me will desire to apply their teaching.

M. Bétis is still also carrying on his experimental demonstration in boys' public school teaching at Trent College, which will continue till Christmas, when an examination of the kind known to my readers will be held.

THE REVIEWS REVIEWED.

THE NINETEENTH CENTURY.

I NOTICE Father Clarke's article on "The Verdict of Rome on 'Happiness in Hell'" elsewhere. There are several articles of considerable interest, which read pleasantly but do not lend themselves to brief notice in the present column. Canon Knox Little replies to Mrs. Humphrey Ward's paper in the July number of the *Nineteenth Century*; he calls his paper "Protestant Science and Christian Belief." The Countess of Jersey describes "The Transformation of Japan," and Mrs. Cunninghame Graham, whose pen I am delighted to see once more, describes the life of one George Leslie, a Scotchman, who was converted to Roman Catholicism at the beginning of the 17th century, and died as Father Archangel, a Capuchin friar, in the north of Scotland. He had gone there in order to convert the Aberdonians to Rome. Mr. William Sharp writes an article on "La Jeune Belgique," and gives an interesting account of the literary movement which is so remarkable in Belgium at the present day. Baudelaire, says William Sharp, is the tutelary god of young Belgium. Judging from what Mr. Sharp says, it would not have been a misfortune if young Belgium had never grown up, but had perished in its cradle. Mr. Cole's paper on poaching is a bright piece of description of the facts of one side of the life of the fields.

HOW SHOULD NOVELS BE WRITTEN.

Mr. Benson, the author of "Dodo," discusses this question under the title of "A Question of Taste." Mr. Benson says:—
